VAN VORST COLLECTION

From Mr. EDWARD ARNOLD'S LIST.

JUST PUBLISHED.

A NOTABLE NEW WORK—ON ORIGINAL LINES.

MIDWIFERY

UNDER THE DIRECTION OF

COMYNS BERKELEY, M.A., M.D., M.C. Cantab., F.R.C.P. Lond.,

Obstetric and Gynæcological Surgeon to Middlesex Hospital, &c., &c.

EDITED BY

COMYNS BERKELEY, H. RUSSELL ANDREWS, AND J. S. FAIRBAIRN.

Contributors:

H. RUSSELL ANDREWS, M.D., F.R.C.P., Obstetric Physician to the London Hospital.
J. D. BARRIS, M.R.C.P., F.R.C.S., Assistant Physician-Accoucheur, St. Bartholomew's Hospital.
COMYNS BERKELEY, M.D., M.C., F.R.C.P. (see above).
VICTOR BONNEY, M.S., Assistant Obstetric and Gynæcological Surgeon to the Middlesex Hospital.
***HAROLD* CHAPPLE,** F.R.C.S., Obstetric Surgeon to Guy's Hospital.
G. F. DARWALL SMITH, F.R.C.S., Assistant Obstetric Physician to St. George's Hospital.
STANLEY DODD, M.R.C.P., F.R.C.S., Assistant Obstetric Physician to Westminster Hospital.
J. S. FAIRBAIRN, F.R.C.P., F.R.C.S., Assistant Obstetric Surgeon to St. Thomas's Hospital.
T. G. STEVENS, M.D., M.R.C.P., F.R.C.S., Obstetric Surgeon to St. Mary's Hospital.
CLIFFORD WHITE, M.D., M.R.C.P., F.R.C.S., Senior Physician for Out-patients to Queen Charlotte's Hospital.

728 Pages. With more than 300 entirely new Illustrations. **18s. net.**

This work marks a new epoch in Students' Text-books, inasmuch as the whole of the book represents the considered views and the teaching of all the ten authors whose names appear on the title page. It must not be considered an ordinary work by ten contributors, as every branch of the subject, text and illustrations, has received full and adequate discussion by all the authors and represents the fruits of their wide experience as Teachers at eight of the large London Hospitals and the three large Lying-in Hospitals. The work can therefore be considered to have reached a high level of authority and uniformity.

New and greatly Enlarged Edition of this Standard Work is NOW READY.

MALINGERING

By Sir JOHN COLLIE, M.D., Colonel, R.A.M.C.,

Medical Examiner, London County Council; Chief Medical Officer to the Metropolitan Water Board; President of the Military Board on Neurasthenia, &c., &c. **16s. net.**

MEDICAL DISEASES OF THE WAR

By Major ARTHUR F. HURST, M.A., M.D.Oxon., F.R.C.P.,

THE DIAGNOSIS OF NERVOUS DISEASES

By PURVES STEWART, C.B., M.A., M.D. Edin., F.R.C.P.,

Physician to the Westminster Hospital; Consulting Physician to H.M. Forces; Temporary Colonel, A.M.S.

With 283 Illustrations from Original Diagrams and Clinical Photographs. 589 pages. Medium 8vo.
18s. net. NEW (FOURTH) EDITION, EXTENSIVELY REVISED.

New and Revised Edition of this well-known Text-book.

SURGICAL NURSING AND THE PRINCIPLES OF SURGERY FOR NURSES

By RUSSELL HOWARD, M.B., M.S., F.R.C.S.,

Assistant Surgeon to the London Hospital, and Lecturer on Surgical Nursing to the Probationers of the London Hospital.

NEW EDITION, Thoroughly Revised and Fully Illustrated. xvi. + 318 pp. 6s.

London: EDWARD ARNOLD, 41 and 43, Maddox Street, Bond Street, W. 1.

Lancet.—"We have nothing but praise for this Annual."

Thirty-fifth Year. Fully illustrated in Colours, and Black and White. **NOW READY. 10/- *net.***

MEDICAL ANNUAL, 1917

A YEAR BOOK OF TREATMENT AND PRACTITIONER'S INDEX:
Arranged in Alphabetical order for Easy Consultation.

Contributors:

E. WYLLYS ANDREWS, A.M., M.D., *Chicago*; JOSEPH G. BLOMFIELD, B.A., M.D.; FRANCIS D. BOYD, C.M.G., M.D., F.R.C.P.; **FRANCIS J.** CHARTERIS, M.B., B.Ch.; JOHN D. COMRIE, M.A., M.D., F.R.C.P.; LEWIS A. CONNER, Ph.B., M.D., New York; CAREY F. COOMBS, M.D., F.R.C.P.; W. H. DOLAMORE, M.R.C.S., L.R.C.P., L.D.S.R.C.S.; JOHN S. FRASER, M.B., Ch.B., F.R.C.S.; W. E. FOTHERGILL, M.A., M.D.; DAVID McV. FLECK, M.B., Ch.B.; HERBERT FRENCH, M.A., M.D., F.R.C.P.; EDWARD W. GOODALL, M.D., B.S.; C. THURSTAN HOLLAND, M.R.C.S., L.R.C.P.; **J. RAMSAY** HUNT, M.D., New York; ROBERT HUTCHISON, M.D., F.R.C.P.; FREDERICK LANGMEAD, M.D., F.R.C.P.; E. G. GRAHAM LITTLE, M.D., F.R.C.P.; CHARLES FRED. MARSHALL, M.D., F.R.C.S.; BEDFORD PIERCE, M.D., F.R.C.P.; JOSEPH PRIESTLEY, B.A., M.D., D.P.H.; SIR LEONARD ROGERS, Lt.-Col. I.M.S., M.D., F.R.C.S., F.R.C.P., Calcutta; A. HUGH THOMPSON, M.A., M.D.; J. W. THOMSON WALKER, F.R.C.S.; **W. I. DE** COURCY WHEELER, B.A., M.D., F.R.C.S.; A. GASCOIGNE WILDEY, Dep. Surg.-Gen. R.N.; MARGUERITE WILSON, M.B., Ch.B., Glasgow.

This year's volume has a unique value. It is a faithful digest of current Medical and Surgical thought, and hence is coloured of necessity by the War. But War problems will confront the Practitioner on every hand, and he must be prepared to deal with them. Such a digest cannot be obtained elsewhere.

UNIFORM IN SIZE WITH THE "MEDICAL ANNUAL." **8/6** *net.*

"A FIRST-RATE ACQUISITION FOR EVERY PRACTITIONER."

THE MEDICAL ANNUAL SYNOPTICAL INDEX

TO REMEDIES AND DISEASES for the Ten Years 1905 to 1914:
together with a Dose Index in Imperial and Metric measures in accordance with the British Pharmacopœia, 1914, and indicating the alterations that have been made.

Subscribers now serving abroad can have a copy reserved on sending a post card to the Publishers. Payment and delivery can await their return if desired. As this work, in addition to its own valuable information, renders every fact contained in the ten volumes of the Annual immediately available for reference, the Publishers will gladly reserve the remaining copies for Subscribers to the Annual who possess the volumes to which it refers.

OPINIONS REGARDING THE PRECEDING VOLUMES.

Reading. "I desire to congratulate you . . . of the greatest use to all busy practitioners, and to those wishing to refer to details of methods of treatment."
Glasgow. "I am delighted with this book: medical men must find it a treasure." *Guildford.* "Will be of the greatest possible use, and is most capitally done."
"It is by no means necessary that the reader should possess all the numbers to render this volume of use—it is a work in itself, and contains a vast amount of information."—*Lancet.*
"A perfect gem of an index, with cross references. The multitude of facts compressed into the small compass of its four hundred pages makes the book one of permanent value."—*Medical Press and Circular.*

Kidney and Abdominal Protector

M.D., F.R.C.S. Eng., writes:—

"This Protector is designed for the use of men and women. Covering the abdominal and pelvic organs, it will prove useful to those men who are exposed by their occupations to the vagaries of the weather, especially when the occupation involves sitting or standing for long periods. To adult women of all ages and to adolescent girls it will be a safeguard against the special ailments which are so liable to be brought on by exposure to cold." *From Principal Chemists.*

GERMAN WINES!

were recommended by the Medical Profession
. . BEFORE THE WAR . .

TOURAINE AND ANJOU WINES

(from the Garden of France)

EFFECTIVELY REPLACE THEM.

They are LIGHT, NATURAL, ABSOLUTELY PURE, and in every respect identical in character and style with Hocks and Moselles. They possess similar dietetic properties

THE LANCET, in its issue of April 21st, 1917, page 617, reports upon six samples of these wines examined in its Laboratory, and says that the results obtained "**bear out fully the claims that these French wines are, in regard to special dietetic requirements, not at all inferior to the German produce, and in certain respects they are superior.**" "**They are light, elegant, and practically non-acid.**"

OBTAINABLE FROM ALL STORES, WINE MERCHANTS, &c.

Trade "BACTEROL" *Mark*

THE MOST EFFICIENT ANTISEPTIC AND GERMICIDE.

Non-Toxic, Non-Irritating, Non-Staining, Non-Corrosive, Non-Greasy, Deodorant.

IN SURGERY & MEDICINE, USE THE MEDICAL TYPE.

"BACTEROL" (Medical) is a preparation based upon infusions of Eucalyptus and Alpine Peppermint, combined with Formaldehyde and Iodine, and prepared and modified by special processes at a high temperature.

"BACTEROL" is a perfectly stable and neutral product of a non-poisonous, non-caustic, non-corrosive, and non-irritating character. It promotes granulation, and its use quickly produces perfect asepsis. "BACTEROL" is in a class by itself, and can be used in every condition. It unites the advantages of all antiseptics, bactericides, and deodorants in current use, but is entirely free from their objections, while it possesses many advantages entirely its own.

Owing to its high concentration, "BACTEROL" is very economical in use, and when working with solutions of 1 in 1000 or 1 in 500 its cost is almost negligible.

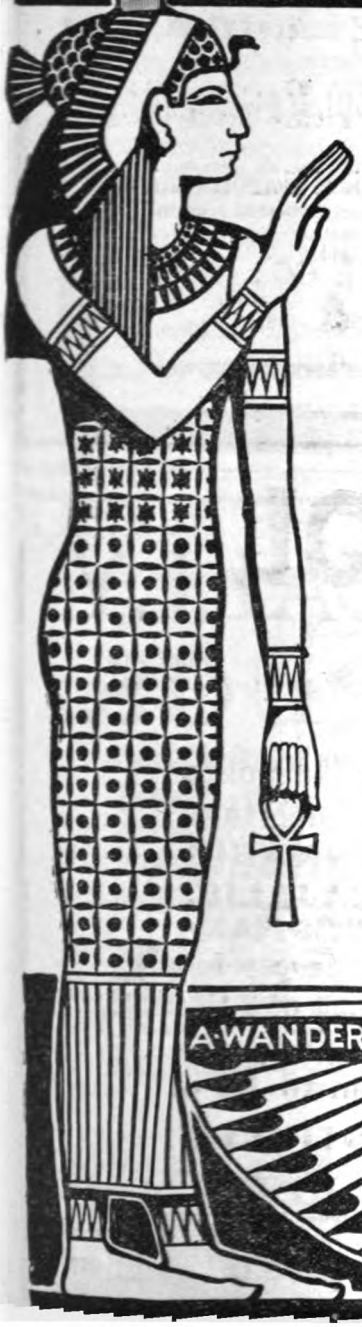
ISSUED in 2-oz. bottles - price 2/3
„ 4-oz. „ - „ 4/-

IN HOUSEHOLD & SICK-ROOM USE THE GENERAL TYPE.

"BACTEROL" (General) effectively sterilizes surgical instruments without detriment to their edge or polish. It has no injurious effect upon vulcanite, horn, rubber, or in fact any substance. It sterilizes the hands of Surgeons, Nurses, &c., without roughening the skin.

Owing to its non-poisonous and other advantageous characteristics, "BACTEROL" may be freely employed with great benefit in cases where the use of ordinary disinfectants is highly objectionable; being non-corrosive and non-irritating, it may be advantageously used in the sick-room for the patient's bathing and washing operations, the disinfection of linen, dressings, bowls, &c.

For Institutional use "BACTEROL" (General) is ideal. It is a "favourite" with Nurses as it does not roughen the skin.



ISSUED in 10-oz. bottles - price 2/-
„ 40-oz. „ - „ 6/-

Samples and Literature on Application.

OVALTINE
FOR SLEEPLESSNESS

AVOID A LATE HEAVY MEAL AND TAKE A CUP OF "OVALTINE" IMMEDIATELY BEFORE RETIRING . . . . . .

This prescription has proved in numberless cases of great help in securing light, healthy and refreshing periods of slumber.

"OVALTINE" is highly nourishing, but causes no active digestive function. It is prepared by simply dissolving the granules in hot milk and water; there is no troublesome cooking or other preparation.

A British Product. Obtainable from all Chemists

M 69a

A. WANDER LTD 45 COWCROSS ST. LONDON E.C.

"It's a condition that confronts us, not a theory"

When you are called to a case of DYSMENORRHEA, it is a condition that demands something more than theory.

You demand results from the remedy administered.
Your patient demands relief from pain.

HAYDEN'S VIBURNUM COMPOUND

has for years enjoyed the confidence of recognized authorities as a dependable remedy in DYSMENORRHEA, MENORRHAGIA, RIGID OS, THREATENED ABORTION and other GYNECOLOGICAL and OBSTETRICAL conditions where indicated.

Administered in hot water, teaspoonful doses, it will, if given a trial, enjoy and retain YOUR confidence.

Formula, literature and sufficient supply for clinical demonstration sent on request.

CLINICAL PATHOLOGY AND RESEARCH

The Staff of the Virol Research Laboratories, which are under the control of a Medical Superintendent, consists entirely of qualified members of the medical profession with special experience in their own departments; every specimen submitted is examined and the report thereon signed by the actual investigator. The work is done exclusively for the medical profession, and in no case is any information given to the patient.

The buildings are structurally exceptionally well equipped and are open to inspection at any time during working hours by qualified members of the medical profession, who are also invited to make use of the library and reading room. Demonstrations of pathological methods are given from time to time by the Medical Superintendent.

The scale of fees has been designed to bring laboratory facilities within the reach of every class of patient which comes under the ægis of the Medical Practitioner.

A price list will be sent on application. Specimen charges are as follows:—

SYPHILIS:	Detection of spirochæta pallida in scrapings from the cold lesion by the ultra-microscope and stained films	5/3
	Wasserman Reaction on the blood	5/3
GONORRHŒA:	Detection of the organism in pus	2/9
DIPHTHERIA:	Microscopical and cultural examination of swab	1/3
TUBERCLE:	Examination of sputum for T.B.	1/3
AGGLUTINATION TEST	for typhoid, paratyphoid, &c. ...	2/3
BLOOD:	Examination of spread films with differential count of leucocytes	7/9
TUMOURS, &c.:	Report with mounted paraffin section ...	6/3
URINE:	Simple qualitative examination with microscopical examination of centrifugalized deposit	4/9
AUTOGENOUS VACCINE	with twelve graduated doses ...	21/3

ENTERO-COLITIS

ESPECIALLY IN CHILDREN

is promptly relieved and the road to recovery is made safe and comfortable by the application of hot Antiphlogistine over the entire abdominal wall.

produces a depletion of the enteric and peritoneal vessels and stimulates the solar and hypogastric plexuses, relieves the tenesmus, the muscular rigidity, and the pain.

ATHLETIC CONTUSIONS

Sprains — Strains — Spike Wounds — Traumatic Synovitis—Myalgia, and other congestions due to athletic and outdoor activities, yield promptly to the application of hot Antiphlogistine.

THE DENVER CHEMICAL MFG. CO., BOW, LONDON, E.3.

Prescribed by the Medical Profession for 35 years.

The BRITISH MEDICAL JOURNAL says:
"Time and use have justified the claims put forward for these preparations."

BENGER'S FOOD—

Describing how and why it is different to all others.

BENGER'S FOOD is a specially prepared wheaten food with which is combined two active natural digestive principles (enzymes), viz., Amylopsin and Trypsin. It is devised to be used in conjunction with fresh cow's milk, which it enriches and partially digests (more or less as desired) before consumption.

ITS ADVANTAGES. It provides a freshly prepared and delicious food cream, entirely free from irritant particles, of delicate biscuit flavour, and incapable of forming heavy curd when in contact with the acid contents of the stomach. While it is a most easily assimilated food, it is most nourishing.

ITS USES. It is relied upon in stomach and intestinal complaints and infectious diseases, and, as a supplementary food, it is especially valuable in minor ailments and mal-nutrition. For nursing mothers, it is very valuable, and is most successful as a transfer food at weaning.

BENGER'S Food *for* INFANTS, INVALIDS, AND THE AGED.

is sold throughout the World by Chemists, &c., in sealed tins, price 1/-, 1/6, 2/6, 5/-, and 10/-.

A physician's sample, with full particulars, will be sent post free on application to any member of the medical profession.

N.B.—BENGER'S FOOD is the direct outcome of the pioneer work on digestive ferments, by the late Sir William Roberts, M.D., F.R.S. and the late Mr. F. Baden Benger F.I.C., F.C.S. in 1880, since when it has been the premier dietetic preparation of its kind in the British Empire.

M 78 a

ALL REACTIONS of the body fluids and tissues are COLLOIDAL.

"Before a drug can exert its full therapeutic action it is necessary for it to become converted into the colloidal state."—Dr. ——— in the BRITISH MEDICAL JOURNAL, 19th May, 1917.

CROOKES'

COLLOSOLS are Drugs in the Colloid State.

COLLOSOLS are isotonic and isomorphic with the elements of the body.

COLLOSOL IODINE is superior to organic Iodine Compounds and Iodides. It is directly assimilated into the blood stream and is wholly absorbed. It never causes Iodism.

COLLOSOL IODINE AQUEOUS (1-500). Specially indicated for internal administration, and for prior intravenous injection in SYPHILIS. In CANCER the intravenous injection of Collosol Iodine relieves pain even where large dosage of morphine is ineffective.

COLLOSOL IODINE OIL and OINTMENT (3%). Specially indicated for parasitic affections—also for TRENCH FOOT. The Iodine particles penetrate the pores of the skin without staining the epidermis, which is kept supple.

COLLOSOL IODINE PASTA. Prepared in glyco-gelatin base forms a colloidal antiseptic skin, when heated and applied to the part affected. Is indicated in WOUNDS, BURNS, and SORES.

COLLOSOL SULPHUR for internal administration and hypodermic injection.

COLLOSOL SULPHUR BATHS

have the highest medical recommendation

in all forms of RHEUMATISM and other fibrositic conditions. They are also specific in SKIN affections.

COLLOSOLS are prepared for the Proprietors, Crooke's Collosols Ltd., at

THE CROOKES' LABORATORIES

50, Elgin Crescent, LONDON, W. 11.

Phylacogen Therapy

Phylacogens are sterile aqueous solutions of metabolic substances generated by bacteria grown in artificial media, and from which the bacteria have been carefully removed by filtration.

RHEUMATISM PHYLACOGEN

Has proved remarkably effective in the treatment of various forms of rheumatism not due to specific infection, also of arthritis, sciatica, lumbago, chorea, neuritis, iritis, &c. Numerous cases of arthritis deformans have been benefited, many of which had resisted all other methods of treatment for 5, 10, and even 15 years.

GONORRHŒA PHYLACOGEN

Specially indicated in chronic gonococcal infections and their sequelæ, such as gonococcal arthritis and iritis, prostatitis, epididymitis, vesiculitis and cystitis in the male; and vaginitis, cervicitis, endometritis and salpingitis in the female. In cases of acute urethritis treatment requires to be supplemented by germicidal injections, such as argentide or protosil.

MIXED INFECTION PHYLACOGEN

The hypodermic administration of Mixed Infection Phylacogen is indicated in all infections, acute or chronic, mild or severe, in which no specific micro organism is found to be predominant, notably in surgical infections, abscesses, puerperal sepsis, diseases of the skin—acne, eczema, impetigo, sycosis; diseases of the nose and ears—suppurating antrum, otitis media, rhinitis, catarrh, &c.

PNEUMONIA PHYLACOGEN

Indicated in the treatment of pneumonia or of any pathological condition caused by the pneumococcus.

Recent reports from English practitioners show that it is rarely necessary to give more than four injections of ½ to 1 c.c. each before the temperature falls. Of 21 cases reported during the past three months there was only one death—a young man in whom the pneumonia was complicated with mitral disease.

ERYSIPELAS PHYLACOGEN

The hypodermic administration of Erysipelas Phylacogen is indicated in the treatment of erysipelas, the acute infectious disease caused by streptococcus erysipelatis.

Further particulars, with Clinical Reports, will be found in our booklet entitled "Phylacogen Therapy," which will be sent to any Medical Man on request.

The Phylacogens are supplied in 10 c.c. phials, each containing from 4 to 6 doses, and in cases of 5×1 c.c. ampoules

PRICES.

Phials of 10 c.c., 11/8 each.

Cases of 5 × 1 c.c ampoules, 7/- per case.

Subject to 10 per cent. discount to Medical Men.

Antiseptic Cream
(HEWLETT'S).

A delicate antiseptic emollient healing Cream, instantly relieving the itching and burning sensation of the skin in cutaneous diseases. In all cases of roughness and irritation of the skin its healing and soothing properties are widely recognised.

In collapsible tubes, 12/- per doz.,
or 10, 22, 40, and 90 oz. Jars, 4/6 per lb.

Mist. Hepatica Conc.
(HEWLETT'S).

Invaluable in Chronic Biliousness, Jaundice, and all torpid conditions of the liver.

Useful in Constipation, especially when accompanied with depression and general *Malaise*. Does not cause griping or sickness.

DOSE: 10 to 60 minims.

In 10, 22, 40, and 90 oz. Bottles.

Hewlett's Lysol.
KNOWN FOR MANY YEARS AS
SURGICAL "CREOSALGEN."

An Ideal Antiseptic and Germicide, mixing bright and clear with water.

In 5 oz., 10 oz., 20 oz., and 32 oz. Bottles, and ½ gallon and 1 gallon Canisters.

UNG. CREOSALGEN contains 2% Lysol, and is most useful as a healing ointment.

ANGIER'S EMULSION

PETROLEUM WITH HYPOPHOSPHITES

In this remedy you have an agent that will heal intestinal lesions, correct perverted metabolic action, promote absorption, assimilation, nutrition, and restore tone to all the digestive functions. The creation of appetite and the return of normal digestion is quickly brought about by its regular use.

The Emulsion is particularly useful where convalescence is retarded by minor nerve complications. Under its use, patients suffer less from sleeplessness, are less inclined to be low spirited or melancholic, and general progress is more satisfactory.

An absolutely perfect Emulsion, it is presented in a form pleasing to the taste and acceptable to the most fastidious. Moreover, its good effects are accomplished in a safe and natural manner without entailing extra work upon the weak or overburdened system.

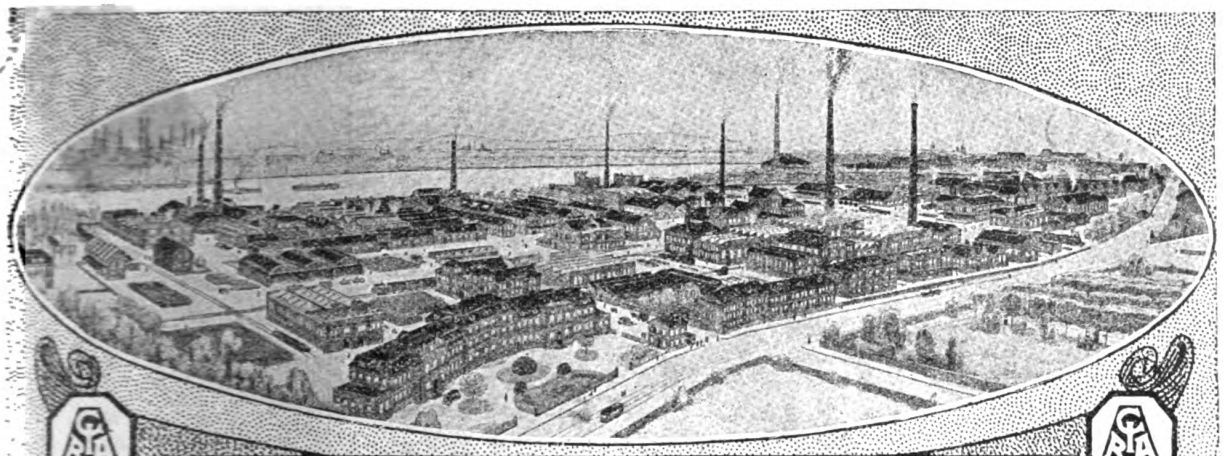
COMMUNICATIONS:
Academy of Medicine, Paris, 10th Nov., 1908.
Academy of Sciences, Paris, 14th Dec., 1908.

URIC ACID is never found free in the organism. It always exists in a state of combination with Soda, Ammonia, &c.; it forms biurates or quadriurates, which are complex and not easily soluble.

URODONAL



by reason of its special composition, is able to effect the double chemical decompositions which liberate the Uric Acid from the combinations where it is fixed and cause it to be easily eliminated in the urine.

URODONAL is a most powerful solvent of **URIC ACID,** because it can destroy its organic combinations.

URODONAL.—Price 5/- and 12/- per bottle (latter size equals three 5/- bottles).
Prepared exclusively by J. L. CHATELAIN, Ph. Chemist, 2 & 2 bis, rue de Valenciennes, Paris.
Can be obtained from all Chemists and Stores, or from the London and Colonial Agents, Heppells Foreign Chemists, **164, Piccadilly, W.**

PHARMACEUTICAL PRODUCTS
"CIBA" BRAND

Dial-Ciba

A prompt and efficient hypnotic and sedative. Dial acts in smaller doses than the usual hypnotics and causes no after-effects.

Diallyl-barbituric Acid or Diallyl-Malonyl Urea.

Nervous and Post-Traumatic Shock, Insomnia, Nervous Affections, Psychoses, etc.

Dose, as hypnotic: 1 to 2 tablets about an hour before bed-time.

As sedative in nervous-excitement: 1/2 to 1 tablet three times a day.

Dial-Ciba tablets, 1 1/2 grain, in tubes of 12 and 50 tablets.

Lipoiodine-Ciba

A tasteless, chemical combination of Iodine with a fatty acid compound, containing 41 % of the former. Lipoiodine passes through the stomach without causing irritation and slowly yields up its Iodine in the intestine. Lipoiodine causes no Iodism, as is often the case with Potassium or Sodium Iodide, and acts in much smaller doses.

Syphilitic and Cardio-Vascular Affections, Asthma, Scrofula, etc.

Lipoiodine-Ciba tablets, 5 grains, in tubes of 10 and 20 tablets.

Digifolin

Digifolin contains all the glucosides of Digitalis leaves in their natural proportions. Digifolin is freed from extractive principles, present in the tincture and infusions and which are responsible for gastro-intestinal intolerance.

A Standardised, constant and permanent Digitalis Preparation for Internal, Subcutaneous and Intravenous Administration.

Digifolin „Ciba" tablets, in tubes of 12 and 25 tablets. Each tablet represents 1 1/2 grains standardised Digitalis leaves.

Digifolin „Ciba" ampoules (1 cc.), in boxes of 5 and 20 ampoules. Each ampoule represents 1 1/2 grain standardised Digitalis leaves.

Digifolin „Ciba" liquid, in vials of 20 cc.
1 cc. represents 1 1/2 grain standardised Digitalis leaves.

OBTAINABLE FROM ALL CHEMISTS AND STORES.

Byno Cascada

(Trade Marks)

The Ideal Tonic Laxative and Nutrient Digestive.

"BYNO CASCADA" presents the stimulating tonic laxative principles of the finest Cascara Sagrada and Rhamnus Frangula incorporated in "Bynin" pure active liquid malt.

The gentle, yet persistent, tonic effect of Cascara on the intestinal muscle, reinforced by the influence of "Bynin," in promoting the digestion and assimilation of food, renders "Byno Cascada" the ideal prescription to ensure normal bowel activity.

Equally valuable in childhood, in pregnancy, for nursing mothers, and in old age, "Byno Cascada" is preferred in scientific treatment.

Issued in Bottles at

3/- and 5 6.

'Bynogen'

Trade Mark

Brings Health

The Improved Casein-Glycerophosphate Food

Recommended in all Enfeebled Conditions, Mental and Nervous Exhaustion, Insomnia, Convalescence after Illness, etc.

"Bynogen" is a highly concentrated food of acknowledged value. It is specially rich in phosphorus, which is present in the condition in which it is found in brain substance and other nervous tissues.

Formula:

Pure, Soluble Milk Protein - 75 per cent. Sodium Glycerophosphate 2 per cent.
Dextrin-Maltose (specially prepared) 20 ,, Calcium Glycerophosphate 2 ,,
Magnesium Glycerophosphate 1 per cent.

Advantages:

Physical.

Possesses a most attractive flavour and aroma, mixes readily with milk, water, and other fluids. May be eaten dry, if desired, or sprinkled on articles of solid food. Keeps good indefinitely.

Therapeutic.

The percentage of Nitrogen is high. The Carbohydrate is in the most easily assimilable form. The mixed Glycerophosphates present the inorganic bases common in food-stuffs and do not cause constipation.

Medical Men are invited to write for samples of this unique Nutrient and Nerve Restorative.

Obtainable from all Pharmacists, in bottles with cartons at 1/9 and 3/- each.

Sole Manufacturers:

Allen & Hanburys Ltd., Lombard Street, London, E.C.

West End House: 7, Vere Street, W.

Carnrick's Liquid Peptonoids

BEEF, MILK, and WHEAT (Pre-digested).

A Sustaining, Stimulating, and Palatable auxiliary food, rich in all the nutritive principles of Beef and Wheat (except the fat) pre-digested by Pepsin and Pancreatin; ready for immediate absorption and assimilation, especially useful for the restorative feeding of patients unable to digest food in any other form.

INDICATIONS.—In crises and exhaustion; all cases of gastro-intestinal disease; pneumonia; and as a colonic nutrient.

Of "Liquid Peptonoids" THE LANCET writes:—"A very valuable food .... a very powerful and agreeable tonic and stimulant."

THE HOSPITAL:—"Its most valuable feature is that clinically it has proved itself capable of absorption when everything else has been rejected by the stomach."

THE BRITISH MEDICAL JOURNAL:—"Readily taken and well borne, even by a very delicate stomach."

DOSE.—One or two tablespoonfuls four to six times a day.

A paper on colonic alimentation, giving the latest methods and formulæ, will be forwarded on application to the Company. To ensure a correct supply to patients, Physicians are respectfully requested to specify this preparation in writing.

CARNRICK'S "SOLUBLE FOOD" FOR INFANTS AND INVALIDS.

A Pancreatised Milk-Wheat Food.

A notable feature is the soluble condition of the casein, preventing co[illegible] curdling of the food in the infant's stomach.

When made up according to directions it approximates very clo[illegible]sely to human milk in composition and physiological properties.

It is also a valuable auxiliary food for invalids and convalescents.

Issued in 4 oz., 8 oz., and 16 oz. soldered tins.

CARNRICK & CO., Limited, 183, Acton Vale, London, W.[illegible]3.,

Will be pleased to send Samples Free of Charge to Medical Men.

"MALTINE"

"MALTINE" contains 75 per cent. of diffusible Cereal Proteids, Carbohydrates, and Organic Phosphates. It is pure, concentrated, standardised in diastase (1000), of convenient semi-liquid consistence, and very palatable.

Professor CHITTENDEN (Yale University) reports:—

"The results demonstrate conclusively the far greater diastasic value of your preparation, and enable me to state, without any qualification whatever, that 'MALTINE' far exceeds in diastasic power any of the preparations of malt which I have examined."

THE LANCET says:—

"'MALTINE' exhibits in an eminent degree the starch-dissolving power of diastase; in fact, a teaspoonful is capable of converting instantaneously a surprising amount of stiff starch paste into a thin limpid liquid."

COMPOUNDS of "MALTINE."

"MALTINE" with Cod Liver Oil
"MALTINE" with Iron
"MALTINE" with Hypophosphites
"MALTINE" with Creosote
"MALTINE" with Pepsin and Pancreatin
"MALTINE" with Phosphates
"MALTINE" with Cascara Sagrada
"MALTO-YERBINE."
"MALTINE" with Phos. Iron, Quin., & Strych.

The "MALTINE" Formula for Humanising Cow's Milk

The "MALTINE" Formula, introduced in 1907, based on experimental work by our chief chemist, is simple and logical, and has been tested and confirmed in practice by the highest Medical Authorities.

By the addition of "MALTINE" Plain to the milk, coarse curdling is prevented by the diastase, and the milk is sweetened by the maltose, and closely approximates to human milk in composition and physiological properties.

Full particulars, together with complete Feeding Tables, giving the proportions of milk and water for different ages and periods of feeding, may be obtained on application to the Company.

The word "MALTINE" is our Trade Mark. In prescribing, kindly specify "MALTINE COMPANY."

THE MALTINE MANUFACTURING CO., Ltd., 183, Acton Vale, London, W. 3.,
Will be pleased to send Samples Free of Charge to Medical Men.

An aromatic extract of the gastric juice.

Possesses high digestive power.

Palatable, and stimulates digestion.

Prescribed alone, diluted, or in combination with acids and tonics, and as a vehicle.

In all cases where PEPSIN is desirable.

Pepsencia.
Pepsencia.
Pepsencia.

DOSE: For Adults, one teaspoonful
For Infants, from 5 to 15 drops.

'WELLCOME'

BRAND

Typhoid Vaccines

'WELLCOME' Brand Typhoid Vaccine

Issued in three strengths:—500 million, 1000 million and 2000 million organisms per c.c.

DOSAGE.—1st. dose, 500 million; 2nd. dose, seven to ten days later, 1000 million; 3rd. dose, if advisable, 2000 million.

'WELLCOME' Brand Typhoid Vaccines, Mixed

No. 1*a*—containing 500 million *B. typhosus* and 375 million each of *B. paratyphosus* A and B in each c.c.

No. 1*b*—Double the strength of No. 1*a*.

No. 2*a*—containing 500 million *B. typhosus*, 375 million each of *B. paratyphosus* A and B, and 5000 million (=2 mgm.) *V. choleræ* in each c.c.

No. 2*b*—Double the strength of No. 2*a*.

DOSAGE.—Two doses: 1 c.c. of 1*a* or 2*a* and, seven to ten days later, 1 c.c. of 1*b* or 2*b*.

Each of the above Vaccines are issued in hermetically-sealed phials of 1 c.c. at 2/6 each, and in rubber-capped bottles of 25 c.c. at 25/0 each.

"Wellcome" Brand Sera, Vaccines and Tuberculins are prepared at the Wellcome Physiological Research Laboratories, London.

Archers and swordsmen of the escort accompanying the Korean envoy to Japan. Although the short Tartar bow of horn and sinew continued in use in Korea until very recent times, the weapon here carried appears to be the Japanese bow of bamboo and oak. Behind the warriors come porters carrying chests containing the treaty documents, or perhaps some of the less heavy material offered as tribute. Date, A.D. 1711.

IN THE TREATMENT OF

ANÆMIA, NEURASTHENIA, BRONCHITIS, INFLUENZA, PULMONARY TUBERCULOSIS, AND WASTING DISEASES OF CHILDHOOD, AND DURING CONVALESCENCE FROM EXHAUSTING DISEASES,

THE PHYSICIAN OF MANY YEARS' EXPERIENCE

KNOWS THAT, TO OBTAIN IMMEDIATE RESULTS, THERE IS NO REMEDY THAT POSSESSES THE POWER TO ALTER DISORDERED FUNCTIONS, LIKE

"Fellows' Syrup of Hypophosphites."

MANY A TEXT-BOOK ON RESPIRATORY DISEASES SPECIFICALLY MENTIONS THIS PREPARATION AS BEING OF STERLING WORTH.

TRY IT, AND PROVE THESE FACTS.

SPECIAL NOTE.—Fellows' Syrup is never sold in bulk, but is dispensed in Bottles containing 8 oz. and 15 oz.

This Preparation may be obtained of all Chemists & Pharmacists throughout the United Kingdom.

NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who examined samples of several of these, FOUND THAT NO TWO OF THEM WERE IDENTICAL, and that all of them differed from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, IN THE PROPERTY OF RETAINING THE STRYCHNINE IN SOLUTION, and in the medicinal effects.

An Address
ON
CONCUSSION INJURIES OF THE VISUAL APPARATUS IN WARFARE. OF CENTRAL ORIGIN.

*Delivered at the Annual Congress of the Ophthalmological Society of the United Kingdom, May 5th, 1917,**

By S. A. KINNIER WILSON, M.D., B.Sc. EDIN., F.R.C.P. LOND.,

ASSISTANT PHYSICIAN, WESTMINSTER AND NATIONAL HOSPITALS; NEUROLOGIST, FULHAM AND NAPSBURY MILITARY HOSPITALS; PHYSICIAN, LORD KNUTSFORD'S SPECIAL HOSPITALS FOR OFFICERS, ETC.

MR. PRESIDENT AND GENTLEMEN,—It is imperative at the outset to indicate as precisely as possible what type of case is to be assigned to the above category, for the whole subject of concussion and commotio is still surrounded with considerable obscurity, and looseness of conception is responsible for a certain amount of clinical confusion.

CEREBRAL CONCUSSION AND COMMOTIO.

The difficulty is not lessened by the fact that the usual definitions of concussion and commotio do not command universal consent. Cerebral concussion is commonly understood to signify a violent shaking or jarring of the cranial contents without any structural lesions, and it seems certain that in some cases which have proved fatal the most painstaking investigation has failed to reveal any recognisable anatomical lesion. Yet the idea of a *morbus sine materie* is so repelling that to explain such cases a condition of "shock" is postulated, i.e., a reflex inhibition of certain cerebral mechanisms essential to life, or a condition of commotio, i.e., molecular concussion, producing the same result. Not a few writers, however—Kocher,[1] Page,[2] Thorburn,[3] Stolper,[4] Schmaus,[5] Hartmann,[6] and others—deny the reality of spinal or cerebral molecular concussion (commotio), maintaining on the contrary the impossibility of a severe or fatal cerebral or spinal affection without any definite anatomical lesion.

In most cases of severe blows on the head, as a fact, which have been diagnosed as concussion and which have proved fatal, examination has shown the presence of capillary hæmorrhages, minute lacerations of cerebral substance, and consequent disintegration of myelin, such as are sufficient to account for the clinical symptoms. Further, as Warrington[7] has remarked, and as any who have considered the subject must have realised, there is, with the blow, a sudden violent dispersion of cerebro-spinal fluid, which tends to escape too abruptly by the natural exits. Hence ensues a tearing of lymph channels and injury to the adjacent cerebral tissues.

In non-fatal cases, where the symptoms, though definite enough, have eventually cleared up completely, it is justifiable to assume organic lesions such as have been enumerated, which have not, however, been sufficiently widespread or serious to effect permanent impairment of cerebral function. For such cerebral conditions, where one has reason to suppose recognisable, if temporary, organic changes have occurred, it is preferable to employ the term cerebral contusion.

For the purposes of this paper, then, cerebral contusion may be taken to be the pathological basis of the condition known clinically as cerebral concussion.

Now, it does not appear practicable to draw a hard-and-fast line between such cases and those, slighter in degree, to which the term commotio—i.e., molecular concussion—may be applied. A knock on the "funny bone" produces a transient disturbance of sensibility in the ulnar distribution, as a basis for which we may perhaps postulate transient oscillations in the axoplasm of the nerve fibrils; whatever it be, we must imagine some change taking place. When the pressure of one limb on the popliteal nerves of the other results in the foot's becoming "asleep," we suppose a disturbance of function whose basis may be interruption of periaxonal or perineuronal lymph circulation. Let the pressure continue longer, as in, say, a crutch palsy, and we have an actual organic impairment of function which may take weeks to clear up. We call such a condition, *faute de mieux*, a pressure-"neuritis"; but the accuracy of the term, pathologically speaking, is problematical; indeed, whether any recognisable change could be determined microscopically is questionable. It is impossible to say in such a series of instances at what precise stage the term "structural change" may be fairly adopted, and the difficulty is not less in regard to cerebral commotio. Oppenheim,[8] in opposition to the other authorities quoted above, is unwilling to relinquish the conception of molecular concussion or commotio, although he rather admits that for him the conception does not exclude the possibility of such fine organic changes as alteration in capillary or lymph-channel walls, disintegration of the myelin in individual fibres, and so on. From the nature of the case, in the present state of knowledge the matter must remain in the realm of hypothesis.

While, then, the question of the actuality or otherwise of molecular concussion or commotio is still *sub judice*, and to some may be of mere academic interest, it should not be overlooked that from the clinical side it presents features of importance. In the course of the war there have come under my notice a large number of concussion lesions of the spinal cord of every kind, which may range from complete pulping of the cord at a given level, with dura mater intact and untouched, to a concussion such as reveals itself solely by transient symptoms of the type unfortunately termed "functional." Clinically there is, at the one extreme, a total motor and sensory paraplegia; at the other, the tremulous weakness, paræsthesiæ, and exaggerated reflectivity of "functional" disease. For practical purposes it is convenient and serviceable to divide cases into organic and "functional," but more than one case has come under my notice that has clearly been a sort of "missing link" between the two groups.† The evidence undoubtedly suggests that in certain cases so-called "functional" symptoms following immediately on spinal concussion are but the expression of an organic alteration minimal in degree and insufficient to result in the appearance of organic symptoms as ordinarily known. The significance of this will be seen subsequently in regard to the visual apparatus.

EVIDENCE AFFORDED BY EXPERIMENTAL WORK.

Experimental work on the subject of concussion and commotio has been attempted to some extent, but it does not help to clarify our ideas as much as might have been expected. Schmaus[5] has demonstrated, in artificial concussion of the cord in kittens, swelling and degeneration of axones and fragmentation of myelin, without any gross pathological lesion. It has been shown that a blow upon the head of an animal may occasion this myelinic change in the fibres of the medulla, and even of the cord, presumably by dispersion of the cerebro-spinal fluid. Much the best and most scientific experimentation has been conducted by Alan Newton,[10] in the laboratory of the late Sir Victor Horsley. Newton allowed a glass rod, 8 mm. in diameter and weighing 50 gm., to fall upon the exposed spinal cord from varying heights, accuracy of direction being obtained by means of a glass tube, 1 cm. in diameter, through which the weight fell. So marked was the effect from heights of 40, 20, or 10 cm. that the height was reduced to 2 and finally to only 1 cm. The latter was a feeble blow, producing no visible effect on the cord, yet it completely abolished motor conduction for several days, both in the cat and the monkey. It is important, further, to note that a dissociation in conductivity was obtained, sensory conduction being still demonstrable, though motor inhibition was complete. The anatomical changes found in such animals were described by Newton as "trivial"; "they consisted of small hæmorrhages in the grey matter, usually in the basal region of the posterior cornua or in the posterior grey commissure, scattered swellings of axis-cylinders, and disintegration of myelin sheaths."

These experiments suggest that there is an organic basis for the transient disturbances of function seen in so-called "railway spine" and allied conditions of traumatic neurasthenia, and they bear out what has already been remarked, that "functional" symptoms may be the expression of minimal organic changes. They also prove the occurrence of a relatively surprising amount of tissue change from a feeble impact on the exposed cord, and show that the blow capable of producing merely a molecular concussion must be slight.

* THE LANCET, 1917, i., 814.

† In this connexion some cases reported by Elliott[9] are of interest

RARITY OF CASES OF PURE VISUAL CONCUSSION IN WARFARE.

When, from these necessary preliminary considerations, we pass to the question of concussion injuries of the visual apparatus in warfare, of central origin, we are compelled to the conclusion that a molecular concussion, or commotio, is almost certain to be of great rarity, for the simple reason that the impacts of high velocity projectiles, or even of shell fragments or spent bullets, are tremendous, to a degree far beyond that of the glass rod utilised in Newton's experiments. The shooting editor of the *Field* has written a letter on the subject, which is quoted by Musson [11] in his recent paper on the finer histological changes in the spinal cord following bullet wounds of the cord substance or shock to the vertebral column, and which contains useful information on the topic under discussion. It relates to the ·303 Mark VII. service bullet, weighing 174 grains.

Assuming that such a bullet strikes the body at 200 yards with 1000 foot-pounds energy, and is pulled up in 3 inches by the skin, muscles, and spinal column, the resistance offered by the tissues is on the average ..... 4000 lb. This 4000 lb., being the resistance offered by the tissues, may be regarded as the static pressure of the bullet acting against the tissues.

That an impact so tremendous should render the occurrence of a mere commotio practically an impossibility is not in any way surprising. And even though a bullet be spent or a shell fragment be pulled up by a steel helmet, the force of the blow must still be much beyond that which has often produced a concussion or commotio in civilian cases.

It will be seen, therefore, at once that while gross contusion lesions of the central visual apparatus are common enough, one may have to seek far and wide ere one can find a case which for the purposes of this communication may be admitted into the category of visual concussion, where, one may suppose, the organic disturbances are of the trivial nature that has already been described.

At Fulham Military Hospital and Napsbury War Hospital a large number of head injuries of all sorts have been referred to me; at the National Hospital and at Lord Knutsford's Special Hospitals for Officers, in addition to my own cases, I have had the opportunity, through the kindness of my colleagues, of going over a very considerable number of head cases with visual symptoms, and it may be said at once that only one case, described below, approaches the conception of an uncomplicated visual concussion, and even it is by no means free from objections. Two other cases to be quoted are instances of visual symptoms following blows on the head, but the mechanism of production of these symptoms is not that of concussion, and they are cited by way of contrast. After two and a half years one is still looking for a case where a direct blow on the head from any form of projectile, without gross wounding, has resulted in an uncomplicated visual commotio analogous to the cases of spinal-cord or peripheral-nerve commotio that have been, relatively speaking, common.

CASES EXCLUDED FROM CONSIDERATION.

Let it be observed that all cases of visual disturbances from shell explosions *in the vicinity of* the individual concerned are purposely excluded. They belong to another group. Such are common and well known (see, for instance, Myers's [12] cases). I am not concerned to deny that violent dispersion of the air is a physical factor which may produce physical, i.e., organic, injury; on the contrary, two genuine cases of organic lesion of the spinal cord from shell explosions, without any outward mark, have come under my notice, and others (e.g., Ravaut [13]) have described similar examples. As long ago as the battle of Trafalgar, as Mahan tells, Nelson's clerk was "killed by the wind of a ball, though his person was untouched." Still more may such dispersion occasion transient disturbances of the kind we call "functional," though they may have some subtle organic basis underlying them. But obviously other factors, of a different class from those leading to commotio, come into play in such cases—"shell shock" is a complex resulting from several agencies. Further, it is difficult to imagine how visual impairment from "shell shock" could be of central origin, unless, of course, the patient, knocked over by a shell explosion, were to strike his head in falling. The peripheral visual apparatus is exposed, whereas the central apparatus is protected by the cranial box; it is the peripheral mechanism that must take the brunt of such "windage" effects. A consideration of the frequently accompanying phenomena of photophobia, blepharospasm, of "eyes burning," and so on, bears this out. To attempt to demonstrate the possibility of central defects by the action of diaschisis from peripheral concussion would be impracticable. Unless an exact history of a fall on the head from a shell explosion were forthcoming, the occurrence of central concussion from "shell shock" can scarcely be established. Personally, no such case has come under my observation, out of a very large number of cases of "shell shock."

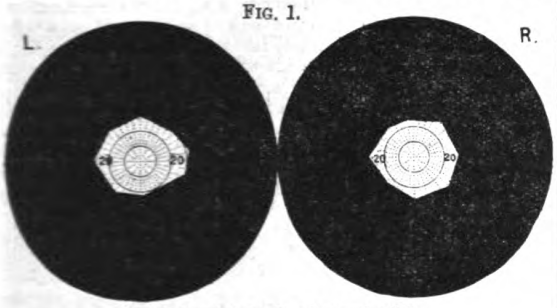
Secondly, all cases of head wounds with resulting more or less permanent organic visual defects are excluded. Many cases of ordinary head injuries in the occipital region, with resulting scotomata and hemianopias of various kinds, have come under notice. Only a relatively gross organic defect in the form of loss of cortical substance, cortical or subcortical hæmorrhage, &c., will explain the condition, clinically, so that they do not belong to the concussion group. It is a matter of common observation that in the majority of such cases a period of practically complete blindness is the initial phase, much of which subsequently clears up. In Marie and Chatelin's recent paper,[14] for instance, it is noted, in passing, that most of their patients with varieties of hemianopic defect were blind for so many hours or days at the outset. Where, however, we have actual gross injury to the skull and intracranial contents, it is impossible to determine whether cortical laceration, or œdema, or subdural or subarachnoid effusion, or capillary oozing, or other obvious organic change, or merely a concussion or commotio, is the underlying factor for such symptoms as clear up completely. For this reason, if for no other, one cannot take severe head injuries into the class which forms the subject of this communication.

CASE OF VISUAL CEREBRAL CONCUSSION OR COMMOTIO.

We are left, then, with cases where a blow on the head produces visual symptoms that tend to clear up, but does not result in a permanent hemianopia in any of its varieties or other type of organic symptom. Though the case about to be quoted admittedly does not come up to the proposed criterion it is the one least open to objection.

CASE 1.—Private A. B., aged 19, with a negative previous and family history, was wounded at 4 P.M. on Dec. 14th, 1916. At the time he was stooping down, cutting wood, in a little dug-out. He was hit on the back of the head, in the mid-line, just below the margin of his steel helmet, by a fragment of a shell and lost consciousness for, at the most, three minutes. He came to, to find a mate moving his right arm, which had also been hit and which was very painful; it was, perhaps, this pain which reached his sensorium and brought him round. At the same time he had racking pains all over the head, was very sick, and found he was completely blind in both eyes. He kept asking whether his eyes had been hit, as he could see nothing at all, only blackness everywhere. He remained thus blind for between 40 and 48 hours. On the third day he found that he was beginning to see dimly with both eyes, and trying each separately he found he could see a little with each. He saw a hand holding a medicine-glass, but nothing beyond that; such objects appeared very near him, but not altered in size—there was, in other words, no dysmetropsia with this defect in the appreciation of distance. The same afternoon he was operated on, and a small piece of loose fractured bone removed from the head wound; again, two days later, a second small splinter was taken out.

Towards the end of the first week, when his sight was improving, he frequently noticed a succession of faint, dark, shadowy forms and figures moving to and fro in front of his eyes, apparently. He never could make out quite what they were, except that they were always shadowy and dark with no colour in them. Sometimes they were still. He used to shut his eyes to get rid of them, but this procedure did not banish them, or, rather, sometimes it did and sometimes it did not. These subjective visual phenomena disappeared after about a fortnight. Of them the patient remarked that they always appeared smaller than reality, whereas objects seen in front of him were of normal size. Only the hallucinations were micropsic. It should be stated that at no time were the patient's eyes bandaged, nor was there at any time either photophobia or blepharospasm.



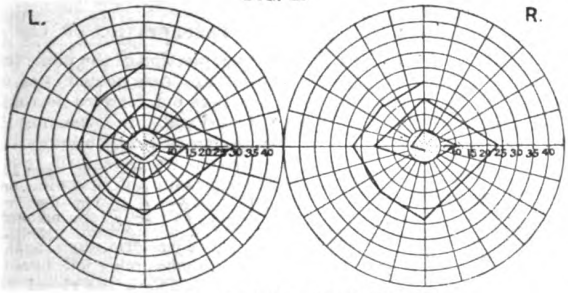
Very slow improvement took place, and when the patient came under my observation two months later his condition was as follows. The pupillary reactions were normal. The optic discs were normal with no indication of previous neuritis. There was no trace of any form of hemianopia or of scotoma, central or otherwise. Vision was R. 6/60, L. 6/60; Jaeger 14 R. and L. There was no headache, giddiness, or sickness. Careful routine examination of the nervous system revealed no abnormality except in regard to the visual fields. Here there was a concentric diminution of both fields, not quite symmetrical, both for white and colours, and also a marked condition of visual fatigue, so that excellent examples of a helicoid curve were obtained, in both eyes. This helicoid was present both for white and colours, and was rather flattened in a vertical direction. Bjerrum's screen was always used in testing.

The patient was re-examined at intervals during the next two months, the improvement continuing slowly. On May 4th his vision was R. 6/20, L. 6/15; Jaeger, R. 6, L. 4. The fields were distinctly better than before in the sense of being less constricted; the helicoids were again obtained. (Figs. 1, 2, and 3.)

The patient is still under observation.

As the X ray photograph shows, and the fact of operation indicates, we are dealing in this case with a lesion of undoubted severity, the outer table being splintered and the inner being cracked, and perhaps slightly splintered too. It is not to be denied that with such a lesion submeningeal effusion, or intracortical capillary hæmorrhage, or tearing of

FIG. 1.



Fields for white in Case 1 (April, 1917).

lymph channels, or myelin fragmentation, are clearly possibilities to be envisaged. But, on the other hand, it must be borne in mind that the patient was unconscious for at the most three minutes, that there has been no evidence of intracranial pressure, that the absence of any form of scotoma or hemianopia is proof of the general integrity of the visual cortex, and that the visuo-psychic areas are similarly intact.

If, therefore, in the ordinary sense, there is structural integrity of the visual cortex, we are justified in associating the visual phenomena with the fact of a violent concussion over the occipital poles.

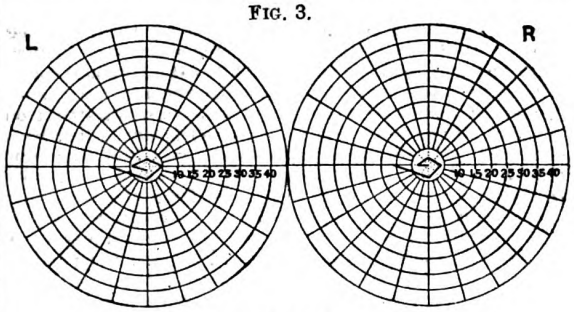
It is not forgotten that when bullets are directed against water-containing mediums, as the shooting editor of the *Field* states, they set up a hydraulic force which acts radially through the mass. The brain, however, does not respond exactly as a water-containing medium, and the reaction to a blow is not uniformly distributed throughout its mass. As Warrington says, it is most intense at the point of application and in those parts of the brain opposed to fixed points—the points of *contre-coup*. Now, in the case under consideration there is no clinical evidence to suggest a condition of *contre-coup*; hence the conclusion above stated appears to me inevitable.

FIG. 2.

Spiral fields for white in Case 1 (May 4th).

REASONS FOR NOT REGARDING THE CASE AS TRAUMATIC HYSTERIA.

An objection of another kind must next be considered. It may be said this is merely a banal case of traumatic hysteria, as helicoid and concentric diminution of the visual fields were described long ago in that neurosis and have been supposed to be pathognomonic of it. (By the way, it may be worth remarking that the existence of helicoid fields in hysteria is one of those typical statements which are copied from one text-book to another in uncritical fashion and which may be found to have little satisfactory clinical support. None of the more modern works on hysteria contain any fresh clinical instance of the condition, while some authorities do not even refer to it. It is, in short, a matter which calls for re-investigation.) But against this contention several arguments may be raised.



1. With the exception of the visual symptoms no impairment of function of the nervous system was discovered. Were the case, then, one of hysteria, it must fall into the category of monosymptomatic cases, which in ordinary experience are rare, but do nevertheless occur. Now concentric diminution of the visual fields has never been described as an isolated phenomenon in hysteria. Personally, I have never seen an instance of this visual defect in hysteria unaccompanied by cutaneous anæsthesia. This is in agreement with the findings of Voss[15] in his monograph, and Féré,[16] Wilbrand and Saenger,[17] and others have also stated that concentric diminution of the fields is found only in cases with some form of anæsthesia elsewhere. In face of this opinion the contention that the case is hysterical is seriously weakened.

2. The war has afforded proof, over and over again, of the fact that an interval of hours or days intervenes between the shock-producing stimulus and the development of a traumatic psychoneurosis such as hysteria. The French say "there is no hysteria in the firing line"; time must elapse, though it be measured but by hours, for subconscious complexes to be formed—"une période de méditation" is necessary, a subconscious rumination. Instance after instance of the action of this mechanism has come under my notice; it is, in fact, almost a commonplace. Now in the case under consideration the patient was struck on the back of the head, was unconscious for three minutes, and regained consciousness to find himself completely blind. In 48 hours he was beginning to improve. Being ignorant of the details of cerebral anatomy, he thought his eyes had been hit. In view of these circumstances it is maintained that to attribute his symptoms to post-traumatic auto-suggestion or other subconscious activity is unjustifiable and erroneous. The condition is physiopathic and not psychopathic.

That traumatic neurasthenic symptoms may immediately succeed a shell explosion or a direct injury, such as being buried, is recognised by all who have been working on the neurological side of the injuries of warfare, but a distinction must be drawn between neurasthenic manifestations and hysterical manifestations. Restriction of the visual fields and helicoid curves, without being in the strict sense pathognomonic, are characteristic of the latter condition. Instead, therefore, of regarding the case as one of traumatic hysteria of the monosymptomatic variety I hold that we are dealing with a true cerebral concussion, or commotio, affecting the visual system, and some at least of its value consists in the light which it throws on the mechanism of production of so-called "functional" phenomena. That is to say, so far from hysteria mimicking organic disease in this case—a process which Charcot and his pupils maintained was of common occurrence—we have here an instance of organic disease—for a concussion is an organic state—mimicking hysteria, where the symptoms produced by a violent blow, without, presumably, any gross structural change, simulate, though they are not identical with, those produced by subconscious activity.

A generation ago Hughlings Jackson asked what are the symptoms of "functional" disease of the cerebellum, and the question remains unanswered. Of the "functional" diseases of other intracranial mechanisms we are equally

FIG. 3.

Spiral fields for red in Case 1 (May 4th).

ignorant. It may be that to put the matter in this light will evoke the response that all symptoms are "disturbances of function," and that to try to distinguish between "functional disturbances" and "disturbances of function" is a mere quibble. So much the better. I believe this case may

be taken to suggest that in certain cases the outward manifestations of a minimal organic disturbance are of the type hitherto supposed to be characteristic of "functional" disease. It becomes matter for discussion whether the "shock" of a concussion may not effect a change in cortical bio-chemical activity the expression of which is comparable to the "functional" disturbance called hysteria.

CASE OF TRAUMATIC HYSTERIA.

By way of contrast, a case may be selected where, notwithstanding head injury and cerebral concussion amounting perhaps to contusion, the visual symptoms are, in my opinion, derived from another source.

CASE 2.—Sapper C. D., aged 44, was wounded at Neuve Chapelle in March, 1915. When walking down a path from the village to the trenches he was struck by fragments from a shell which exploded in his immediate vicinity, and fell unconscious. He does not remember anything till his arrival in hospital, two days later, and it is not known whether he remained unconscious all that time. He was wounded in the forehead above the right eye, the frontal bone being splintered, and above the right ear, where, apparently, the bone remained intact; there was a cut on the left upper eyelid and dirt in the left eye. When he came to he found the left eye bandaged, while the right was free. The bandage remained on for some ten days, and when it was permanently taken off he discovered that he could not see with the left eye, while the right was normal. With the left eye everything was "a blur of golden light," "like a sun with its rays pointing out in all directions," so that he could distinguish nothing. The visual condition remained unchanged till six months ago, when he noticed he could see out of a small area in the upper and outer field on the left side. This has not apparently enlarged during these six months.

On examination in March, 1917, the actual condition of the left eye was seen to be normal in all respects. The pupil reactions were normal on the two sides. The optic discs were normal and identical in colour. The double prism and "friend" tests unfortunately both proved unsatisfactory, mainly because they had been tried before and because the patient's answers were non-committal and obviously not frank. However, he was found on further examination to be "deaf" in the left ear and anæsthetic to pinprick over the left half of the body and limbs, including the left half of the tongue. (It should be added that two sisters of this patient's mother were at one time in an asylum, and both died there.)

In this case, conceivably, we are dealing with a concussion effect on the left peripheral ocular mechanism, but in view of the other symptoms it is to be placed in the category of traumatic hysteria. Notwithstanding the genuine cerebral concussion produced by the head injuries the mechanism of development of the blindness is of a different kind altogether from that of the first case.

CASE OF SO-CALLED "SUBCONSCIOUS MALINGERING."

Another case may be selected.

CASE 3.—Private H. F., aged 45, was sniping from the trenches at Zonnebeke one evening in September, 1915, when he was hit on the left side of the head and face by fragments of what he maintains was an explosive bullet, which struck some object only a few inches away from where he was standing. He fell unconscious, and remained in that state for about one hour. On coming round he discovered he was blind in both eyes, and remembers that he noted this at a time when the bandages which covered both eyes were temporarily removed. On about the tenth day after the wound the bandage was permanently taken off the right eye, and he found vision with that eye was normal again. The left eye remained covered with a shade for some more weeks, and when it too was removed he declared he was quite blind in the left eye still, and he has remained so ever since.

On examination in March, 1917, the left eye was seen to be normal in all respects, with normal pupil reactions. The optic disc was normal and identical in appearance with the right. No defect of any kind was discovered in the nervous system, either organic or "functional." With the double prism and the "friend" tests the patient was completely caught out, and the nature of his visual condition at once demonstrated.

Here, again, in spite of the general cerebral concussion, unconsciousness, and immediate blindness, the persisting visual defect is clearly seen to be of the nature of so-called "subconscious malingering." Whether the blindness noted at the outset was a concussion phenomenon is questionable, in view of the facts that the patient was not struck on the back of the head, and also that he knew he had been hit in the face and round the left eye, was told there was dirt and sand in both eyes, and remained with both bandaged for some ten days. To exclude the possibility of a peripheral concussion would be more difficult, and it is conceivable we have here a hysterical symptom erected on an existing slight organic basis. The case is quoted to illustrate this difficulty in determining whether a persisting symptom is an original symptom, as well as the further difficulty of assigning relative importance to the more or less synchronous actions of more than one etiological factor.

EFFECTS OF CEREBRAL CONCUSSION.

Some considerations arising out of the subject deserve a little attention.

It may be taken as axiomatic that every case of head injury from gunshot wounds of any kind in warfare must be associated with cerebral concussion, whether it be a cerebral contusion or something considerably less in degree. The immediate effects of concussion are generalised, in the shape of, *inter alia*, unconsciousness. The sequelæ may be localised or generalised, or both. Among the latter are headache, asthenia of cerebral type, not infrequently "cerebral irritation" as revealed by profound restlessness, inattention, and irritability.

More interesting for our purpose are localised sequelæ. Some special function of the brain may be permanently lost or impaired—e.g., a localised retrograde amnesia has not seldom been observed. Moutier[18] has recently published a record of his investigations of labyrinthine impairment of function after cerebral concussion from head injuries in warfare. In a series of 46 cases of gunshot wounds of the head no fewer than 40, i.e. 87 per cent., showed evidence of labyrinthine concussion or defect of function on objective examination, independently of the site of the injury. That so high a proportion is reached can be understood from the situation of the labyrinth, embedded in the bony framework of the cranial box.

This raises the question of the relative vulnerability to concussion of the special sense systems of the cerebrum. I have no data for taste and smell, but as far as the others are concerned, in my experience visual impairment after generalised cerebral concussion is much rarer than labyrinthine impairment, and certainly rarer than auditory impairment. It is interesting to note in this connexion that Mott[19] finds in his experience of "shell shock" cases that defects of vision are relatively uncommon as compared with deafness and hyperacusis. Probably the anatomical situation of the central visual apparatus acts as a protection, while for the same reason as the labyrinth the peripheral auditory mechanism is prone to be concussed wherever the actual head injury be.

INTERPRETATION OF VISUAL PHENOMENA IN CASE 1.

The question of the interpretation of the visual phenomena in the first case quoted is of considerable importance. The view here put forward is that symptoms usually held to be "functional" in type may be the expression of a direct visual concussion, undoubtedly an organic condition. These symptoms are concentric restriction of the visual fields and the occurrence of helicoid or spiral fields with certain tests.

1. In regard to the first of these, it must be borne in mind that such concentric diminution, supposed to be characteristic of hysteria, does certainly occur from head injuries. In the series recorded by Marie and Chatelin[14] there are two cases where the visual fields are almost identical with those obtained at the first examination in my case. In these two, however, "il s'agissait de traumatisme grave de la région occipitale atteignant les deux sphères visuelles." In many other cases, as has been already remarked, an occipital head injury is ushered in by general blindness for some days or hours: "Le syndrome de la cécité corticale relevait chèz ces blessés de commotion ou de compression de tout le territoire visuel cortical, non de destruction étendue comme dans les deux cas." Marie and Chatelin therefore regard the general blindness as due to compression or commotio, whereas by implication the constricted fields of their two cases have a different origin. In each case the patient was blind for many months, and macular vision was the first to return. Whatever be the explanation—and the authors do not venture on one—the important point is that such fields are clinically indistinguishable, as far as constriction is concerned, from those of hysteria. There is no mention of subconscious vision over the rest of the field, and it may confidently be assumed that the two patients showed none of the usual phenomena of hysteria.

Again, in the series published by Lister and Holmes[20] there is one (their Case 20) where the patient was shot through the head from side to side, above and behind the pinnæ. "Six weeks after the infliction of the wound he could only read large letters, and his visual fields were limited to a zone of about 10° around the fixation point. He was able to recognise colours by macular vision." There is no mention or suggestion of hysterical symptoms, and, of course, the organic nature of the lesion is undoubted, it being fairly certain that the optic radiations were injured. The authors state that in their opinion "the interpretation of his visual disturbance is doubtful." Here, once more, is an organic case with a visual defect of constricted fields, as in hysteria.

My case is a fourth, therefore, where a moderately severe organic lesion in the occipital region is followed first by general blindness, and subsequently by concentric diminution of the fields, in a marked degree; and, like these others, with no trace whatever of any symptom of the hysterical psychoneurosis. It differs from Marie and Chatelin's cases in the short duration of the blindness; in fact, it is a very much milder case as far as general symptoms are concerned. Lister and Holmes say that "telescopic vision" is "not uncommon in patients who have been shot through the head in the lower parietal or temporal regions," and the above case is quoted by way of illustration. They do not, however, make any suggestion as to the pathogenesis of the condition in these cases.

By way of contrast, in regard to this one point, a case recorded by Eisdell Moore[21] may be quoted. The patient was shot through the back of the head from side to side, and was at once totally blind. On the seventh day he could distinguish "large objects"; on the tenth he could count fingers (distance not specified); on the fifteenth "there was some limitation of the right field of vision." Within three weeks his fields of vision were "normal." Unfortunately, perimetric examination was not practicable. The author's comment is: "From the rapidity of recovery it is evident that blindness was due mainly to concussion, yet it seems extraordinary that a bullet could pass through both occipital lobes without causing some permanent interference with vision." It is possible, however, that a bullet might pass through the occipital lobes without injuring either the optic radiations or the area striata. Notwithstanding the incomplete record this is a case of direct occipital jarring without notably constricted fields, and without doubt most workers on the subject have seen analogous cases.

From what has been said, then, it must be conceded that in certain cases of organic injury of the central visual mechanism, by concussion or otherwise, the result is constriction of both fields, occurring by itself and without evidence of subconscious vision in the remainder.

2. I have not been able to find any reference to helicoid fields in recent war literature with the exception of a comment by the late Mr. Jessop[22] at the discussion on Shell Shock without Visible Signs of Injury at the Royal Society of Medicine. Jessop there stated he had had under his care numerous cases of temporary blindness following the explosion of shells. "The blindness lasted under a week, and generally about two or three days. Both eyes were always affected, the pupils were active to light, and the ophthalmoscopic appearances normal. The fields of vision were sometimes contracted, but more often normal: in only two cases did I find a spiral field." It is to be regretted that more details were not recorded, especially as it is not clear exactly what explanation Jessop gave of their occurrence. He said that "the windage of the shell, or in some cases *the actual blows from falling down or violence* (italics mine) affected the cortex cerebri." If this were so in the two cases specified, then undoubtedly they had for basis an organic condition, presumably a cerebral concussion or commotio (the discussion dealt solely with cases without visible injury). In the absence of further information it is idle to speculate, but the assumption is perhaps justifiable that Jessop inclined to a view of their development which was not the ordinary theory of traumatic hysteria.

The difficulty that surrounds the subject will be obvious to the reader. Under what circumstances certain side-to-side injuries of the back of the head produce constricted fields is not known‡; why my Case 1 shows the condition in typical guise, while other occipital lesions that have come under my observation, by no means dissimilar in extent or site, are not followed by such clinical symptoms, is far from clear. For the present, it appears a reasonable contention that in certain cases without permanent visual defect of the accepted organic type of hemianopia or scotoma constriction of the fields, and helicoid or spiral fields, may be the expression of an organic change, the basis of which is a violent commotio, or a concussion amounting to contusion, of the visual cortex or some part or parts of it not more closely to be specified, or of the subcortical visual projection system.

‡ Sir William Gowers held there was clinical evidence to suggest that lesions in the neighbourhood of the angular gyrus might produce amblyopia and some restriction of both visual fields, more marked in the contralateral eye, but his views have not received much support.

ASSISTANT, BACTERIOLOGICAL DEPARTMENT, MEDICAL RESEARCH COMMITTEE.

(*From the Inoculation Department, St. Mary's Hospital.*)

IT has long been recognised that after the first phase of acute bacterial infection has been satisfactorily passed, the treatment of wounds should be directed to the rapid closing of any cavity and the covering of the surface with epithelium, rather than to the killing of the bacterial flora which was the original cause of the suppuration. As illustrating the futility of attempting to keep an open wound sterile, Wright, in a recent lecture, instanced the case of burns, which, although usually at first sterile, invariably become infected later and are notoriously prone to troublesome sepsis. The importance of obtaining the rapid healing of wounds might be urged on many other grounds, some of which are so apparent as scarcely to call for mention, such as the reduction of the period of invalidism, the prevention of contractures, and the rapid restoration of function.

It will be generally agreed that the ideal procedure for this purpose is along the lines of plastic surgery; for instance, by the operation of secondary suture, or the more conservative method of drawing the edges together with adhesive plaster—the "dry suture" of the eighteenth-century surgeons.

Healing Process of Wounds: Neglect of Skin Grafts.

Most suppurating flesh wounds when treated effectively from the beginning pass after a period of one to three weeks of acute sepsis into a clean, "raw meat" stage, in which the tissues are found to be loose and supple, the surface covered with a thin layer of healthy granulations, and the bacterial flora remarkably sparse. At this stage secondary suture has, in many surgeons' hands, proved a most successful operation, extensive wounds having healed almost as if by primary union. This stage, however, is but a short one, and if operation is deferred the conditions present in the wound become much less favourable for successful suture. Cicatrisation having progressed rapidly, the tissues have become bound together and have lost their elasticity, so that it is necessary to put considerable tension on the sutures in order to bring the edges of the wound together. Further, the granulations have frequently grown redundant, leading to an increased outflow of pus and a much more abundant bacterial flora.

Many other wounds do not lend themselves to the methods of plastic surgery in consequence of the extensive loss of skin entailed by the original injury or as the result of subsequent operations undertaken to check gas infections, &c. The healing of the wounds, which, for one reason or another, are not closed at an early stage—and at present they constitute the majority of the cases—takes the tedious course familiar to all surgeons, and is particularly liable to be very protracted in its later stages.

It is not proposed here to deal with the treatment of wounds left to heal by natural processes, except in so far as

to call attention to a point not perhaps generally recognised—viz., that the troublesome later stages of extensive flesh wounds, especially those complicated by considerable loss of tissue, may be frequently hastened by vigorous and repeated massage of the hard, tough mass of cicatrix.

In theory, at any rate, it ought to be possible to cut short this tedious stage of the healing process by the application of skin grafts, yet the operation seems to be commonly regarded as a last resort and is comparatively seldom practised; for, since the commencement of the war, only two short contributions to the subject have appeared in the *British Medical Journal*, and in *The Lancet* a single (although very important) letter.

On inquiring into the cause of this neglect the following factors suggest themselves:—

1. *The uncertainty of the method.*—In many surgeons' hands failures have been at least as frequent as successes, and, even when the grafts have taken, the resulting scars have been thin, weak, and prone to ulceration.

2. Anxiety to spare the patient both the immediate misery of a general anæsthetic, as well as the prolonged and serious discomfort associated at times with the healing of the raw surface from which the grafts were taken. Not unfrequently, owing to suppuration having occurred in this area, it has taken longer to heal than the wound or ulcer which was (perhaps unsuccessfully) grafted from it.

The aim of the present communication is to suggest that both these considerations may be ruled out and that the operation of skin-grafting can be placed in the position of a simple, reliable procedure worthy of very wide application in surgery. It may be boldly said that the uncertainty of the method is very largely due to imperfections of technique—in particular the technique of the after-treatment.

The literature of the subject is almost entirely occupied with recommendations of one or another type of graft and the results obtained when the operation has been successful, but very little has been written as to the conditions and causes leading to success or failure. Before discussing these latter it will be of advantage to give a synopsis of the history of skin-grafting.

Historical Synopsis: Reverdin's Method.

For almost all the original work on the subject it is necessary to look back to the period of 1870–86. Whether it originated during the Franco-German War is not clear, but, at any rate, interest in it was first aroused in Paris by the publications of J. L. Reverdin, who having observed the growth of epithelium around islets occurring spontaneously on granulating surfaces, sought to multiply such centres of growth by transplanting small epithelial grafts. These grafts he obtained from the skin over the tibia by the following procedure: Holding the skin in this situation tense, the point of a rather large bleeding lancet was thrust into the dermis, and keeping the blade as nearly as possible parallel to the surface, the point was made to emerge at a distance of 3 or 4 mm.; on continuing the pressure the small piece of skin was effectively detached by the cutting edges of the lancet.

Although commonly spoken of as "epidermic grafts," Reverdin's important communication of 1872 makes it clear that they included, at any rate at their centre, portions of the dermis, which, however, in his opinion, did not become adherent until much later than the larger epidermic portion of the graft.

Reverdin's success with these small grafts appears to have been considerable, and in the paper referred to above he summarises his experience derived from more than 50 cases, together with the publications of surgeons in different countries who had followed or modified his methods. In this paper it is shown that, at this time, grafts taken from another individual had been successfully transplanted, as was also the case when the graft was taken from a negro or an amputated limb. Moreover, the important observation had been made that if a graft was placed near the edge of the wound, or if two grafts were placed close together, a bridge of epithelium was very rapidly formed between their nearest points, whereas the epithelial border around isolated grafts, placed at a distance from the edge of the wound, extended much more slowly, tended to remain circular, and as a rule did not grow beyond the size of a sixpence.

Another remarkable feature of the epithelial islands which developed from Reverdin grafts was their comparative resistance to the morbid changes prone to occur in healed ulcers. Several cases were recorded in this paper, and also others by English surgeons, in which the breaking-down of scars involved all the epithelium formed from the margins of a wound but spared that in the immediate neighbourhood of former grafts. With this in view Reverdin suggested that many more grafts than were generally employed might be with advantage placed on the granulating surface.

As regards histological observations, the most important were made at a somewhat later date by Thiersch, who transplanted Reverdin's grafts on to a limb at varying intervals previous to its amputation. He was able to determine by injection of the main vessels of the amputated limb that vascularisation of the graft had already commenced within 18 hours of its being transplanted on to a granulating surface.

Modifications of Reverdin's Method.

Although Reverdin does not appear to have departed from his original method, other surgeons were not slow to attempt modifications of it. Nelson Dobson, of Bristol, with the idea of making the small epidermic grafts go farther, cut them up on his thumbnail into five or even ten fragments, thereby hoping to multiply the centres of growth. He also, with the view of giving such minute fragments a better chance of "taking," inserted them into small incisions made in the granulations.

The "section grafts" described a little later in the present paper represent a further development of Dobson's procedure.

Fiddes, of Aberdeen, and Marc Sée, of Paris, carried the idea of economy still farther, their procedure being to sow the granulating surface with the tiny collection of cells obtained by merely scraping an area of skin. This method of "epithelial sowing" may be of theoretical interest, but the resulting scars would probably be of the worst type.

With the exception of these two methods all the important modifications of Reverdin's operation have taken the direction of larger grafts.

Several of the English surgeons (who were first to follow Reverdin's lead) preferred forceps and scissors (or scalpel) to the bleeding lancet for removal of the grafts, with the result that these tended to be larger and also thicker than the thin, mainly epidermic, type recommended by Reverdin. These somewhat larger grafts were found to adhere just as readily on a satisfactory surface as the smaller ones, and it was pointed out by Steele, of Bristol, that when treating ulcers which, after healing, would be subjected to great strain and likely to break down, it would be advantageous to transplant a number of fair-sized portions which would certainly retain their elasticity, and so by their individual stretching relieve the tension of the whole surface. This surgeon speaks of his grafts as including the whole thickness of the true skin but none of the fat and areolar tissue, their size varying from that of a large pea to a threepenny-piece, or occasionally even larger. Such grafts were manifestly very different from Reverdin's, and although their actual dimensions would naturally vary slightly in practice it would seem justifiable as well as convenient to use the term "Steele's grafts" in referring to this type, as the present authors will have occasion to do. The fact that these grafts were not generally adopted, and so came to be forgotten, may well have been due to the pain caused by cutting them. The same consideration was probably responsible for the fact that all grafting operations in those days were of very modest proportions—more than ten grafts at a sitting being rarely recorded, the more usual number being three to six.

When, after a few years, anæsthesia came into more general use, Wolfe, of Glasgow, employed what were in reality very large Steele grafts for correcting severe ectropion, &c. What constituted this method a new procedure was really the idea of covering the entire surface to be grafted rather than establishing centres of growth. For this purpose Wolfe dissected off from the patient's arm a piece of skin of the required size—up to 2 or 4 square cm.—carefully avoiding the fat and areolar tissue. In this last detail his flap grafts differed from those which had been employed in India during the eighteenth century.

A later paper by Wolfe suggested that this method might have a wider application in surgery, but it was not apparently taken up until 1893, when Krause put forward the view that such grafts would furnish stronger and more elastic

scars than those resulting from Thiersch's method, which had at that time been in favour for several years. Success, however, seems to have been limited to cases in which the grafts were transplanted on to aseptic wounds, and Wolfe's method has never come into general use for covering granulating surfaces.

Thiersch's Mode of Skin Grafting.

Thiersch's procedure, described by him in 1886, resembled Wolfe's in that it aimed at covering the whole surface to be grafted, but in respect of technique was quite different, the grafts being cut very thin by means of a razor, including only epidermal tissues, and being planted, not directly on the granulations, but on the raw surface from which these had been previously pared away. With the exception of this latter practice of paring away the granulations, Thiersch's method has been more extensively employed than any other during the past 30 years, the work of Reverdin and his followers being almost forgotten. A general anæsthetic, however, has almost invariably been considered necessary for cutting Thiersch grafts, and this circumstance has gone far towards limiting its application to the treatment of very large granulating surfaces. (The need for a general anæsthetic may, however, be called in question, Nystroem, Laewens, and others (1909–1911) having reported that they obtained satisfactory anæsthesia by nerve blocking with novocain, while more recently Pearce Gould and Archer have advocated infiltration anæsthesia for this purpose.)

It will be pointed out later that the uncertainty of results obtained by Thiersch grafting has been chiefly due to imperfections in the technique of the after-treatment, but the large size of these grafts may well be an additional special factor, for, covering as they do a considerable area of granulations with many pits and crevices, they tend inevitably to imprison the discharges, which, by liberating tryptic ferments, digest not only the epithelial outgrowths but ultimately also the actual grafts. To prevent this disaster it has sometimes been recommended that holes should be punched in the grafts.

Other disadvantages of the method have already been mentioned above—namely, the possibility of troublesome sepsis during the healing of the large raw surface from which the grafts were taken; and, finally, most important of all, the inelastic, vulnerable character of many of the resulting scars.

In recent years there has been, in America at least, a return to Reverdin's method, the claim being made by Cotton and Ehrenfried (1909) and by Davis (1914) that, except in cosmetic effect, this procedure gave better and more certain results than Thiersch's method. The grafts employed by these surgeons were obtained by under-cutting with a scalpel little pimples of skin raised on the point of a needle. In size they did not as a rule exceed 3 mm. in diameter, larger grafts being considered less satisfactory.

Viability of Skin.

Lastly, it is necessary to refer to a very important and original communication by Carrel in 1912. He obtained a number of grafts, consisting of the whole thickness of the skin without any of the underlying fat and areolar tissue from a healthy fœtus, which had died during labour, and preserved them in liquid paraffin at + 3° C. After 42 days he found the skin to be normal in appearance, both macroscopically and microscopically, and even after six months their appearance had not markedly changed. At intervals their viability was tested by transplanting portions on to granulating surfaces, with the result that, even up to seven weeks after their removal, some of the grafts "took."

Although, as pointed out above, it has long been established that grafts from one individual may be successfully transplanted, the general experience has been that they are not as a whole so satisfactory as autodermic grafts; notwithstanding this, Carrel's findings, if confirmed, open up new possibilities.

Description of Authors' Method.

The routine procedure worked out by the present authors may now be described in full, since it differs in several respects from the methods usually adopted in the past, the difference tending, it is hoped, towards simplicity and more constant results. The grafting operation, including the method of obtaining local anæsthesia, will first be dealt with; secondly, the after treatment; and, fina ly, the results obtained.

Anæsthesia.

Local anæsthesia induced by blocking certain nerves of the thigh with novocain has been almost invariably employed. If an insensitive area of only moderate size is required the external cutaneous nerves alone are blocked, and about 15 minutes later some 20 to 30 Steele's grafts may be taken without the patient suffering any pain from an oblong area of skin usually about 12 by 20 cm. in measurement situated on the antero-external aspect of the thigh. (Fig. 1, A.) If a larger anæsthetic area is required the anterior crural nerve is also blocked, when the area shown in Fig. 1, B, is rendered insensitive. The technique employed has been substantially that of Nystroem and Laewens; a 2 per cent. solution of novocain with a small amount of adrenalin (1 in 50,000) is the anæsthetic used.

FIG. 1.

The area A represents the size of the anæsthetic patch obtained by blocking the external cutaneous nerves. When the anterior crural nerve is also blocked the further area B is rendered anæsthetic. (The anæsthetic area below the knee has not been indicated as all the grafts have been taken from the thigh.) At C is indicated the point of insertion of the needle for blocking the external cutaneous nerves and also the area to be infiltrated. At D is indicated the point of insertion of the needle for blocking the anterior crural nerve.

To block the external cutaneous nerve the needle is introduced a little below and to the inner side of the anterior superior iliac spine; the tissues both above and below the deep fascia are now infiltrated, the needle being thrust downwards, inwards, and also outwards from the point where it was inserted. The area thus infiltrated is indicated in Fig. 1, C. About 5 c.c. of the novocain-adrenalin solution is used.

The blocking of the anterior crural nerve is much more difficult and requires a strict attention to anatomical landmarks. It will be found an advantage to mark out with a skin pencil (i.) the line of Poupart's ligament, (ii.) the common femoral artery, which enters the thigh midway between the symphysis pubis and the anterior superior iliac spine, and (iii.) a point, barely 1 cm. outside the artery and midway between the spine of the pubis and the inner border of the anterior superior iliac spine; at this point the nerve passes below Poupart's ligament, and to reach it the needle should be inserted vertically not more than 1 cm. below the ligament since the nerve divides at about that level. The nerve usually lies at a depth of 0·5 to 1 cm. below the fascia. When the needle reaches the nerve pain is experienced by the patient, shooting down to the knee, and the quadriceps will sometimes (but not invariably) twitch. Five cubic centimetres of the novocain solution should be injected around the nerve, and, if possible, partly into the sheath.

The authors' experience of this method of inducing anæsthesia is limited to between 20 and 30 skin-grafting operations, and in only one of these—a very nervous individual—was the degree of anæsthesia so light and its duration so short as to be unsatisfactory. As a rule, perfect anæsthesia lasted for three-quarters of an hour and often longer, the patients being quite undisturbed by the removal of the grafts and the sewing up of the little wounds.

When, instead of Steele's grafts, a strip of skin is removed as described below to provide "section" grafts, it has been found more convenient to employ infiltration anæsthesia than nerve blocking.

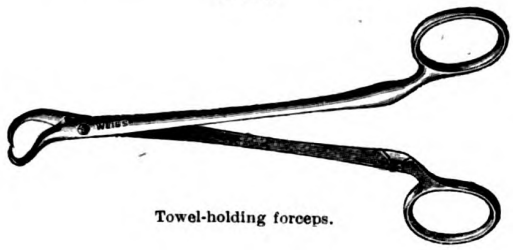
For this purpose a 0·5 per cent. novocain solution, to which 1 in 50,000 adrenalin has been added, is injected into the subcutaneous tissue along two parallel lines of the desired length, about 1·5 cm. apart. An oblong anæsthetic area about 3 cm. wide is thus obtained.

The viability of the grafts taken from such an infiltrated area is not in any way impaired.

The Grafting Operation.

The cutting of the grafts is carried out as follows:—

By taking a superficial but firm hold of the surface with towel-holding forceps* a small cone of skin is raised; it is then extremely easy, by cutting horizontally through the base of the cone with a scalpel, to remove roughly circular grafts of 6 to 12 mm. in diameter, whose cut surface includes, from edge to centre, the epidermis and most of



* As a matter of fact the instrument used, although similar to towel-holding forceps in design and often used as such, is listed in Weiss's catalogue as Backhaus's basting forceps (Fig. 2). The points should be sharp and should meet accurately where they slightly overlap. If this is attended to and the joint kept tight there will be no need to take a deep bite into the skin when lifting it. (The points ould be more strictly parallel than is shown in the figure.)

the dermis, but none of the fatty areolar tissues. Very little practice is needed to obtain grafts of nearly uniform size and thickness.

While still held on the forceps the graft is transferred to its destined position on the wound and there carefully flattened out by means of any simple blunt instrument.

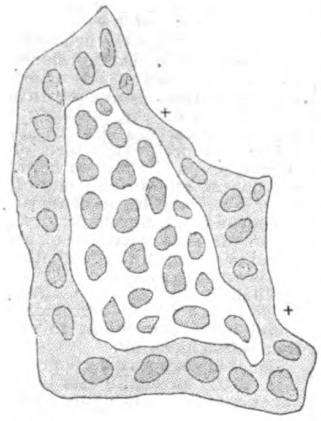
After releasing each graft on the wound the points of the towel-holding forceps are dipped into an antiseptic solution

FIG. 2.

Towel-holding forceps.

in order to avoid the possibility of carrying organisms into the small aseptic wounds from which the grafts were taken. These little wounds in turn are each closed with a single, shallow stitch and the whole area covered with gauze and collodion. It is advisable to leave the stitches in place for from 10 to 12 days.

The disposal of the grafts on the wound is a matter of considerable importance. Reverdin's observation that epithelium spreads much more quickly either between the edge of the wound and a graft, or between two grafts when the interval is not more than 8 mm., than around isolated grafts is constantly being confirmed.



This fact was also strikingly demonstrated by the experimental work of Carrel, who showed that (1) the rate of epithelial growth over an aseptic or almost aseptic surface was inversely proportional to the size of the wound and had no connexion with its age; (2) when the interval between the epithelial edges was more than 10 to 15 mm. the spread of the epithelial edge was very slow, while the growth became quicker and quicker as the edges approached one another.

FIG. 3.

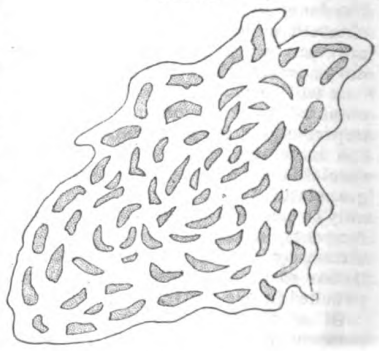
Outline of a wound on the front of the thigh (T. S.) to show disposition of Steele's grafts taken from the other thigh. Every graft "took" perfectly and the surface was entirely covered with epithelium on the fourteenth day after grafting. (From a tracing on thin sheet celluloid.)

FIG. 4.

Tracing of wound on front of upper arm (J. R. H.) to illustrate grafting in two stages. The shaded border shows the new epithelium formed within 12 days about the grafts transplanted at the first operation. Two, out of 22, failed to "take" on that occasion—hence the narrower border at the points marked +. On the twelfth day after the first operation 21 more grafts were transplanted, as shown, on the unhealed centre of the wound; every graft "took" perfectly, with the result that the wound was entirely covered with epithelium on the twenty-second day after the first operation.

These tracings, as well as Fig. 5, are reproduced at half scale.

This and other considerations have led the authors to formulate the following rules:—



I. Whenever possible the grafts should be arranged over the whole surface of the wound as near together as is shown in Fig. 3 or even somewhat closer.

II. If the wound is so large that too many grafts would be required to cover it at a single operation one or two rows should be first placed round the edge, and about 12 days later, when these are well incorporated into the growing edge, the remaining surface should be grafted. Fig. 4 illustrates a case treated in this way.

Another method, to which the term "section grafting" has been applied, deserves to be further tried for the grafting of large wounds, and may here be described. Its particular merits are that it is very economical of skin and leaves no raw area to heal.

An elliptical strip of skin from 5 to 10 cm. long and about 1 cm. wide is dissected off an area of the thigh or arm anæsthetised by infiltration with novocain solution. In doing this care should be taken to avoid including the subcutaneous fat, and any of this found adherent to the strip after its removal should be carefully pared away. The strip is now divided with scissors into thin vertical sections, which are placed in warm Locke's solution and then transferred to the wound, being disposed on it, as suggested above in the case of the round grafts. Fig. 5 shows the appearance and arrangement of such grafts on a wound. The wound from which the skin was taken is in due course closed with sutures.

FIG. 5.

Tracing of wound of back of thigh (C. C.) to illustrate the use of "section grafts." This method was used in this case because some 35 Steele's grafts had previously been taken from the patient's other thigh under local anæsthesia, so that there was not a very large area of skin to draw upon. The 63 sections were obtained by cutting up a strip of skin 9 cm. long by 1·5 cm. wide, taken under local anæsthesia. It will be noticed that the grafts next the edge are placed "lengthwise on."

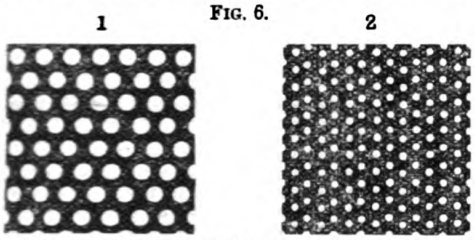
It will be evident that, if this method of grafting proves generally successful, as the authors' cases suggest that it well may, by a refinement of the technique of cutting up the strip of skin, such as a method of embedding without impairing the viability of the tissues, a very small piece of skin could be made to furnish grafts sufficient to cover a very large granulating surface. It is probable, however, that the scars resulting from such thin grafts would, like those resulting from Thiersch's grafts, prove unduly susceptible to slight injuries and trophic ulceration.

In one case a small piece of skin was frozen and cut with a microtome into thick sections, which were then placed on the granulating surface. The result, however, was most unsatisfactory, none of the grafts becoming adherent.

After Treatment.

Grafts newly placed on a wound are exposed to two chief dangers: (1) that of mechanical disturbance before they have become firmly adherent; (2) that of accumulation of pus, which, by the liberation of tryptic ferments, leads to the digestion and disintegration of the epithelial tissues.

Various devices have been employed to protect the grafts from the first of these dangers—e.g., by strips of rubber, of diachylon or zinc plaster, by sheets of oiled silk, or wire filigree, and latterly, with more success, by wool and canvas fabrics coated with some non-absorbent substance such as wax or rubber; from time to time also it has been recommended to use no dressing at all in contact with the grafts.



Whichever of these methods has been adopted the wounds have almost invariably been left undisturbed for several days on the ground that any change of dressing would be perilous to the immobility of the grafts. It is this practice which, in the authors' opinion, has contributed more than any other factor to the failure of skin-grafting operations, for it has only averted the one danger—movement of the grafts—at the cost of greatly increasing the other—the tryptic action of the pus.

In attempting to develop a plan of after-treatment which should protect the grafts from both these dangers search had first to be made for a material which would accurately fit

the irregularities of the wound, hold the grafts securely in position, and at the same time allow of the perfectly free escape of any discharge.

The thin celluloid previously introduced by one of the authors (S. R. D.) was first tried, but was found to be suitable only when the grafted surface was perfectly flat. Various oiled silks and similar fabrics perforated by hand were tried and proved much more suitable; finally, Messrs. Maw, Son and Sons, learning what was required, produced the excellent material depicted in Fig. 6 under the name of

FIG. 6.

"Perforated Parex Protective" (Maw, Son, and Sons, Limited). Size of perforations as shown. (1) will be found most suitable for covering Steele's grafts; (2) for covering "section grafts."

"Perforated Parex Protective." This is simply an oiled fabric suitably perforated; it is strong, durable, and can be boiled; it is sufficiently supple to follow the irregularities of the wound, adheres lightly to the surrounding normal skin, but hardly at all to the granulations or the grafts. Contact with strong alkaline or carbolic acid solutions spoil it.†

When a layer of this material is placed between the grafted surface and the outer dressings it has proved perfectly feasible and safe to change the latter every day following the operation provided these dressings have kept moist. Except in the case of the few wounds which have practically no discharge such a daily change of dressing is not only advisable but indispensable for successful grafting.

Locke's solution,‡ as representing most nearly the blood fluids, is used for cleansing the wound both at the time of operation and also at the daily dressings. Ringer's solution might prove equally suitable, and, failing it, normal salt solution should be used.

Detailed Description of the Routine Dressings.

When the grafts are all in position on the wound the surface is moistened with a fine spray of Locke's solution. The Parex protective is now applied, and should be cut large enough to cover a fairly wide border of healthy skin around the wound, to which it is securely fixed with adhesive plaster. In the case of wounds of the limbs, especially those on dependent surfaces, one or more strands of thread tied round the limb over the protective will help to maintain it in more perfect apposition to the grafted surface.

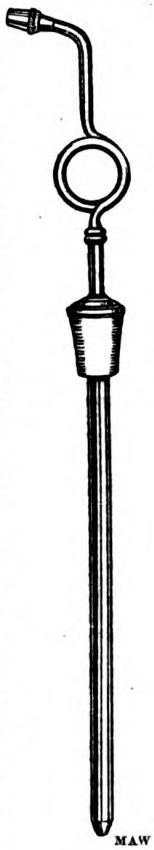
For the outer dressing a roller of butter muslin—not more than double-fold in thickness—is soaked in hot Locke's solution and applied wringing wet by unrolling it to and fro over the wound so as to cover the surface with many thicknesses, which are finally fixed in place by carrying the roller firmly round the limb and securing it with a safety-pin. Over this an amply large sheet of good quality oiled paper is placed; in the case of a limb it should be large enough to wrap right round and overlap by a wide margin. Usually no wool is applied outside this, but it is important that the outer bandage should be firm enough to bind the oiled paper closely to the skin, for in this way evaporation is prevented and the butter muslin retains its moisture for at least 24 hours.

Whenever, as in the case of wounds of the trunk, it is difficult to maintain the oiled paper in such perfect apposition to the skin as to prevent evaporation, it will be found advisable to insert a Carrel's tube, through which a small quantity of Locke's solution is injected at suitable intervals. The type of Carrel's tube used for this purpose consists of a rather fine rubber tube which is coiled amongst the folds of the butter muslin, one end being brought out through the oiled paper and bandage, the other being closed with a ligature and the sides perforated for some 25 cm. with small holes. Through the open end lying outside the bandages the Locke's solution is injected with a syringe.

† This material has also largely supplanted the use of the thin perforated celluloid in the dressing of other types of wounds for the purpose of preventing the sticking of the dressings to such painful surfaces as those occurring after circular amputations, &c. The thicker sheets of celluloid still furnish the best material for the support of limbs in connexion with skeleton splints.

‡ Locke's solution contains, in a litre of distilled water, sodium bicarbonate 0·15 gm., calcium chloride 0·24 gm., potassium chloride 0·42 gm., glucose 1·0 gm., sodium chloride 9·2 gm.

Finally, a simple splint is applied if this will assist in keeping the part at rest or prevent the dressings being disturbed by pressure on the bed or by movements of the patient.



At each daily dressing for a week following the operation the oiled paper is removed, the butter muslin well soaked with Locke's solution by means of a spray, and then removed layer by layer (not turned back *en masse*), the protective being carefully held down by forceps if there is the slightest tendency for its separating from the grafted surface; this, however, is unlikely to occur if the dressings have been kept moist.

The wound may be now thoroughly washed with a fine spray owing to the abundant perforations of the protective, without any risk of disturbing the grafts. Butter muslin soaked in warm Locke's solution is then reapplied as before.

The use of the spray for this purpose, and also in dressing many other wounds, has, in the authors' hands, proved so efficient, as well as economical, as to justify a short note.

The type of spray used is shown in Fig. 7. It is of very simple construction throughout, having one ball valve, which gives no trouble unless allowed to rust, and one of thin leather, which is very easily replaced. On account of this leather washer the spray should not be boiled, but may be readily sterilised by immersion in, and filling with, 5 per cent. carbolic acid solution.

FIG. 7.

A bottle of each lotion in common use may conveniently be fitted with a separate spray and carried from case to case, there being no necessity for resterilisation of the instrument if ordinary precautions are taken to prevent fouling it. The spray delivered by this simple apparatus will be found to cleanse the large wounds at present so common more quickly and effectively, and at the same time with much less discomfort to the patient than the time-honoured, but often very inefficient, glass syringe.

After about a week the protective is removed to determine the exact condition of the grafts, but it is advisable to continue its use for a further period of two or three days in order to save the young epithelium from any possible injury through direct contact with the outer dressings. At this stage, or even some days earlier, Locke's solution has in some cases been replaced by a 0·1 per cent. solution of brilliant green in distilled water, on the ground that this latter solution is said to favour the growth of epithelium, and certainly assists in keeping a granulating surface bacteriologically clean.

While this paper was being written the authors' attention was directed to a letter in THE LANCET of June 3rd, 1916, by Hagmann, a surgeon of Moscow, describing the after-treatment he adopts. This includes, although Hagmann does not emphasise the importance of it, a daily wet dressing, normal salt solution being the fluid used. His grafts were kept in place by a larged-meshed canvas, such as is used for wool work, coated with paraffin wax. With this method of after-treatment, which closely resembles that worked out independently by the present authors, Hagmann states that he has grafted more than 20 wounds without losing a single graft.

Results Obtained.

With regard to the methods described above in detail, it will be asked: (1) In what circumstances, and how often, have the grafts been found to "take"? (2) What has been their subsequent history and what is the character of the resulting scars?

The cases grafted during the period covered by this investigation were drawn from a series of 63 severely wounded men under treatment in the Medical Research Committee's wards of the Inoculation Department at St. Mary's Hospital. With such a small number to choose from, it will be seen that no selection of especially suitable wounds could be made—as a matter of fact, several of the wounds were distinctly unfavourable.

Following the nomenclature employed by certain American authors, the term "autodermic grafts" is used to signify grafts taken from the individual to whom they are applied, while "isodermic grafts" is used when the grafts are taken from another individual or an amputated limb, &c.

The total number of transplantation operations was 33. Of these, in 29 the grafts employed were of Steele's type, 22 being autodermic and 7 isodermic. In the remaining 4 operations section grafts (autodermic) were used. It was usually easy to determine the exact number of grafts which became adherent, so that the success or failure of the operations—in that respect, at any rate—may be expressed in a roughly quantitative manner.

Autodermic Steele's grafts.—The results obtained with this type were as follows: Of the grafts employed—

80 to 100 per cent. became adherent in 12 out of the 22 cases.								
40	80	,,	,,	,,	7	,,	22	,,
5	15	,,	,,	,,	2	,,	22	,,

In the remaining case the result was a complete failure.

These results, although satisfactory, do not really represent the standard of success which could be attained if the cases were selected; some of the cases having been grafted simply to ascertain the limits of the operation, while in others the operation was carried out before the full technique had been developed.

The progress of the grafted wounds and of the grafts themselves has usually been uneventful.

Cases have differed in the rapidity with which the epithelium has spread between the grafts, but once formed it has rarely broken down. The rapidity of sound healing and the strength of the scar seem to be directly proportional to the proximity of the grafts to each other.

In one case only have autodermic grafts been observed to shrink and disappear after they had become securely adherent.

This occurred in a large wound of the buttock which was discharging more freely than any of the other wounds grafted; moreover, the grafts in this case had been disposed indiscriminately over the wound, the authors at that time not having recognised the importance of placing the grafts near the growing edge and in proximity to one another. Of the 50 grafts applied in this case only 23 became adherent, and of these latter but 6 or 7, being those more favourably placed, ultimately survived.

For several months, and probably much longer, the grafts remain clearly visible, standing out from the surrounding scar as opaque areas of normal skin. Although the authors' experience has not been sufficient, nor the period of observation long enough to permit of a well-founded judgment, first impressions are very favourable to the scars resulting from Steele's grafts.

It has occasionally been noticed that in certain grafted wounds, just as in the case of ungrafted wounds, the marginal epithelium previously formed has shown a tendency to break down, but this ulcerative process has not extended to the grafts nor to the epithelium formed around them, which appears to be, for some unexplained reason, more resistant. This confirms the similar observations published by Reverdin.

As to the later stages, it has already been stated that the grafts appear but little changed at the end of six months, and from the literature this seems to be also true of much longer periods. Each of these areas having the appearance of normal skin undoubtedly constitutes, as claimed by Steele, a strong point in the scar, having much more elasticity and also affording a thicker protective covering of compact tissues than is present in naturally formed scars. Moreover, the scars resulting from Steele's grafts have seemed less adherent to the deeper structures.

Isodermic Steele's grafts.—Grafts taken from amputated legs furnished the material for seven transplantation operations, the average number of grafts employed being about 83.

Four limbs were used, all of which had been amputated for injuries received several days or weeks before, and although each presented one or more suppurating wounds there was also an area of approximately healthy skin from which it was judged legitimate to take the grafts. Cultures were made from the cut surface of the grafts taken from each limb and proved sterile. This was of particular interest in the case of one limb which for two months had been the seat of very extensive septic infection, leading to constant fouling of the healthy skin with pus.

It will be agreed that grafts from such a source were not very promising material; they were transplanted in these cases rather with a view to ascertaining the limits of their usefulness than in the expectation of success. The following procedure was adopted for taking them.

Having been kept in a moist cloth until required, the limb was suspended with the severed end downwards; it was then thoroughly washed with soap and an antiseptic solution, the cut surface was roughly sewn up in order to make the skin taut and so facilitate the cutting of grafts in the manner described above under the heading of "The Grafting Operation."

As to the length of time which it is permissible to keep the limb before use, it can only be said here that some 200 successful grafts were taken on one occasion 16 hours after the amputation, the limb having been kept meanwhile at room temperature (in May).§ In five of the remaining six cases the grafts were removed within six hours of amputation and applied at once to the wound—in the sixth case they were also taken within six hours, but kept in Locke's solution at about +6° C. until the following day when they were successfully grafted upon an amputation stump.

It appears to be quite unnecessary to transfer the grafts directly from the limb to the wound, and is certainly far more convenient to cut them elsewhere and convey them to the bedside in warm Locke's solution.

The results obtained with these grafts have been, on the whole, surprisingly good.

On six of the seven wounds to which they were applied 80 per cent. or more of the grafts "took"; in the remaining case, that of a very unsatisfactory wound, the result was very poor, only three or four grafts gaining a hold temporarily.

The cases grafted in this way have been too few and the period of observation too short to show what is the subsequent history of these grafts; up to the present, however, they have given the impression of being somewhat less satisfactory than autodermic grafts. As compared with the latter the epithelial attachment of the isodermic grafts to the granulations has seemed looser, a certain number of them coming away after having been adherent for a week or so, and others standing off the surface at first, with the appearance rather of ragged pieces of false membrane than of healthy grafts; moreover, the spread of epithelium around the isodermic grafts has often been slower than usual, although ultimately they have become consolidated so as to form a firm scar.

With these qualifications it may certainly be said that the use of isodermic grafts in some circumstances is well worth while—e.g., in the case of wounds so large that sufficient autodermic grafts cannot possibly be obtained.

One of the seven cases treated was of such a kind—a burn of the third degree, extending from the iliac crest to a short distance above the ankle and involving more than three-quarters of the circumference of the thigh and leg. Although healing is still far from complete, very large parts of this surface have been covered by two applications of isodermic grafts to the number of about 400 and numerous small centres of growth have also been established.

The results obtained in this case alone prompt the suggestion that the opportunity afforded by an amputation should never be lost when there are large wounds to heal. Whenever possible a Wassermann test of the patient whose limb is to give the grafts should be performed.

Section grafts.—These have been tried in four cases only, the skin being always taken from the patient. A short description of each case is here given.

No. 1. A large wound on the front of the thigh, part of which was grafted with "section" grafts, the remainder with Steele's grafts. The result was that practically all the grafts "took," and the whole wound was soon completely healed.

No. 2. A small granulating surface on an amputation stump; the wound had been previously grafted round the edge with Steele's grafts. Again the result was almost perfect, as about 90 per cent. of the grafts "took," and the whole surface was healed in a few days.

No. 3. A large wound over the popliteal space and a small one over the great trochanter. The patient at the time of the operation had fever and his general condition was not at all good. Two sinuses at the upper end of the grafted wound were discharging pus, and although this was not allowed to come into contact with the grafts the suppuration may have exercised an indirect effect upon the result.

None of the "sections" in this case became adherent, but after 10 to 14 days many delicate points of epithelial growth were noticed on the area where the grafts had been placed, and these quickly spread, causing the wound to heal more rapidly than it would otherwise have done.

The failure of these grafts to become adherent may well have been due to the fact that the limb was not slung after the operation, for, the wound being on the back of the thigh, the dressings must inevitably have rubbed upon the bed and the grafts been more or less disturbed.

No. 4. A wound over the popliteal space, the extent of which is shown in Fig. 5. The wound surface in this case has never been entirely satisfactory, although at the time of grafting it had improved to some extent; one point which was always very noticeable was its extreme sensitiveness, a condition so foreign to the healthy granulating wound as to suggest some slight nerve injury. Three or four days after the grafting there was an increase in the amount of the discharge.

The result of the grafting in this case was again unsatisfactory, as all the grafts were digested by the tryptic action of the pus, but not before about 40 per cent. of them had established small delicate flakes of epithelium, a few of which persisted and afterwards spread, leading to some diminution in the size of the wound.

These cases, although few in number, indicate that this method of grafting is worthy of an extended trial, for the

§ More recently a number of grafts have been successfully transplanted from a limb 28 hours after its amputation.

result in two out of the four cases was quite perfect, and in the other two, although the grafts themselves did not "take," so many islands of epithelium were left on the surface as to considerably hasten the healing of the wound; similar islands of epithelium have also sometimes appeared where Steele's grafts have been applied and failed to adhere.

Remarks on the Conditions of the Wounds which Favour or, as the case may be, are Opposed to Successful Grafting.

There is at present no definite criterion by which a wound surface may be judged as favourable for the operation of grafting.

The authors have supplemented naked-eye observation by film preparations of the discharge. If the bacteria are few in number and chiefly intracellular this is held to confirm the opinion that the wound is suitable for grafting. In a series of cases cultures as well as films were made just before the operation in order to determine whether any particular types of bacteria were specially inimical to the grafts. Staphylococci, diphtheroid bacilli, and *B. pyocyaneus* were the types most commonly present, and although these observations did not show it conclusively, the impression was gained that *B. pyocyaneus* tended to be more harmful than any of the other micro-organisms found.

As regards naked-eye appearances, the most favourable type of wound to graft is one which, on the removal of the dressing, shows a perfectly clean, flat surface covered with small bright-red granulations, quite painless on being touched, and having at the periphery an actively growing epithelial edge; the amount of pus discharged from this type of wound is usually very small.

A less perfect type of wound for grafting, and, unfortunately, a more common one, is that on which the granulations are coarser, paler in colour, less firm, tending to be oedematous and to bleed on the slightest touch; from such wounds the discharge is invariably more abundant.

Frequently this latter type of wound can be brought nearer to the first-mentioned type by the application, for a day or two, of pressure combined with a nitrate of silver, zinc sulphate, or brilliant green lotion.

A wet dressing of 0·1 per cent. brilliant green, enclosed in oiled paper and firmly bandaged, has proved perhaps more valuable than any other in preparing surfaces for grafting, and since, as has been mentioned above, it stimulates the growth of epithelium as well as keeping down the bacterial flora, it has also been used with success in place of Locke's solution a few days *after* the grafting operation.

It may here be mentioned that in a single case a 1 in 2000 solution of flavine was employed on a somewhat unsatisfactory wound surface which it was desired to graft for the second time. Whether due to the flavine or some other cause the result was disastrous, for within three days of its application all the grafts previously transplanted round the edges and the new epithelial border which had formed about them had disappeared. During the same time the bacterial flora changed from a very few *B. pyocyaneus* to many streptococci.

It will be found that by using some such method of preparation of the wound, together with the grafting operation and after-treatment described above, the number of wounds which may be grafted with success is greatly increased, since a moderate amount of discharge, containing but few microbes, will not suffice to digest the grafts when it is daily removed by dressing the wound. Moreover, it has proved perfectly feasible, by division of the dressings, to graft one part of a large wound where the surface is favourable, while in the other part, owing to the persistence of a sinus, too much pus is present. This was done on two occasions with complete success for a large wound on the outer side of the elbow complicated with a compound fracture of the ulna, and healing was thereby hastened by several weeks.

Apart from actually "septic" surfaces, perhaps the most unfavourable surface to graft is that resulting from a large wound complicated with the loss of much tissue. After many weeks of filling up and contracting such a wound shows a surface covered with pale granulations which rest on a dense mass of scar tissue. The worst results of the authors' series occurred with wounds of this type, on one occasion only one graft holding, on the other none.

The last point to be considered is, At what time should the grafting operation be carried out?

From clinical observation it is well known that large granulating wounds rapidly contract in size during the early period of the healing process, and although this contraction may at times be advantageous, at other times it causes any but desirable results, this being especially the case when the wound is in the neighbourhood of a joint or in the region of the face. Further, from similar observations it appears probable that once a wound is covered with epithelium the formation and contraction of scar tissue ceases.

These clinical observations have been strikingly confirmed by the experimental work of Carrel, by which he has demonstrated that (1) the amount and rapidity of the contraction in a wound depends on its size, the larger the wound the greater and more rapid the contraction; (2) the contraction is much more rapid in the early stages of the healing process and in the later stages it tends more and more to become stationary; (3) the contraction entirely ceases as soon as the surface is covered with epithelium; (4) after the healing is complete the cicatrix tends to enlarge.

From these results it will be seen that the correct time for grafting a wound will depend largely upon its situation. Thus if the wound is so situated that any contraction of the scar would tend to limit the movements of a joint, or by pulling on the surrounding soft parts cause some deformity, as in the facial region, it is obviously of paramount importance to obtain an epithelial covering as early as possible; if, on the other hand, the contraction of the granulation tissue tends only to lessen the size of the raw surface without causing any deformity or other disadvantage the grafting operation should be delayed until this process slows down, but the delay should not be prolonged to that stage when, from the contraction of the deep scar tissue, the wound surface becomes unfavourable for the reception of the grafts.

Summary and Conclusions.

In 1869 Reverdin introduced the method of implanting tiny portions of skin upon granulating surfaces to serve as centres of growth.

Steele in 1870 improved upon this by cutting the grafts rather larger and thicker in order to obtain stronger and more elastic scars. His grafts varied in size from the diameter of a pea to that of a threepenny-piece or even larger.

Both of these methods appear to have been widely practised and with considerable success. They were given up, however, in course of time because of the more rapid and striking results sometimes achieved with the method introduced later by Thiersch, which aimed at covering the entire wound surface with grafts at a single operation.

The Thiersch method, in turn, was found to have serious disadvantages; in particular, the adhering of the grafts was uncertain, and the scars resulting from it were often unsatisfactory. Recognition of these drawbacks and forgetfulness of the older methods has resulted in the operation of skin-grafting being now seldom practised, in spite of the great opportunity at present afforded to make use of it.

The authors have revived the use of Steele's grafts and introduced certain new features into both the grafting operation and the after-treatment, which aim at making the transplantation of skin a simple, reliable procedure.

With respect to the grafting operation the chief new, or at least unusual, features are: (1) the use of local anæsthesia induced by nerve blocking; (2) the suture of each of the raw surfaces left after removal of the grafts.

With regard to after-treatment the authors have been influenced by the recognition of the important part played by the tryptic action of pus, which recent work has explained and emphasised. There is little doubt that neglect of this factor has been one of the commonest causes of failure of skin-grafting operations; in consequence the after-treatment advocated has aimed especially at preventing the accumulation of pus while avoiding at the same time any movement of the grafts. The means employed to achieve this were:—

(i.) The employment of a new and suitable material to hold the grafts in position and allow the escape of any discharge from the wound; at the same time it permits the surface to be efficiently cleansed at frequent intervals.

(ii.) The daily change of the outer dressings, which are kept constantly moist with some bland fluid.

The advantages claimed for the methods advocated are that—

1. Successful results can be obtained much more constantly.
2. The use of a general anæsthetic is dispensed with.
3. The raw surfaces left after the removal of the grafts, being closed with sutures, heal rapidly and certainly.
4. The resulting scars are stronger, more elastic, and less prone to ulceration than those resulting either from Thiersch's grafts or from the natural healing of wounds.

In addition, it is probable that by early grafting it will be possible to prevent many of the deformities due to the contraction of scar tissue

The results obtained in 29 transplantations of Steele's grafts are given, 22 of which were autodermic and 7 isodermic. These may be summarised as follows :—

80 to 100 per cent. of the grafts adhered in 18 out of these 29 cases.
48 ,, 80 ,, ,, ,, 7 ,, 29 ,,
5 ,, 15 ,, ,, ,, 3 ,, 29 ,,
In the remaining case the result was a complete failure.

Under the name of "section grafting" an alternative method of obtaining grafts is described which has the merit of being very economical of the skin taken for the grafts, and leaves a simple sutured wound at the site from which the skin was taken. This type of graft was employed in four cases, two of which were perfect successes and the remaining two partial successes.

THE TREATMENT OF WOUNDS OF THE KNEE-JOINT.

BY T. S. NOVIS, F.R.C.S. ENG.,
MAJOR, I.M.S.

INJURIES of the knee-joint met with in military surgery are usually produced by rifle bullets, shrapnel, or pieces of high-explosive shell. Bayonet or sabre wounds are rare. There may or may not be injury to one or more of the bones which enter into the articulation. In some cases injury is so severe as to necessitate immediate amputation, but in the majority of cases an attempt should be made to save the limb.

These injuries may be divided into four classes.

Classes I. to III.

Class I.—Contusions of the joint, caused usually by spent bullets which, though they often lodge in the tissues, do not penetrate the synovial membrane, but give rise to hæmorrhagic effusion into the joint cavity. Thorough cleansing of the wound and removal of the bullet, together with any foreign matter which may have been carried into the tissues, followed by complete rest in a Thomas's knee- or a back-splint with a foot-piece, is usually all that is necessary, though aspiration will in some cases expedite recovery.

Class II.—Wounds of the joint usually produced by rifle bullets fired at a moderate range, which traverse the joint without doing severe injury to any of the bones and in which infective material does not appear to have been carried into the synovial cavity. These cases are suitable for excision of the wound and suture of the synovial membrane, though many cases recover without surgical interference provided the joint is kept at rest, as shown by two cases which have come under my observation :—

One was suffering from arteriovenous aneurysm of the popliteal vessels produced by a rifle bullet which had perforated the patella and passed through the knee-joint, injuring the vessels in its course. No operative treatment had been performed, but three months after the injury all effusion had been absorbed and movements were perfect in every respect.

The other was a case shown to me by Major Fayrer, I.M.S., in No. 5 Indian General Hospital, in which the bullet had penetrated the joint anteriorly, leaving a small wound with dirty-grey edges, from which synovial fluid was freely escaping. The bullet was shown by X rays to be lying between the condyles of the femur at the back of the joint. Fluid drawn from the joint was sterile and the wound healed under antiseptic dressings. The bullet was subsequently removed by operation.

Class III.—Wounds of the joint with gross injury to one or more of the bones which enter into its formation, but in which there is no apparent infection of the synovial cavity. The treatment in these cases should follow the same lines as in Class II., but in addition the fragments of the fractured bone or bones should be placed and maintained in good position, complete rest secured, and the introduction of wire or screws should, as far as possible, be avoided until there are good reasons for believing the danger of suppuration in the joint has passed.

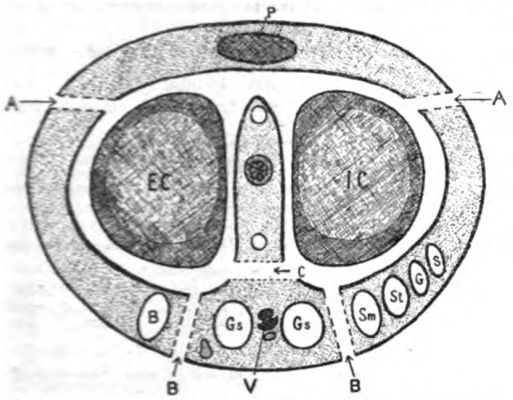
Class IV.: Infected Cases.

Class IV.—Wounds of the joint with or without gross injury to the bones, complicated by the presence of infective material in the synovial cavity. I have placed these cases in one group; but bone injury introduces additional difficulties in treatment, and gravely influences the prognosis.

If the case is seen early, complete excision of the wound, removal of all foreign material, and suture of the synovial membrane after carefully washing out the joint cavity with ether may prove efficacious in mild infections. The treatment should be followed, when necessary, by aspiration and injection of ether, saline solution (1–5 per cent.), glycerine, iodoform-ether, or formalin 2 per cent. in glycerine every day or two until the aspirated fluid is found to be sterile (Dakin's fluid, chloramide, a powerful and comparatively non-irritating antiseptic, might prove a successful substitute for ether). Should the patient get progressively worse or show no improvement after aspiration and injection have been given a few days' trial, more radical methods should be adopted before the knee-joint becomes disorganised.

Unfortunately, no case has come under my care sufficiently early to justify the employment of this method of treatment, but I have tried hypertonic saline irrigation with disappointing results, the patients gradually getting worse until thorough drainage of the posterior pouches had been established. My experience is very limited, but to me it seems possible that the action of hypertonic salt solution in drawing out antibodies is not so potent in the case of the knee-joint as in other regions of the body which appear to have greater resistance to the growth and spread of pyogenic organisms. The anatomical formation of the knee-joint is also such as to render satisfactory lavage through anterior incisions only extremely difficult, if not impossible.

The synovial membrane extends upward under the quadriceps as the subcrureus bursa and forms lateral pouch on either side of the patella, then extends backwards under the lateral ligaments to form the posterior pouches at the back of the condyles of the femur, lining the posterior ligament of Winslow to near the middle line, when it is reflected forward on either side of the crucial ligaments to become continuous in front of these structures. The condyles of the femur fit so accurately into the cups on the head of the tibia and are held in such close apposition by ligaments that it is impossible to pass a sheet of note-paper between the cartilage-covered surfaces; moreover, when the posterior pouches have been freely opened and the front of the joint is being irrigated little or no fluid will drain through these incisions, showing that the knee consists of three almost watertight compartments.



Infection, however, spreads backwards sooner or later, and no amount of vigorous treatment of the anterior cavity will affect suppuration in the posterior pouches. In my opinion the anatomical construction of the joint alone will explain the frequent failure of irrigation when efficient posterior drainage is not provided, and the frequency with which pus finds its way through the back of the joint and burrows amongst the muscles of the thigh and calf, rendering treatment difficult and prognosis bad.

The method of drainage I have employed for the last 12 years in severe traumatic infections of this joint is illustrated in the accompanying diagrammatic section. The method appears to be equally satisfactory in septic gunshot wounds, and was suggested to me by the late Mr. Harold Barnard, though I am not sure the incisions are identical with those described by him.

A free incision is made into the subcrureus bursa and into the lateral pouch (A) on either side of the patella and drainage-tubes of moderate size inserted into the joint. The patient is then turned on his face, an incision made on either side (B) between the hamstring and the gastrocnemius,

and the ligament of Winslow freely incised longitudinally over either condyle of the femur.

In making the external incision care must be taken to avoid the external popliteal nerve which should be drawn inwards with the gastrocnemius. In cases where suppuration is prolonged difficulty may be experienced in keeping open the posterior incisions, but in these cases good drainage can be obtained by making a communication (C) between the posterior pouches in front of the ligament of Winslow and behind the crucial ligament and passing a small tube through from one posterior incision to the other.

Diagrammatic section to illustrate author's method of drainage of knee-joint. A, incisions into lateral pouches; B, incisions into posterior pouches; C, incision to establish free communication between posterior pouches. Bones: P, patella; EC, IC, condyles of femur. Muscles; B, biceps; GS, gastrocnemius; SM, semi-membranous; ST, semi-tendinosus; G, gracilis; S, sartorius; V, popliteal vessels. The nerves are shown but not lettered.

The limb should be fixed on a splint in a slightly flexed position. Mr. Hey Groves's femur splint or the Balkan splint is the most satisfactory, as they allow slight extension to be applied, which adds to the comfort of the patient and delays erosion of cartilage. Moreover, the wound can be dressed without disturbing the limb.

Irrigation with salt solution, weak iodine, or other mild antiseptic should be carried out in the early stages, and if there is much inflammation hot fomentations are beneficial. I usually employ lint soaked in liq. sodæ chlorinatæ (1 in 40). The drainage-tubes should be removed as early as possible, and gentle passive movements commenced as soon as active mischief has ceased. Great care must be taken to prevent the tibia falling back on the femur while the wounds are healing and the ligaments still soft.

Results.

In all five cases of infection of the knee-joint due to the gunshot or shell wounds which have come under my care the time for practising excision of the tissues surrounding the wound and suture of the synovial membrane had passed.

One case had been suffering from suppuration in the joint for four or five weeks, accompanied by severe constitutional symptoms. I drained the joint by the method described above, but as no improvement resulted in general condition, the leg was amputated a few days later. The cartilage was found eroded in places, but there was no collection of pus in any part of the joint. I regret he died from pyæmia, but had his knee been freely drained at an early date, it is my belief that both limb and life would have been saved.

A young Australian, from the lower end of whose femur a shrapnel bullet had been removed and the synovial membrane sutured after excision of the infected tissues, arrived from the Peninsula at the Bombay Presidency Hospital with severe constitutional symptoms and his knee-joint inflamed and distended with pus. The knee was drained through anterior and posterior incisions, and though he went through a mild attack of tetanus, which delayed progress, he recovered with a joint possessed of fair and an increasing amount of movement.

Two other cases from the Peninsula were treated by continuous hypertonic saline irrigation, but as they both appeared to be losing ground I established free drainage five or six days later with satisfactory results.

Another case was under the care of one of my colleagues who, after removing all foreign material and grossly infected tissue, tried continuous irrigation with hypertonic, followed by normal saline solution. The local condition gradually got worse, and after three weeks suppuration appeared in the tissues at the back of the thigh necessitating an incision. A week later I was asked to operate, and found that one of the posterior pouches had ruptured, causing suppuration amongst the muscles, and the other, when incised, discharged about a drachm of pus. His condition steadily improved, until he was transferred on the departure of the Bombay Presidency Hospital.

In conclusion, I wish to emphasise the necessity for free drainage of the posterior pouches. If this is done at a reasonably early stage the large majority of cases will recover with a useful limb and many with a fair range of movement. Complete ankylosis will by no means necessarily follow. I am convinced that too extended a trial of milder methods of treatment has led to the loss of many limbs and lives which might have been saved had free drainage been established earlier. Moreover, free incisions into the posterior pouches will do all that can be hoped for from freely opening up the joint by cutting through the ligamentum patellæ and other ligaments and will leave an infinitely more useful limb.

A NEW PHYSICAL SIGN IN PNEUMOTHORAX AND IN PLEURAL EFFUSION.

BY OLIVER K. WILLIAMSON, M.A., M.D. CANTAB., F.R.C.P. LOND.,

ASSISTANT PHYSICIAN TO THE WESTMINSTER HOSPITAL AND TO THE EAST LONDON HOSPITAL FOR CHILDREN; PHYSICIAN TO THE CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, VICTORIA PARK.

THE sign dealt with in this paper and which, so far as I am aware, has not been previously described, I have found to be present, as far as appears from the number of cases examined, in the great majority of instances of pleural effusion, and it seems to occur in an even greater proportion of patients afflicted with pneumothorax. In fact so frequently have I observed the phenomenon that I consider that it may quite probably be found to be a valuable confirmatory sign of one or other of these conditions, more especially of pneumothorax.

Nature and Explanation of the Sign.

Briefly, the observation consists in the fact of the existence in these cases of a markedly diminished blood pressure in the leg as compared with that in the arm on the same side, a difference usually of at least 10 mm., and in many cases of over 20 mm.

In normal persons the systolic arterial blood pressures taken simultaneously with due precautioms in the arm and leg of the same side (the armlet round both limbs being at the same level) will be found to yield practically identical readings. On the other hand, in certain pathological states differences have been found, the leg reading being higher than that taken in the arm. Thus I have observed differences of this kind in high pressure cases associated with arterio-sclerosis,[1] and Leonard Hill has noticed them as a constant phenomenon in cases of aortic incompetence.[2] Differences in the opposite direction (in which the arm reading is higher than the leg one) doubtless exist under conditions in which there is obstruction to the circulation in the lower extremities, but so far, except in the class of case with which this paper is concerned, I have found only two definite instances: one in a girl aged 15 years, suffering with advanced pulmonary tuberculosis, in whom the leg reading was lower than the arm one by from 12 to 13 mm., the other in a male infant aged 2½ years (diagnosis uncertain), in whom a similar difference varying between 15 and 20 mm. existed. In neither of these cases was there an opportunity of making a post-mortem examination, so that the explanation of the phenomenon in them remains in doubt.

In regard to the explanation of the sign dealt with in this paper it will be remembered that anatomically the pleura on each side, more especially on the left, comes into relation with the descending thoracic aorta as it lies on the vertebral column, and I would suggest the most obvious cause to be that when the pleural cavity is distended with liquid or with gas pressure upon the aorta takes place, such pressure causing to a greater or lesser degree corresponding diminution in systolic pressure distally to the compressed

[1] O. K. Williamson: Clinical Observations on the Influence of the Vessel Wall on (so-called) Arterial Blood-Pressure Readings, Proc. Roy. Soc. Med., May, 1909.

[2] Leonard Hill: The Measurement of the Systolic Blood Pressure in Man, "Heart," vol. i., No. 1.

area. This explanation would be the same as applies in some cases of diminution of the sphygmometer reading in one upper extremity as the result of pressure by the sac of an aneurysm.

In one or two young children with pleural effusion whom I have examined for the sign I have not found it to be present to a marked degree. Perhaps this may be explained by the fact that the chest walls are less rigid in these than in older subjects. Thus, an intrathoracic pressure which in the case of the adult would exercise compression upon the aorta would in the young child be partly dissipated by the yielding chest walls, and would therefore fail to interfere to the same degree with the aortic blood pressure. Accordingly these cases in young children are not included in my series. Further, I have not included effusions in which there are higher leg readings resulting from thickened arteries or aortic incompetence.

The method of observation has been as follows:—

The patient has been at rest in bed, so that the armlet used for the leg reading and that for the arm have both been at the level of the heart. The Riva Rocci type of instrument was used, an Oliver's armlet of width 12 cm. being placed round the upper arm, and another one round the calf of the same side. Both armlets were connected by means of a three-way tube with the same pump and manometer. One observer took the systolic reading in the radial artery, the other in the dorsalis pedis or posterior tibial, and for alternate observations the two observers changed about so that the one who had previously taken the arm reading now took the foot one, and *vice versa*, the object of this procedure being to eliminate any personal equation. The readings taken were those obtained on letting the air out of the armlets after inflating them to a degree greater than necessary to obliterate the pulse in both limbs. The results are recorded in mm. of mercury.

Results of Observations.

These results show distinct differences in five out of the six cases of pneumothorax, and in five out of the seven cases of pleural effusion. In the former the differences are considerable, the average works out at exactly 16½ mm., and in three of these cases the figure reaches a height ranging from 23 to 27 mm. In the cases of pleural effusion the average difference works out at 12½ mm., and in one it actually reaches a figure of 35 mm. The details of the cases examined are as follows. Corresponding observations (on right or left side, as the case may be) on the same line were made simultaneously.

I have to thank my colleagues for allowing me to examine cases under their care; also Dr. C. D. S. Agassiz, Dr. C. G Whorlow, Dr. I. Bastow, Dr. H. Davies, Dr. J. R. Earp, Dr. A. E. P. Parker, Mr. Carpenter, and Mr. Unwin for kindly assisting me in carrying out the observations.

Bryanston-street, W.

SUSCEPTIBILITY TO CEREBRO-SPINAL FEVER IN RELATION TO AGE.

BY ARTHUR COMPTON, B.A., M B. (R.U.I.), D.Sc. (N.U.I.),

CAPTAIN, R.A.M.C. (TEMPORARY); OFFICER IN CHARGE MILITARY BACTERIOLOGICAL LABORATORY, DORSET DISTRICT; ASSISTANT, IMPERIAL CANCER RESEARCH FUND, LONDON; FORMERLY RESEARCH ASSISTANT, INSTITUT PASTEUR, PARIS.

IN continuation of our studies into the etiology of cerebro-spinal fever we have been led to investigate the most susceptible age for the appearance of the disease. Theoretically, as will be seen presently, the question is of considerable interest in its bearing on etiology. Practically, it is also of importance, in view of the fact that many diseases are to-day recognised as showing age incidence, the latter often playing a prominent part for the clinician in the differential diagnosis of numerous conditions.

For the purpose of the present study we have taken data, collected by ourselves, arising out of the epidemics of 1914–15 and of 1915–16 in the Dorset Military District.

With regard to the epidemic of 1914–15, of 31 cases (civil and military) of the disease, about whom accurate information as to age is available, the age-distribution is as follows:—

Age.	Cases %	Age.	Cases %
5 to 10 years.	3·22	30 to 35 years.	9·68
10 ,, 15 ,, ...	4·84	35 ,, 40 ,, ...	6·45
15 ,, 20 ,, ...	22·58	40 ,, 45 ,, ...	1·61
20 ,, 25 ,, ...	37·10	45 ,, 50 ,, ...	4·84
25 ,, 30 ,, ...	6·45	Over 50 ,, ...	3·23

On plotting the percentage of cases as ordinates, and the corresponding age-periods as abscissæ, these numbers give the graphical representation of Fig. 1. This figure shows

that for the epidemic of 1914–15, so far as the Dorset District is concerned, the *apparent* most susceptible age is between 20 and 25.

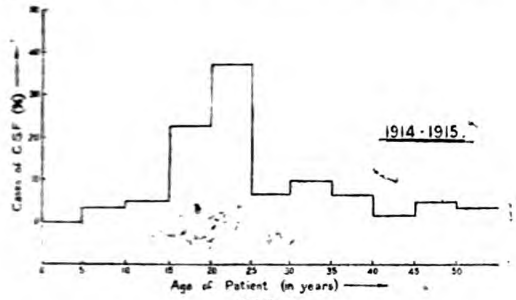

FIG. I.

In regard to the epidemic of 1915–16, of 62 cases (civil and military) occurring in the district from the beginning of July, 1915, to the end of June, 1916, their distribution in terms of age is as follows:—

Age.	Cases %	Age.	Cases %
Under 5 years	1·61	30 to 35 years	4·03
5 to 10 ,, ...	1·61	35 ,, 40 ,, ...	2·42
10 ,, 15 ,, ...	0·0	40 ,, 45 ,, ...	3·22
15 ,, 20 ,, ...	28·22	45 ,, 50 ,, ...	1·61
20 ,, 25 ,, ...	43·56	Over 50 ,, ...	0·0
25 ,, 30 ,, ...	13·71		

On graphical representation these numbers give the curve of Fig. II. This figure shows that the *apparent* most susceptible age is between 20 and 25, in which age-period nearly 50 per cent. of the cases occurred. In this particular the finding for 1915–16 confirms that of 1914–15; indeed,

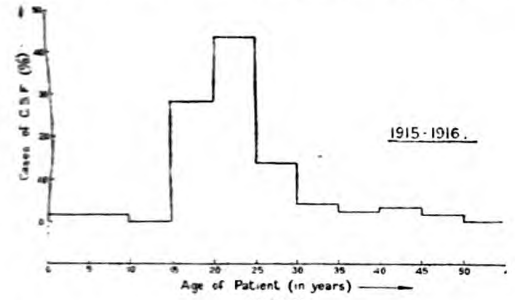

FIG. II.

the parallelism between the two curves is very striking. This age, it will be noticed in passing, corresponds to the military age.

In order to get the *real* most susceptible age, and at the same time to generalise the above finding, the percentage number of cases for each age-period requires to be referred to the percentage number of people of that age-period living in the district at the time.

To get a rough approximation to the latter I have taken the combined statistics of the contacts, 914 in number, of the 31 cases (1914–15), and the contacts, 2109 in number, of the 62 cases (1915–16)—dealt with by the laboratory[1]—and arranged them in terms of age-periods. Table I. sets out the result:—

TABLE I.

Age-period.	No. of contacts.	% Age-distribution.	Age-period.	No. of contacts.	% Age-distribution.
Under 5	6	0·20	30 to 35	325	10·75
5 to 10	13	0·43	35 ,, 40	233	7·71
10 ,, 15	17	0·56	40 ,, 45	141	4·66
15 ,, 20	614	20·31	45 ,, 50	85	2·81
20 ,, 25	982	32·48	Over 50	53	1·75
25 ,, 30	554	18·33			

Now, if we arrange the 93 cases of the disease, to which the above numbers appertain, in corresponding age-periods, and refer the percentage number of cases in each age-period to the percentage age-distribution of that period we get Table II.

[1] Associated, as laboratory staff, with me in connexion with these contact examinations have been: A/Sgt. J. W. J. Leighton, B.Sc. Lond., R.A.M.C. (T.); Corpl. H. L. Smith, R.A.M.C. (T.); Ptes. G. Blunt, T. Dakin, and E. Wigg, of the R.A.M.C.

TABLE II.

Age-period.	Total No. of cases in the district during 1914–15 and 1915–16.	% Cases.	% Cases. / % Age-distribution.	
Under 5	0 + 1 = 1	1·08	1·08 / 0·20	5·40
5 to 10	1 + 1 = 2	2·15	2·15 / 0·43	5·00
10 ,, 15	1·5 + 0 = 1·5	1·61	1·61 / 0·56	2·87
15 ,, 20	7 + 17·5 = 24·5	26·34	26·34 / 20·31	1·30
20 ,, 25	11·5 + 27 = 38·5	41·40	41·40 / 32·48	1·27
25 ,, 30	2 + 8·5 = 10·5	11·29	11·29 / 18·33	0·61
30 ,, 35	3 + 2·5 = 5·5	5·91	5·91 / 10·75	0·55
35 ,, 40	2 + 1·5 = 3·5	3·76	3·76 / 7·71	0·49
40 ,, 45	0·5 + 2 = 2·5	2·69	2·69 / 4·66	0·58
45 ,, 50	1·5 + 1 = 2·5	2·69	2·69 / 2·81	0·95
Over 50	1 + 0 = 1	1·08	1·08 / 1·75	0·61
—	31 + 62 = 93	100·0	—	—

In reckoning the number of individuals occurring in a given age-period those appertaining to the ages which limit the period are counted both ways—e.g., if there were 15 cases of 20 years of age 7·5 would be referred to the period 15–20 and 7·5 to the period 20–25. This is the explanation of the decimals in Column 2.

On plotting the ratios of column 4, in above table, as ordinates and the corresponding age-periods as abscissæ we get the curve of Fig. III. A glance at this figure suffices to see that for the present epidemic the *real* most susceptible age is under 5 years—that is, during infancy and early childhood, while there is a marked falling off of cases after adolescence is passed and adult life is reached; indeed, the least susceptible age would appear to be between 35 and 40.

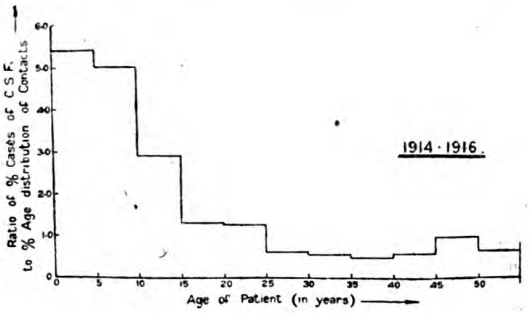

FIG. III.

It is interesting to note that this result establishes the parentage of the present epidemic with that of former epidemics in this and other countries, children in other epidemics, according to most observers, having been noted to be most susceptible to the disease.

But, in addition, the result is of interest from the point of view of etiology. My studies in connexion with the disease in the Dorset district during 1914–15 led me to formulate the hypothesis that cerebro-spinal fever is a weather disease, outbreaks being associated with sudden saturation of the atmosphere by water-vapour, combined with equable conditions of temperature—the meningococcus being about.[2] This hypothesis has been further developed and confirmed by my studies of 1915-16.[3] On this theory the increased facility with which, in the case of the child "carrier," the meningococcus traverses the naso-pharyngeal mucous membrane barrier to enter the system and invade the meninges can easily be explained by the greater fragility and delicacy of the naso-pharyngeal mucosa of the child.

[2] Report to the War Office—Medical Research Committee—of August 2nd, 1915 (Jour. R.A.M.C., November, 1915, pp. 546–570; THE LANCET, 1916, i., 255).

[3] Report to the War Office of Oct. 16th, 1916 (not yet published).

Reviews and Notices of Books.

Diagnosis and Treatment of Surgical Diseases of the Spinal Cord and its Membranes. By CHARLES A. ELSBERG, M.D., F.A.C.S., Professor of Clinical Surgery at the New York University, &c. With 158 illustrations, three being in colour. London and Philadelphia: W. B. Saunders Company. 1916. Pp. 330. Price 21*s.* net.

Professor Elsberg has written a useful book, based on personal experience, dealing with the diseases of the spinal cord and its membranes which may require surgical interference. It is, however, not merely an excellent handbook for the surgeon; it contains material of clinical interest for neurologist and physician. In the first of the three sections of the book, the author is faced with the inevitable problem of how to allot space to spinal anatomy, physiology, and symptomatology. That adequate knowledge of these is essential to diagnosis goes without saying, but how far the surgeon is willing to operate where and as the physician indicates, how far he is keen to make, and capable of making, his own differential diagnosis, are matters which vary with the individual. Professor Elsberg is of those who hold that successful neurological surgery depends on having a working knowledge of organic neurology, but in spite of the general value of the chapters dealing with the factors in diagnosis, it would not be difficult to show that diagnostic problems not infrequently face the neurologist which could scarcely be solved were he to rely only on the information there supplied. The author makes the general statement that if the diagnosis is uncertain and the possibility of a remedial spinal disease cannot be excluded, an exploratory operation may be justified. We hear much of "giving the patient the benefit of the doubt," yet the engendering of false hopes by the mere fact of exploration is to be sedulously avoided, for most neurologists have had cases where operation has aggravated the mischief.

Part II. deals with the surgical technique of spinal operations, and includes lumbar puncture. Part III. deals seriatim with the "surgical diseases" of the spinal cord and membranes. It is instructive to learn that Professor Elsberg has operated with advantage in such conditions as hæmatomyelia, syringomyelia, and even spinal gliosis, making decompressive incisions in the cord. He has also divided the ventro-lateral tracts in the cord for persistent pain of organic origin in the lower parts of the body. Such operations may appear to be rather heroic, and not a few who are familiar with the pathology of these conditions will be unimpressed by some of the author's more sanguine statements. Yet we are in agreement with him in holding that where we are dealing with incurable diseases we are justified in attempting at least a modicum of relief.

The general get-up of the book is excellent; the illustrations are beautiful, and the diagrams satisfactory. While it contains matter that is controversial, and while some of the contentions advanced may be far from meeting with the approval of neurologists or other neurological surgeons, Professor Elsberg is to be complimented on the publication of a contribution to the subject that is both stimulating and instructive, not least in its progressive spirit and the possibilities which it suggests for the future development of the science and art of neurological surgery.

The Secretion of the Urine. (*Monographs on Physiology.*) By A. R. CUSHNY. London: Longmans, Green, and Co. 1917. Pp. 241. Price 9*s.* net.

THE writer of a monograph on the secretion of urine is faced with a difficult task. The difficulty lies in the enormous literature of the subject, in the apparently incompatible nature of much of the evidence, and in the fact that the interpretation of their results has so often been influenced by the predilection of the observers in favour of a particular theory as to the secretion of urine. Professor Cushny is to be congratulated on his achievement in writing this monograph, which for the first time, we believe, presents a dispassionate and critical review of the literature, appraises the value of the more important of the investigations, and places the fundamental features of the problem before the reader in a clear and comprehensive fashion.

After stating the view of Bowman and Heidenhain, and briefly considering some modifications of their theory, the author puts forward the view—which he calls the "modern" view—that the capsule filters off the non-colloid constituents of the plasma, and that the tubules absorb water, sodium chloride, and small amounts of other substances, the composition of the absorbed fluid approximating to that of Locke's fluid. Some of the crystalloid constituents of the plasma are filtered off in proportion to their absolute amount in the plasma, and are called *no-threshold* bodies; others are known as *threshold* bodies, since they are excreted by the capsule only when their percentage in the plasma exceeds a certain value. The striking feature of this theory is the denial of secretory powers to any part of the kidney, and the limitation of the vital activity of the cells of the tubules to the absorption of a fluid of constant composition. In succeeding chapters the evidence for and against the Bowman and Heidenhain theory is critically examined, more especially Heidenhain's experiments on the secretion of dyes, and also the many observations on the frog's kidneys. The conclusion is drawn that Heidenhain's experiments are invalid, and that for various reasons the experiments on the frog's kidney do not furnish decisive proof of the secretory function of the tubules. The author then proceeds to develop the "modern" view and to show how it explains the effects of changes in the blood-supply and of diuretics upon the amount and composition of the urine. The last chapters are devoted to glycosuria, albuminuria, and nephritis.

There is no doubt that the author's view of the process by which urine is formed is logical, and that it affords an adequate interpretation of the majority of the established observations on the kidney; it is particularly convincing as regards diuretics. Further, it was perhaps to be expected that when absorption by the tubules had been definitely established the pendulum would swing in its direction to the complete exclusion of secretion. In our opinion, however, the evidence in favour of secretion by the frog's kidney is too strong to be disregarded, and it is necessary to admit the occurrence, or at least the strong probability of the occurrence, of secretion by the tubules, although possibly to a comparatively limited extent or in special circumstances. This possibility, indeed, is recognised by Professor Cushny. However this may be, Professor Cushny's broad and impartial survey of the whole subject marks a considerable advance towards the solution of the problem, and cannot fail to be of the utmost value to future workers.

The Causation of Sex in Man. By E. RUMLEY DAWSON L.R.C.P. Lond., M.R.C.S. Eng. Second edition. With 22 illustrations. London: H. K. Lewis and Co. 1917. Pp. 226. Price 7*s.* 6*d.* net.

IN reviewing the first edition of this work we pointed ou that in many instances the attempts which have been mad to solve the complex problem of the causation of sex hav been made with an absence of that scientific precisio which is essential if we are ever to arrive at the truth. I the second edition of his book Mr. Rumley Dawson, wh claims to prove that male ova come exclusively from th right ovary and female ova from the left ovary, and, furthe that the two ovaries ovulate alternately and in regular rot tion, entirely ignores all the recent work which has be done on this subject. He takes no interest in the numero and accurate observations on the causation of sex in t lower animals, even though some of them lend a litt support to his view, inasmuch as they tend to prove th the sex is already determined in the ova before they a expelled from the ovary. He brings forward every s called fact which in his opinion tends to prove his hyp thesis, and ignores or tries to explain away all those whi are opposed to it. For instance, the not uncomm example of a run of children of the same sex preceded followed by one child of another sex he convenien accounts for by assuming the presence of a unilate sterility!—a condition in the case of a fertile wom extremely uncommon and in the case quoted entir unproved. If, instead of quoting cases in which he sta his prognostications have been successful, the author h published a consecutive series of fully recorded ca including both his failures and successes, we should inclined to place more reliance on his so-called proofs.

The Combined Treatment of SYPHILIS.

SUPSALVS

STABLE SUPPOSITORIES OF "606" (OF FRENCH MANUFACTURE)

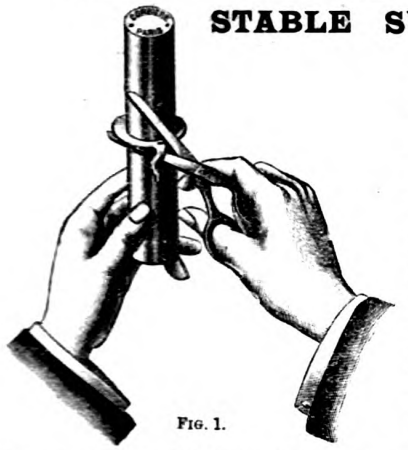

FIG. 1.

Fig. 1 represents the special patent metallic envelope containing a Supsalv for hot climates. The projecting edge in the middle is cut by scissors—the two ends are then easily pulled apart. The envelope should first be immersed in cool or iced water for 10 minutes.

At the International Congress of Medicine Ehrlich stated that the biochemical action of "**606**" on spirochætes is not direct but indirect, a third factor found in the body fluids being necessary.

This success is explained by the well-known experiment of Levaditi: "If living treponemas be placed in a solution of Arsenobenzol (Ehrlich's 606) they continue to live in it. But if a trace of extract of liver be added to the mixture the treponemas are destroyed."

"If 606 has to be taken up and transformed **by the liver** in order to become toxic to the treponema, there is no better mode of absorption of the drug than **by way of the intestine**, since all the **veins of the intestines** join the **portal vein**. If this be the case no route could be more indirect and more unsatisfactory for active treatment than one that is not intestinal or not intravenous (i.e., prehepatic), since some of the drug must necessarily become fixed everywhere before the passage through the liver has activated it."—Dr. Sabouraud, La Clinique (13-4-1913).

As a result of numerous clinical experiments, Dr. Bagrov, of Moscow, has arrived at the same conclusion, and recommends the rectal method of administration of 606.

200 cases were treated by the combined treatment in one of the London hospitals. In each case a negative reaction was attained.

Extremely Simple in use.

No Ill-effects.

Most Satisfactory Clinical Results.

Rapid Absorption.

MERSALV

FOR MERCURIAL INUNCTION IN CONNECTION WITH SUPSALVS TREATMENT.

CHEMISTRY.—"**Mersalv**" contains *10 per cent. metallic mercury*, which by a special mechanical process exists in the minutest state of sub-division possible. It is a *non-greasy* preparation, and, in contra-distinction to other mercurial preparations, contains no organic fats or oils. "**Mersalv**," is of a white creamy consistence, of pleasant odour, and *cleanly in application*.

IN SPECIAL GLASS STOPPERED BOTTLES FOR HOT CLIMATES.

GALYL

Recurrent Fever, SYPHILIS, Frambœsia and Sleeping Sickness.

Practical work with GALYL in the shape of **60,000 INTRAVENOUS** (Dilute and Concentrated) and **INTRAMUSCULAR INJECTIONS** administered in Military, Naval, and the principal General Hospitals throughout the United Kingdom has demonstrated that this preparation is **MORE RAPID** and **LESS TOXIC** in its action than any compound of the "606" group, which accounts for the **consistently excellent clinical results without any undesirable by-effects.**

FORMS:

DILUTE. (INTRAVENOUS).	CONCENTRATED. (INTRAVENOUS).	INTRAMUSCULAR.
GALYL is supplied in neutral tinted glass ampoules, containing the necessary dose of Sodium Carbonate, sterile distilled water only being used for the dissolution.	A special outfit containing 1 dose of GALYL, 1 ampoule sterilised solution, and 1 small filtering tube. DOSES: 0·10—0·15—0·20—0·30 0·35—0·40.	GALYL is supplied in Oily Emulsion. DOSES: 0·10–0·15—0 20 0·30—0·40.

GALYL is now tested in accordance with the requirements of the L.G.B.

3000 injections (intraveneous) were given in one of our **Service Hospitals.** "No case has given the slightest cause for anxiety and the clinical results are very satisfactory." *Staff Surgeon's Report.*

BIOSULFOL

(Assimilable Colloidal Sulphur.)

A GREAT ADVANCE IN SULPHUR TREATMENT.

Sulphur administered in this form by the digestive tract **is entirely absorbed** (90% in worst cases and 100% in others).

Biosulfol gives beneficial results, with which ordinary Sulphur medication, owing to its being only in a small part assimilated, cannot compare.

INDICATIONS:

Skin Diseases.
Chronic Affections of the Pharyngeal and Bronchial Mucous Membrane.
Chronic Affections of the Genital Mucous Membrane.
Chronic Rheumatism (Polyarthritis deformans).
Various Affections of the Joints.
Intestinal Intoxication.
Mercurial and Lead Poisoning, &c.

DOSAGE:

Biosulfol is prescribed in a one-teaspoonful dose, to be taken during each of the two principal meals, pure or in water or milk. It is quite palatable.

LITERATURE ON REQUEST.

THE ANGLO-FRENCH DRUG CO., LTD., GAMAGE BUILDING, HOLBORN, LONDON, E.C. 1.

Antipyrin, Phenacetin, and Pyramidon superseded.

CRYOGENINE

LUMIERE.

NON-TOXIC. EFFICACIOUS. HARMLESS.

Adopted by the French Ministries for War and the Navy, also by the Poor Relief Board. Papers on "Cryogenine" have been read before various Medical Societies by over 90 of the most eminent Continental Medical Men. In each paper clinical results of the most satisfactory character are recorded. "Cryogenine" is a white crystalline powder, odourless and almost tasteless; its chemical composition is Metabenzamido semi-carbazide.

Cryogenine has a high reputation as a

GENERAL ANTIPYRETIC and POWERFUL ANALGESIC.

FORMS.—Tablets, Pills and Powder.

LANCET, Dec. 18th, 1909, p. 1812: "..... The above case is one out of a number of successful results obtained from the use of this remedy (Cryogenine) contrasted with Pyramidon, which certain writers regard as the best drug for phthisical temperature. I think there can be little doubt 'Cryogenine' is the safer and more efficacious antipyretic. ....."
J. E. G———, M.D.

HEMOPLASE

(LUMIÈRE).

Hemoglobin in its Natural State.—Iron in most assimilable form.

HEMOPLASE is a protoplasmic extract from the blood corpuscles of healthy animals. It has had a very extensive and exhaustive clinical trial in a large number of cases (Dr. Gelibert alone reported to the International Tuberculosis Congress the results of 1250 injections), and given consistently excellent results.

INDICATIONS:

MALARIA ANÆMIA
TUBERCULOUS AFFECTIONS
HÆMORRHAGE, &c.

Forms:

In Ampoules for Intramuscular or Hypodermic Injection; also in Pills for Internal Administration. This HEMOPLASE in the dry state contains all the active principles of the liquid form.

'Phone: HOLBORN 1311. **Gamage Building, Holborn, London, E.C. 1.** Telegrams: "AMPSALVAS, LONDON."

The SCIENTIFIC TREATMENT of HAY FEVER and allied ailments.

KINECTINE

According to Dr. MOUNEYRAT, the discoverer of Galyl and Hectine (the widely adopted Salvarsan Substitutes).

FORMULA:

Chlorhydrate of Quinine c. Hectine—i.e., *Benzo-sulfone-para-amino-phenyl-arsenate of Quinine.*

Non-toxic, produces no ill-effects.

Easily taken (tablets) and well tolerated.

Highly satisfactory clinical results:—

AS A PROPHYLACTIC AGAINST HAY FEVER, &c.

RAPID ABORTIVE ACTION IN THE INITIAL STAGES.

CURATIVE ACTION IN THE ADVANCED AND CHRONIC CONDITIONS.

Medical Treatment of CANCER.

CUPRASE

Cuprase is a colloidal Copper hydroxide which is obtained chemically by the reduction of Salts of Copper in the presence of Albumosic Acid. The numerous clinical reports from Doctors of repute in various countries give cases of a great variety. In all of these **pain has been eliminated,** and in a good percentage **cures are claimed,** and in no instance **any undesirable effects.** Its *easy application* (subcutaneous injections) places it within the reach of all practitioners. It *is not toxic.*

Extract from Proceedings of the Royal Society of Medicine, February, 1913.

Dr. George Herschell, comparing electric and chemical colloid copper, stated: "..... **Chemical colloid appears to give the best results.** In the following cases chemically prepared colloid was used. Experimentally it has been proved: (1) That particles of colloid copper can be demonstrated in the granulations of cancerous growths after two or three injections of the colloid; and clinically (2) **There is invariably great relief from pain;** (3) Appetite and strength return and the patient puts on flesh; (4) There is in many cases a diminution in the size of the tumour; (5) **The injections are absolutely non-toxic,** although in many cases an inflammatory reaction is manifested in the cancerous growths.

"As regards my own personal experience in the use of this method of treatment in addition to my own cases, I have had an opportunity of observing the effects in the practice of some of my medical friends, and in nearly all cases the progress of the disease appeared to be arrested."

THE LANCET.

LONDON: SATURDAY, JULY 7, 1917.

The Mesopotamia Report.

THE indictment of the Indian Government, and to some extent of the India Office, and of the general British conduct of Indian affairs which is contained in the Mesopotamia Report, is to receive notice in the House of Commons next week. In the House of Lords Viscount HARDINGE, the Viceroy of India during the commencement of the Mesopotamia campaign, has to some extent defended his own position; but as regards the breakdown of the medical arrangements for that campaign he made no more effective explanation than a confession that he had been misled by his subordinates. The report is very candid and clear and should be read by all our readers, even though they may have assimilated its essential messages from hearsay or the perusal of reprinted excerpts, because it is, among other things, a perfect exposition of the factors upon which effective medical and sanitary administration depend, and a revelation of the way in which those factors are habitually neglected. It is for this reason in particular that we return to the subject of the Report to-day. Medical men, military or civilian, experience extreme difficulty, when it is their duty to take control of their branch of some joint operations, if the superior controlling and directing powers are placed in a position in which no medical advice need be taken and no medical warnings need be heeded. Their presentiments are usually disregarded and their advice neglected. The essential qualities required of the medical men placed in this wise are necessarily foresight and courage—foresight to anticipate what will be the responsibilities falling upon their department, especially if events, over many of which they will have no control, do not progress favourably; and courage to insist upon attention to any requisition which they may make. And all demands from medical men upon a reluctant authority have to be proffered with a full knowledge of the personal advantage to be gained by remaining quiet, and sometimes with contempt for threats of the punishment that may be meted out to recalcitrant subordinates. In some centres of local government, especially in backward provincial towns, the medical officer of health could tell this story from out of his own experience; and there are still places where the man who has the foresight and courage to know what is wanted, and to ask for it, is treated by his local sanitary authority as a nuisance—as one who desires to bring the good name of the community into disrepute. Medical men are, unfortunately, used to this discreditable state of affairs in regard to domestic government, and have not been profoundly surprised to learn that the same miserable situation exists when the greatest interests are at stake. But to the public the whole story of the medical breakdown during the 1915–16 campaign in Mesopotamia has come as an appalling shock, and the blind neglect of medical precautions during the operations is seen to have been due, at bottom, to the fact that the Government of India took no heed of such matters, and looked favourably only upon officials who made no trouble.

The earlier part of the medical arrangements in Mesopotamia were fairly satisfactory, but this seems to have been greatly due to the fact that until the summer of 1915 no very severe strain was put upon medical administration. There was a low rate of sickness in the expeditionary force during the winter of 1914–15, and no battles occurred in which the casualties were so considerable that absence of a full medical personnel led straight to disaster. The defects in the care of the sick and wounded, which afterwards proved so lamentable, were existent during the opening phases of the campaign, but the dangers thus portended were not vividly realised, and there was no persistent representation on the part of the principal medical officer, Surgeon-General HEHIR, that the defects must be made good lest the horrors, which actually occurred later, should ensue. Then came the extension of military operations, the first substantial lengthening of the lines of communication being in May, 1915, up to which time there is evidence to show that, although there had been nothing in the medical administration that could be considered a breakdown, the snapping point in a strained cord was being reached. Surgeon-General HEHIR'S work had been very good, and its success had obscured his sense of the risks that were being taken; but what an efficient officer he was is proved by his strenuous work during the siege of Kut-el-Amara, which lasted 147 days. Surgeon-General HATHAWAY succeeded Surgeon-General HEHIR as principal medical officer to the expedition, and this officer appears to have completely misunderstood the position. Already at the battle of Kut-el-Amara the field ambulances were insufficient in number, the river transport used for evacuating the wounded proved unsuitable, the arrangements for clearing the battlefield were inadequate, and the hardships suffered were great. After the battle of Ctesiphon, which took place in November, 1915, there was, says the Mesopotamia Commission, a complete breakdown, and the circumstances which followed this battle were fully reported upon by a commission appointed by the Government of India to inquire into the medical arrangements in Mesopotamia. By this time the Government of India could not conceal from themselves what all the world knew—namely, that something desperately wrong in the medical machinery had displayed itself. The Commissioners selected were Sir WILLIAM VINCENT, Major-General BINGLEY, and Mr. E. A. RIDSDALE, and their report on the evidence placed before them revealed the medical establishment available for the expedition as quite inadequate to the demands made upon it. Their report is published in full as an appendix to the Mesopotamia Report, and the Mesopotamia Commission endorses substantially, having fuller evidence before it, the findings of

the earlier investigation. After the battle of Ctesiphon, when there were 3500 wounded, there were no proper methods of evacuation—indeed, the first hospital steamer appeared in the river in March, 1916, three to four months after that battle, and one year and five months after the campaign commenced. Yet on Dec. 7th, 1915, Sir JOHN NIXON telegraphed to the Secretary of State for India to say that the wounded had been satisfactorily disposed of, that their general condition was satisfactory, and that the medical arrangements in circumstances of difficulty had worked splendidly. It appears that this telegram was drafted by Surgeon-General HATHAWAY. This, indeed, was a terrible misuse of reticence, as the Commissioners term it, and ten days later a detailed report of the evacuation of the wounded from Ctesiphon was sent from which no one could have gathered that anything untoward had happened. A hushing-up policy was being pursued for as long as possible.

But this policy could not succeed indefinitely, for a large public, both at home and in India, knew something of the tragedy that had been enacted. Major CARTER, I.M.S., who was in medical charge of a hospital ship at Basra waiting for wounded from Ctesiphon, made an independent report contradicting the optimistic remarks of Surgeon-General HATHAWAY, and took thereby that grave risk of meeting with official disapproval which others dared not face—how real that risk was is sufficiently shown by the monstrous fact that for his independent action he was stigmatised as "a meddlesome interfering faddist" and threatened with arrest and degradation. This, to pass from the great imperial to the small local sphere, is exactly what happens to a medical officer of health who publishes in his annual report reflections on the apathy of a sanitary authority. The spirit is one that must be uprooted, and we trust that in the Mesopotamia Report will be found the necessary tools for eradication. We do not call for any penal sentences upon individuals involved in this sorry tale of misery unnecessarily inflicted upon men who were wounded and dying in their country's cause, but the Mesopotamia Report will have failed in its object if it does not make impossible such tragedies in the future. Where the medical arrangements of an expedition are in question the representations of scientific experience must be taken into proper account, and the medical officers in places of principal responsibility must know that their demands will be listened to with an anxious desire to meet them, instead of feeling that the less trouble they give the sweeter will their official life be. It emerges from the Mesopotamia Report that the executive medical officers, one and all, did their duty fearlessly—they suffered and died with the men; the fault lay with those supreme authorities who in times of peace had starved the Indian Medical Service, and who, when in charge of the military and political conduct of the war, sought no medical guidance, or having received it did not follow it, and whose attitude towards those who tried to impress upon them the medical aspects was one of resentment or apathy.

The Economic Production and Distribution of Milk.

WE are glad to note that the Committee appointed in April by the President of the Board of Agriculture to inquire into the production and distribution of milk have issued an interim report dealing with the possible shortage of milk next winter. We agree with the committee that this aspect of the problem calls for immediate attention, as any difficulty in obtaining milk is a serious menace to child welfare. Later we may expect the Committee to deal with the complex problem in various aspects of maintaining milk production at its pre-war level, and we are sure that they should aim at an actual increase; but for the present it is well to speed up economical methods at once in order to avoid a shortage after the period of milk harvest is over. There can be little doubt that great economies could be soon effected if producers would fall into line.

The Committee state, for example, that the outpu of dried milk can be so increased as to add a least 50 per cent. to the supply. They find tha there are in Great Britain some 30 or 40 installa tions for the manufacture of dried milk with a actual total output of between 2000 and 3000 ton equivalent to some 450,000 to 675,000 gallons c liquid milk. Besides these, there are a larg number of factories for the manufacture of con densed milk, and there is every reason for believin that at the present time these plants and fa tories are not all working to their fullest capacit Here, surely, is a splendid opportunity for takir immediate steps to get the maximum outp from all milk-drying and milk-condensing plan during the next few months. The Committee a satisfied that dried and condensed whole milk a useful and reliable substitutes for liquid milk, the main point for the present being to secure t preservation of milk and an increased store provide against the times of shortage when th come. The general principle thus enjoined ca for little criticism, but it must be remembered th the various methods of preservation have th limitations as to the period over which the c densed product will last in a sound state. It doubtful whether there is sufficient accommo tion in refrigerators for keeping such produ the cold storage at present available being, believe, fully employed for the preservation other food products. Again, even milk c densed with a large percentage of suga this may amount to nearly 50 per cent.—is guaranteed by the manufacturers to keep in more than three months, while it is still m difficult to give a warranty of condition in the c of milk condensed without sugar. It may be marked also that manufacturers who use sugar preservative will soon be deterred from so doin consequence of the greatly advanced cost. Con to completely dried milk, there would seem t a bigger future for this product than for the densed variety, assuming that satisfactory s are taken to ensure its keeping sound ov reasonable time, but the fatty contents are p

to get rancid unless the product is packed under special precautions. There is no difficulty in keeping dried skim (i.e., fatless) milk sound, but it is whole milk which the Committee have in mind, and it is the conservation of whole milk which is first in importance.

The report is only preliminary, but its publication may well be called timely owing to the urgency of the points which have been dealt with. There are three main directions in which the Committee propose that action should be taken, clearly realising the nature of the situation. First of all, the uncertainty and sense of insecurity which exist among dairy farmers, particularly in respect of prices, labour and feeding stuffs, should, in the Committee's opinion, be immediately reduced as far as possible. Then the surplus summer milk should be used to the best national advantage in ways which they indicate; and finally the loss of milk during the warm months of the year by waste or souring before it reaches the consumer should be reduced. We are much inclined to share the opinion of the Committee that in existing circumstances the sooner milk is available in a dried and soluble form the better. Then on the addition of water the powder is reconstituted as original milk, and its use has advantages for the community, not only of health but of economy and convenience.

Annotations.

"Ne quid nimis."

A WAR-TIME PATHOLOGICAL MUSEUM.

THE war-time museum continues to monopolise the time and energy of the entire Museum staff of the Royal College of Surgeons of England, and the Conservator, Professor Arthur Keith, F.R.S., in his annual report, just issued, narrates the history of this collection, undertaken at the request of the Director-General of the Army Medical Service, to which we have already briefly alluded.[1] Specimens came in at first very slowly, only 500 having been received at the date of the last annual report in June, 1916. But in the present year more than twice that number have been added, and there are now over 1500 specimens in the collection. A service was established under Lieutenant-Colonel T. R. Elliott, F.R.S., between the pathological laboratories attached to base hospitals and casualty clearing stations in France and the Museum of the College, and at a later date a similar service was arranged between the pathological departments of military hospitals at home and the Museum by Lieutenant-Colonel Sir John Bland-Sutton, who was appointed by the Army Council as its representative in the management of the collection. There was at first no intention of exhibiting the collection, and Professor Keith traces the genesis of this idea in the following terms:—

> Towards the close of 1916 it became apparent to all who realised the educative value which such a collection possessed for Army medical officers that its exhibition could not await the end of the war. Its historical value would remain unimpaired, but its present educative value would be lost. It was realised that it should be made available for study as soon as was possible. In July, 1916, the French Army medical staff opened a museum in Paris (at the Val-de-Grâce) for the exhibition of specimens of every kind connected with military surgery and hygiene. The Director-General of Medical Services in France asked Lieutenant-Colonel T. R. Elliott to visit and report on the Val-de-Grâce Museum. A favourable report was returned; it was found that the museum was enthusiastically supported and visited by officers belonging to all branches of the medical staff of the French Army; it served as a centre for the dissemination of the best available knowledge. The project of an immediate exhibition of military specimens was then taken up by the chiefs of the Medical Department of the Army at home and abroad. In December, 1916, the Army Council requested the Council of the College to suggest the best means "for placing on exhibition the collection of war specimens now assembled in the storerooms of the Museum." The Council of the College undertook to do the best it could. At its request Mr. S. G. Shattock, F.R.S., assisted by Mr. Cecil Beadles, undertook the selection and preparation of specimens for exhibition. In the selection of specimens of a surgical nature they were assisted by Captain Raymond Johnson, R.A.M.C. A nucleus for the exhibition was at once assembled in the hall of the Museum by Mr. Shattock. In this nucleus were assembled specimens which were chiefly derived from the museums of the College and of St. Thomas's Hospital Medical School illustrating the wounds of former wars—Peninsular, Crimean, Franco-Prussian, and South African. A section illustrating the lesions of the present war was also included. Drawings and photographs were added. To this modern section additions are being constantly made as the labours of Mr. Shattock and Mr. Beadles progress.

The aim of those who are responsible for the management of the collection is to have an extensive series of specimens for exhibition in the first week of October, 1917, to meet the needs of the medical officers of the Army. Although the scope is less wide than the collection at the Val-de-Grâce, the collection at the Royal College of Surgeons of England will include not only actual specimens of wounds of all parts of the body, and of the diseases and consequences of military wounds, but also samples of the missiles causing wounds, the various means of treatment adopted, and the results obtained so far as such results can be accurately represented by drawings, photographs, casts, and models. Mr. Shattock, who reports on the pathological department, states that at present there is a very full collection of gunshot injuries, both old and recent, available for examination and study. The valuable series of pathological drawings made by Mr. A. K. Maxwell in France will form part of the exhibition. Means and material for such a central or national exhibition offer no difficulty, but in the lack of skilled museum assistants Professor Keith sees a great hindrance to the carrying out of the scheme, and he concludes that, unless energetic measures are taken to remedy this deficiency, great difficulty will result in dealing with the mass of material now accumulated. We trust that the irksome delay may be capable of removal.

THE DEBT OF MEDICINE TO THE DISCOVERY OF DYES.

IN a series of articles on Science and Industry, published in a supplement to last Saturday's issue of the *Manchester Guardian*, appears one by Dr. C. W. Saleeby on Dyestuffs in Medicine, in which the remarkable influence on the progress of medical science encouraged by the discovery of the coal-tar dyes is discussed. The subject is not in the least new to medical and scientific audiences, but it is none the less interesting. As we have often pointed out, the selective action of dyes on micro-organisms was a step of the utmost diagnostic value by adding to the efficiency of microscopic examinations, and now we are turning this selective action to account in the treatment of numerous infections. The dyes, in short, have laid the foundations of a system of chemico-

therapeutics which promises to be of distinct importance in combating some of the worst human ills. The discovery of a dye substance—e.g., such as acriflavine—which appears to discriminate between friend and foe, only attacking the latter, suggests the possibility of finding further selective substances which are inimical to the human organism, but destructive to the particular disease organisms which are known to have invaded the host. The possibility of successful treatment on these lines is real. Little could William Murdoch have conceived in 1792 when he distilled coal for the first time for producing gas for lighting his house—thus laying the foundations of the coal-gas industry—what great potentialities lay hidden in the distillation whose by-products now yield us such an astonishing stock of valuable synthetics, antiseptics, dyes, and explosives.

THE CROONIAN LECTURES.

Colonel Adami's third Croonian lecture dealing with the agencies producing adaptation to disease in the higher animals commenced by drawing from the data brought forward thus far[1] the conclusions that bacteria are capable of being modified by alterations of environment of certain orders; that the modifications conform with Herbert Spencer's "direct adaptations"; and that not some, but all the microbes subjected to particular orders of alteration of environment exhibit the particular modifications; the hypothesis of "chance variation" in one direction with survival of the fittest is incapable of explaining the phenomena. After calling attention to two examples of direct adaptation in protozoa higher than the bacteria—namely, the conversion of negative into positive chemiotaxis in the myxomycete, Fuligo, and Musgrave and Clegg's observations upon the accustomance of Entamœbæ from the intestine to new bacterial and tissue foodstuffs, Colonel Adami pointed out that the multiplicity of studies of the last quarter of a century upon immunity afforded deep insight into the processes involved in direct adaptation in the higher animals, though no single biologist had dealt seriously with the significance of modern discoveries in relationship to adaptation and evolution. He adduced typical examples to demonstrate that immunisation of the individual is simply direct adaptation. The subjects are immunised so that they can withstand the lethal dose many times multiplied; the blood serum of the immunised animals contains bodies which neutralise the toxin; the cells of the body of the immunised animals elaborate and discharge the antitoxin in great excess over the amount of toxin originally introduced; and in some cases they elaborate this for weeks and months after the introduction of the toxin. What is this but acquirement of a new property which cannot possibly be regarded as the calling into activity of a property previously possessed? The acquirement is something positive, and there can be no alternative hypothesis of loss of inhibiting factors and no possibility of ascribing the new property to the persistence of a chance variation. Antiricin can be produced in rabbit or mouse with absolute certainty; there is here no alternative explanation of "the survival of the fittest," and a parallel is afforded by the production of diphtheria and tetanus antitoxins, the cells which absorb and fix the toxins producing the antitoxins. The more widespread bacteriolytic immunity developed against members of the typhoid-coli group, cholera spirilla, micrococci were held by Colonel Adami to be an acquired power of digestion of unfamiliar proteins. Colonel Adami concluded his third lecture by dealing with the question of the inheritance of acquired pathological conditions in the higher animals, and showed that we have precise evidence of such inheritance, direct and indirect, which fits in wholly with our routine medical experience of the danger of marriage in families where like nervous or other defects are exhibited. Instances of direct inheritance of acquirements are, and must be, rare and limited to cases in which the influences which, affecting the body cells, modify their internal secretions, and through these internal secretions so tell upon the germ cells and their metabolism as to set up similar defects and similar disorders of the internal secretions in the offspring; but we know, as a matter of fact, that the endocrine organs as a class have a profound influence upon the generative organs and upon growth, and, from general experience, that metabolic disorders—gouty and "rheumatoid" states, defect and excess of internal secretions—are heritable. The results of medical research strongly support Darwin's earlier contention that congenital variation is to be attributed to the action or influence of changed conditions upon the parental body, and through it upon the reproductive germs. At the same time they indicate the existence of a limited group of cases in which the Lamarckian principle is exemplified—namely, that of identical inheritance of conditions acquired by the parent. The concluding lecture of the series, which dealt especially with the physico-chemical basis of immunity and evolution, was delivered on June 26th, and will be published in full in THE LANCET shortly.

EPSOM COLLEGE.

THE annual general meeting of the Governors o Epsom College was held at the office in Soho-squar on June 29th. Sir Henry Morris, the treasurer occupied the chair, and in submitting the annua report drew attention to the fact that the Counci had been obliged to increase slightly the annua school fee charged to boys entering the Colleg in Michaelmas term last year or subsequently Since then, he added, the Council had been enable to raise the salaries of the assistant masters, an they had also presented to each master an immediat bonus, and had instituted a "Provident Fund" fo helping sons of medical men either during thei pupilage at the College or on leaving school. W understand that £100 have already been allocate for this purpose, and that the Council wou be glad to receive subscriptions to this en We are glad to note that in spite of the war tl numbers of the school have not gone down, and tl usual athletic and social life of the place has be maintained as far as possible. Since the la annual general meeting J. M. Crombie has be awarded an exhibition in modern history at Chr Church, Oxford, 11 boys have passed the whole a part of the First Examination for medi degrees of the University of London, and 10 ha matriculated at the same University. The For Exhibition has been given to F. W. Black, t Armstrong Scholarship to J. M. Crombie, the Stc Scholarship to W. L. Martland, the Havila Exhibition to A. F. McGlashan, and the High Scholarship to B. W. Roffey. The Jenks Memo Scholarship was awarded by the Royal College Surgeons of England to J. St. C. Shadwell. The Bartholomew's Hospital Scholarship was awarded F. C. W. Capps, and the Middlesex Hospital Schol

ship to E. T. Bailey. The report showed that over 650 Old Epsomians were serving with the forces, of whom 550 had joined one branch or another since the outbreak of the war. In the roll of honour of Old Epsomians were included 62 who had been killed in action, 8 who had died in hospital, 93 who had been wounded, 6 who were missing, and 4 who were prisoners. Captain A. Addenbrooke, who died from wounds, was a master at Epsom. Forty-five Old Epsomians have been mentioned in despatches, 2 three times, and 3 twice, 1 has been awarded the Victoria Cross, 7 the Distinguished Service Order, 1 the Distinguished Service Cross, and 20 the Military Cross. After the report had been adopted and formal business had been transacted a cordial vote of thanks to the chairman, moved by Sir James Reid and seconded by Sir R. Douglas Powell, was carried unanimously.

A DEATH FROM SCURVY.

IN a report of Dr. A. K. Chalmers, the medical officer of health, submitted to a meeting of the Health Committee at Glasgow on June 27th, a death from scurvy was registered as occurring in one of the Poor-law hospitals of the city. The significance of the event being obvious in view of the present conditions of the distribution of food, Dr. R. M. F. Picken accordingly undertook an inquiry into the circumstances under which it had occurred. With the courtesy of the medical superintendents of Barnhill and Merryflatts Hospitals, he was able rapidly to collect the following history:—

Under normal conditions three or four cases of scurvy are admitted annually to each of the Poor-law hospitals. Since the middle of February, however, 50 cases have been admitted, distributed thus:—Feb. 15th to March 14th, 2 cases; March 15th to April 14th, 7; April 15th to May 14th, 15; May 15th to June 14th, 22; since June 15th, 4. The experience of these hospitals is that under ordinary circumstances in Glasgow the disease is confined to males, and the present outbreak preserves this feature. Not a single case in a female has been recognised. Moreover, the disease, so far as it has been recognised, appears to be occurring only in men who are dwellers in model lodging-houses, or who live alone, a fact which suggests indifferent attention to the selection and preparation of meals. The medical superintendent of Barnhill is of opinion that the origin lies in the recent shortage of potatoes, this being the only form of fresh vegetable food which this class of patients is accustomed to prepare. From Dr. Liston it was learned that the history of the Merryflatts patients conforms with this in more than half the cases, although in others it has been impossible to ascertain that any alteration in diet had occurred over a prolonged period before the onset of symptoms. Apart from the lodging-house population occasional cases would appear also to be occurring among the general community, and according to the superintendents of the Royal Western and Victoria Infirmaries several cases, seven in all, have been admitted for treatment since April, and one of these from a rural district near Glasgow.

Deaths from scurvy are now exceedingly infrequent in this country. In Scotland, in 1912, 4 were registered; in 1913, 3; and in 1915, 2; while in Glasgow during these years only 1 is known to have occurred. The facts as disclosed in the inquiry have a practical importance for the public at the present time. Potatoes have long been known to possess antiscorbutic properties. Their richness in starch has probably led to the too easy assumption that during the present scarcity an equivalent may readily be obtained from rice or other cereal also rich in starch. It was found, for example, that the Poor-law patients replaced the potato by bread, but neither bread nor rice has the antiscorbutic properties of the potato. These can most readily be obtained from fresh vegetables. All forms of fresh vegetables are valuable for the purpose, but cabbage has an established reputation for its antiscorbutic properties. Fresh vegetables, however, in one form or another are essential if the risk of scurvy is to be avoided, and where the ordinary forms are scarce a readily obtainable substitute, especially at the present time, may be found in the plentiful supply of young turnip plants which are being uprooted in singling, and which can readily be cooked much as spinach is cooked.

RESEARCH DEFENCE SOCIETY.

THE annual meeting of this society has again been postponed owing to necessities of war, but a report has been issued dealing with the period between June, 1915, and the present time. Little propaganda work has been required, and neither in Parliament nor in the Law Courts has need arisen to defend research. The report, which is signed by Lord Knutsford as chairman, refers to the growing appreciation by the public of the great advances in preventive medicine which we owe to research, and the belief is expressed that in the years which are ahead there will be hardly any need for the sort of controversy in which the society has so often engaged in the years before the war, the best opportunities for usefulness being found not in dispute with antivivisection societies but in wide non-aggressive educational work. The effectiveness of the society's work has been greatly increased by the amalgamation with it of the Association for the Advancement of Medicine by Research. The address of the society is 21, Ladbroke-square, W.

THE PANEL MEDICO-POLITICAL UNION.

THE Panel Medico-Political Union has issued its annual report, and the agenda at the annual meeting may be taken as a pronouncement upon the present shortcomings of the Insurance Acts from the point of view of a considerable body of panel practitioners. Suggestions were also made as to desired improvements, the proposals made varying in the degree of importance attaching to them, as well as in the practical probability of the demands made being acceded to. One of the resolutions before the meeting, for example, the carrying out of which would be the most acceptable and one, at the same time, which ought to be reasonably practicable, relates to the period of final settlement for the year's work. The resolution laid before the Union as to this was—

That the Commissioners should be urged to expedite the final settlement of sums due to practitioners, so that in no case it is delayed after the first quarter of the ensuing year. (Resolution I. B.)

It is difficult to believe that the making up of accounts with sufficient promptitude to ensure this end should be beyond the competence of the clerical staffs employed when peace is restored and when clerical staffs have returned to their normal duties. All matters of improvement involving extra work in large national undertakings not directly concerned with the great national undertaking of winning the war must, however, necessarily be delayed until that desired consummation be attained. There is more room for scepticism as to whether the next resolution (I. C) will receive the same consideration as the demand for prompt payment of earned money. The latter resolution asked—

That the Practitioners' Fund should be credited with interest at the rate of 5 per cent. on all moneys ultimately ascertained to be due to practitioners at, and outstanding after, 31st December of each year.

To charge interest upon money due in respect of medical practitioners' accounts from the date of

their becoming due is hardly customary in the case of general practitioners, and the financial position under the Insurance Acts will probably not be found to be such as would impel their administrators to generosity. Resolution I. E, asking that a subcommittee of the Union should report on the method of remuneration in rural areas, should lead to the removal of grievances affecting practitioners whose work differs widely from that of their urban colleagues. The demand in Resolution V. for a scheme of superannuation for panel practitioners suggests a leaning towards a system of, or approximating to a, State Medical Service, which is inconsistent with a desire to avoid State service believed to be generally felt by the medical profession. The observations made in the Panel Medico-Political Union's report upon the practical aspects of the proposed Ministry of Health in relation to insurance practice may be commended to the attention of panel practitioners as dealing with a subject upon which they are well entitled to form opinions and to make them known, and the same may be said with regard to the paragraph on p. 7 of the report upon "War Bonus or Increased Capitation Fees." The justice of the latter demand does not depend only upon the increased work devolving through war upon the panel practitioner, but also upon increased prices which have been met by large increases of the wages earned by the majority of his patients. If medical attendance for the working classes is recognised by Parliament as desirable, which the passing of the Insurance Act admits, it must also be recognised that reasonable remuneration is due to the medical practitioner in respect of the duties imposed upon him.

WAR BREAD AND ITS FAULTS.

NUMEROUS complaints having arisen in many quarters as to the indigestibility and unwholesomeness of Government regulation bread, the Ministry of Food has appointed an expert committee to inquire into the matter. In a preliminary report issued this week the investigations, so far, appear to show that the bread made from this flour when properly baked is perfectly wholesome, but it is pointed out that there are unavoidable local variations in the flour used and in the methods of bread baking, and it is with points such as these that the committee are now dealing. We have received a communication on this subject from the Metropolitan Committee for War Savings. From this statement it appears that the complaints from the general public come under the following heads: (1) the bread is tasteless and quickly palls on the palate; (2) it is rough on the tongue; (3) it does not appear to be digestible and often produces symptoms of indigestion; (4) in children it has sometimes produced skin eruptions; (5) old people especially find it difficult to assimilate; (6) it often tastes musty and soon goes mouldy; (7) it becomes "sticky" and gummy (ropy bread); and (8) it soon becomes stale and uneatable. Practical suggestions dealing with these points with a view to improving G.R. bread refer to the desirability of obtaining a greater uniformity of qualities and properties in G.R. flour, to limiting the addition of other cereals, to eliminating husk, to reducing the mixed flours to a finer state, to improving the keeping qualities of the bread, to the importance of impressing upon the public the necessity of submitting the bread to thorough mastication, and, lastly, to the question whether in summer the restriction that bread must not be sold until 12 hours old should be suspended.

THE LANCET, VOL. I., 1917: THE INDEX.

THE Index and Title-page to the volume of THE LANCET completed with the issue of June 30th will be ready in July. Owing to the continued shortage in the paper-supply, the Index will not be issued with all copies of THE LANCET, as was the custom prior to the War. Subscribers who bind up their numbers are requested to send a post-card to the Manager, THE LANCET Office, 423, Strand, London, W.C. 2, when a copy of the Index and Title-page will be supplied free of charge.

TENTH REPORT ON PLAGUE INVESTIGATIONS IN INDIA.[1]

MANY valuable additions to our knowledge of plague have been made as the result of the investigations carried out in India under the direction of the Advisory Committee appointed jointly by the Secretary of State for India, the Royal Society, and the Lister Institute. Their reports are always eagerly awaited, and are studied with deep interest and also with much profit. The latest report, the tenth, has recently been issued as "Plague Supplement V." of the *Journal of Hygiene*.

One of the puzzling problems of plague in India is its unequal distribution in that country, and its incidence in some provinces has displayed the same inequality among constituent districts. In previous reports this subject has been partly dealt with, and in the present report a special study has been made of the unequal incidence of plague in the United Provinces of Agra and Oudh, by Majors T. H. Gloster and F. N. White, of the Indian Medical Service, in conjunction with Assistant Surgeons A. N. Mukharji, J. S. Roy Chaudhuri, and C. C. Mitra, along with Sub-assistant Surgeons G. C. Mandel and Manji Ram. Their investigations were begun in the early part of 1911, and their object was to elucidate several points of interest in connexion with the geographical distribution of plague, and with an endeavour to find an explanation of the variation in the degree of intensity of the infection exhibited by several districts in the United Provinces. After giving a general description of the area in question, its physical geography, climate, and population, a summary follows of the local epidemics of plague which have occurred during the decade ended in 1911. Four problems appeared to call for special investigation—namely: 1. Why does the city of Lucknow suffer less severely and less persistently from plague than the city of Cawnpore which is comparatively adjacent? 2. Can any explanation be offered as to why the district of Ballia is the most persistently and severely infected district in the United Provinces? 3. Why do the districts of the Bundelkhand—namely, Jhansi, Jalaun, Banda, and Hamirpur—suffer less severely from plague than the districts of the Gangetic Plain? 4. Can any explanation be offered for the unusually severe epidemic which occurred in the Muzaffarnagar district in 1906–7 and in the Muttra district in 1904–5?

1. *Plague in Lucknow and Cawnpore Compared.*

Lucknow, at the Census of 1911, had 259,798 inhabitants including cantonment, while Cawnpore had 178,557. The causes suggested in the report for the greater incidence of plague in the latter town are: 1. It is a much more important trade centre than Lucknow and has more intimate trade relations with many infected places in India; it is thus exposed to greater risk of infection. 2. Cawnpore is a more rat-infested city than Lucknow, so that when plague infection has been brought to it the chance of the disease becoming permanently established is greater. 3. Cawnpore's extensive trade in grain, the construction of its houses, the density of its population, its narrow streets, and the customs of the inhabitants, living as they do in cl

[1] Plague Supplement No. V., Journal of Hygiene; Tenth Report on Plague Investigations in India, issued by the Advisory Committee, May, 1917. The Cambridge University Press. Pp. 106, with Maps and Charts. Price 7s. net.

proximity to their grain stores and their domestic animals, bring a large section of the people into close association with rats, which convey the plague infection to them by means of infected fleas. 4. The number of fleas found on the rats in Cawnpore is larger than in Lucknow and attains a maximum at an earlier period in the plague season, thus favouring the establishment of infection at an earlier date.

2. *The Severity and Persistence of Plague in the Ballia District.*

Ballia has the unenviable reputation of being the most persistently and severely plague-infected district in the United Provinces, and closely related with this is the persistence of the disease through the non-epidemic season. This latter factor, it appears, may be correlated with (1) the observed high prevalence of fleas in June, July, and August; (2) the meteorological observations which show that in these three months, in 1911, the relative humidity in Ballia was higher than that recorded at any other station in the United Provinces, while Rurki and Gorakpur alone recorded lower monthly mean temperatures during this period. Although the investigators could find no constant relation between the climatic conditions and plague mortality in one district as compared with another, they show that within a given district the relative humidity during the epidemic season appears to influence the mortality, a high humidity during the winter months being associated with severe plague. The greater density of population in the Ballia district may also be favourable to the diffusion of the disease.

3. *The Smaller Incidence of Plague in the Bundelkhand.*

The Bundelkhand includes the districts of Jalaun, Jhansi, Hamirpur, and Banda, and forms a part of the Central India plateau. It is peculiarly liable to suffer from either an excess or a deficiency of rain. Taking the Jhansi district as representing the Bundelkhand, the reporters sum up the salient features of plague incidence in it as follows: (1) Epidemics have only occurred when the atmospheric humidity has been considerably above the normal percentage; (2) epidemics in Jhansi have coincided with epidemics in the Native States of Bhopal and Gwalior, such small imports of grain as are brought to Jhansi for local consumption being derived from those States; (3) it is noteworthy that in 1906–7, although the atmospheric humidity was high and plague was severe and widespread in other parts of the United Provinces, the Jhansi district escaped infection, together with the Central Indian Native States; and (4) the epidemic in Jhansi city in 1911–12 failed to spread throughout the district, although nearly three-quarters of the inhabitants had taken refuge in the surrounding villages. It is possible that this failure of plague to spread was due to the very dry weather which prevailed in March and apparently brought the epidemic rapidly to a close. Plague does not tend to spread in the Bundelkhand except in unusually humid years, very dry and hot climate being unfavourable to the prolonged existence of rat-fleas when separated from their host.

4. *The Severe Epidemics in Muttra and Muzaffarnagar.*

In the Muttra district in 1904–05 no fewer than 51,002 persons died from plague, giving the enormous death-rate from the disease of 66·8 per 1000 of the population. In the Muzaffarnagar district in 1906–07 there were 49,745 fatal cases, giving the very high plague mortality rate of 56·7 per 1000. In both of these districts the severe epidemics were associated with unusual humidity during the winter and spring months. The association of unusual humidity during the winter months in certain districts, with severe epidemics of plague, is so constant a phenomenon that the authors feel justified in concluding that one stands to the other as cause and effect. There are also grounds for believing that this cause exercises its effect mainly through its influence on the length of the life of rat-fleas when separated from their host, for the longer a rat-flea is able to survive in such circumstances the greater are its opportunities in an infected area for conveying the plague bacillus either to rats or man.

The Influence of Saturation Deficiency and of Temperature on the Course of Epidemic Plague.

Dr. Ralph St. John Brooks, of the Lister Institute, contributes a report in which he calls attention to the prompt decline of plague epidemics in Northern India with the onset of the hot weather, and he points out that this has led many observers to conclude that the establishment of a critical temperature is the most important factor in checking the course of the infection. The term "saturation deficiency" means the difference between the actual tension of aqueous vapour present in the atmosphere at the temperature in question and the tension of aqueous vapour that would be present in a saturated atmosphere at the same temperature. As a result of his own investigations Dr. Brooks forms the opinion that: 1. Plague does not maintain itself in epidemic form when the temperature rises above 80° F., accompanied by a saturation deficiency of over 0·30 of an inch. 2. Plague epidemics are rapidly brought to an end in the presence of a high saturation deficiency, even when the mean temperature throughout and after the termination of the epidemic has been considerably below 80° F. 3. Plague epidemics may commence and increase in intensity when the mean temperature is well above 80° F., provided that the saturation deficiency is below 0·30 of an inch. 4. In some districts in India, and in certain tropical islands, such as Java and Mauritius, where the climatic conditions are at all times of the year favourable to the incidence of plague, the disease may occur indifferently at all seasons. The adverse influence of high temperature and saturation deficiency may be explained by their effect on the duration of life of the rat-flea when separated from its host. Dr. Brooks's paper is illustrated with 18 charts; it is well worth study by all who are interested in the epidemiology of plague.

NATIONAL BABY WEEK.

DURING the past week a special effort has been made by 200 or more towns and villages throughout the United Kingdom to draw the attention of the people as well as of the local authorities to the value of child life and to the need for doing everything possible to ensure a healthy motherhood and babyhood. In London the care of motherhood and infancy was made the text of addresses in many places of worship on the Sunday. On Monday the Queen opened an exhibition at the Central Hall, Westminster, illustrating in graphic way the essential features of infant welfare propaganda. At one of a series of important conferences held in the same hall the pension scheme for mothers as carried out in the United States was explained by Judge Neil, of Chicago. At the Guildhall, also on Monday, three Ministers of the Crown—Lord Rhondda, Mr. H. A. Fisher, and Mr. Hayes Fisher—addressed a representative gathering at which the Duchess of Marlborough proposed, and Mr. Ben Tillett seconded, a resolution pledging those present to use their influence to secure improved housing and sanitation, together with adequate provision in their own districts for the care of maternity and infancy. To-day (Friday) the best means of increasing the supply of practising midwives is the topic of a meeting held under the auspices of the Association for Promoting the Training and Supply of Midwives at 34, Queen Anne's-gate, Lord Balfour of Burleigh presiding; the speakers include Dr. E. W. Hope, medical officer of health of the city and port of Liverpool. The subject of housing also claimed the attention of a representative meeting at Brighton, when the mayor compared the town to a ragged garment with a golden fringe. Behind its beautiful sea-front Brighton had, he said, many ragged patches, and he trusted that after the war old houses would be pulled down wholesale. Sir Arthur Newsholme spoke at this meeting of the necessity for eliminating venereal diseases and for providing maternity homes for women who could not count on proper care at home during confinement. At Liverpool an elaborate programme was carried out during the week, an address being delivered by Sir Francis Champneys on the Promotion of the Welfare of Motherhood and Infancy.

QUEEN'S UNIVERSITY, BELFAST.—At the recent Final Examinations in the Medical Faculty of the Queen's University of Belfast two candidates obtained the M.D. degree. Twenty-nine entered for the M.B., and of these 19 passed. Miss M. Georgina Thompson (daughter of Dr. George Thompson, Bellaghy, co. Derry) was first of all the candidates, for which distinction she gained the £20 exhibition. She was also first in Midwifery, and was awarded the £30 exhibition, and first in Medicine, but as no candidate can hold exhibitions in more than one group this special prize in medicine was divided between Mr. C. J. A. Woodside and Mr. F. Hopkins. Mr. J. Lascelles was awarded the special exhibition in Surgery. First-class honours were given to Miss Thompson, Mr. Woodside, and Mr. Hopkins, and second-class honours to Mr. Lascelles, Mr. R. Meyer, Mr. G. V. Allen, and Mr. F. H. Whyte.

THE LUMLEIAN LECTURES AND MEDICAL RESEARCH:

THE ACTION OF DIGITALIS IN AURICULAR FIBRILLATION.

To the Editor of THE LANCET.

SIR,—In my letter published in your issue of June 23rd I am aware that I was "asking for trouble," and am not surprised that Dr. T. Lewis has joined issue. Dr. Lewis assumes that I doubt the existence of auricular fibrillation, but as my letter dealt almost entirely with the effects of digitalis in auricular fibrillation in mitral stenosis I fail to see how he can have arrived at that conclusion. Indeed, I was induced to enter this controversy by Professor A. R. Cushny's interesting paper,[1] in which he pointed out that the action of digitalis in auricular filbrillation which occurs pathologically in man differs materially from that which is observed in the same condition induced experimentally in animals. The vagi being put out of court, the whole controversy turns on whether the beneficial action of digitalis in auricular fibrillation in mitral stenosis is entirely due to its action in producing a certain degree of heart-block. My contention is that mere slowing of the heart is an insufficient explanation of the marked improvement that follows, and that it is the action of digitalis in restoring the tone of the exhausted muscle so that it contracts more powerfully which plays a more important part than the cutting off of a certain number of stimuli from auricle to ventricle. The arguments I brought forward in favour of this were fully stated in my first letter, in which I laid stress on the serious disturbance of the hydraulics of the circulation resulting from mitral stenosis, which could not be rectified by mere slowing of the heart. Dr. Lewis entirely ignores these points, and in traversing my statement that digitalis is of value in heart failure associated with mitral incompetence he goes so far as to say, in speaking of its effects in auricular fibrillation, that "There is no comparable series in which, with a normal sequence of chamber contraction, digitalis has been shown to have a similar effect or, in fact, *any striking beneficial effect*." (The italics are mine.)

As Dr. Lewis will not accept my statements as to the value of digitalis in heart failure, let me quote Sir James Mackenzie,[2] who says of digitalis: "The condition of heart failure where it acts best is where there is dilatation of the heart with healthy *muscle fibres that have been exhausted in the endeavour to overcome abnormal resistance*. This effect is best seen in old rheumatic affections of the heart, but it may also be observed in other cases with a fair amount of healthy muscle." I think most clinicians will endorse this statement.

Dr. Lewis complains that I use the term "neurogenic" in connexion with the impulses transmitted by the narrow strand of specially differentiated muscle in the auricular-ventricular bundle. Yet this plays so important a part in conduction and in the phenomena of heart-block that it subserves the function of a nerve rather than that of a mere muscle. Dr. Lewis also criticises my use of the unscientific colloquialism "pick-me-up," but I note that on the approach of "Baby Week" he waxes pathetic on his children being mauled and scolded by a childless neighbour, and himself thus lapses from the path of strict scientific phraseology.

In my first letter I made no personal attack of any kind, but simply wished to raise the question whether the beneficial effects of digitalis in auricular fibrillation could be attributed wholly to its producing partial heart-block and its action on the cardiac muscle be entirely disregarded. This is the point at issue.

I am, Sir, yours faithfully,

JOHN F. H. BROADBENT.

BENEDICT'S TEST FOR SUGAR IN THE URINE.

To the Editor of THE LANCET.

SIR,—I have lately had a number of complaints from medical men that they have been unable to obtain satisfactory results when testing urines for sugar with the Benedict solution supplied to them by the local chemists. On inquiry I find that in every instance the solution had been prepared according to the directions given in a trade publication, and that this solution is that described by Benedict for *quantitative* work, although the fact is not stated. It may be helpful, therefore, if I point out that Benedict's *qualitative* solution, employed in testing for sugar, is prepared as follows. With the aid of heat dissolve 173 grammes of sodium (or potassium) citrate and 100 grammes of anhydrous (or 200 grammes of crystallised) sodium carbonate in about 700 c.c. of distilled water. Dissolve 17·3 grammes of pure crystallised copper sulphate in about 100 c.c. of water. Cool the solutions to the room temperature, pour the second into the first, slowly and with constant stirring; make up to 1000 c.c. with distilled water.[1]

The difficulties of having two separate and distinct solutions for qualitative and quantitative work may be avoided by employing the modified Benedict solution and methods of estimating sugar in the urine and blood I recently described.[2]

I am, Sir, yours faithfully,

Nottingham-place, W., July 3rd, 1917. P. J. CAMMIDGE.

ACUTE INTESTINAL OBSTRUCTION BY MECKEL'S DIVERTICULUM.

To the Editor of THE LANCET.

SIR,—In your issue of June 30th Lieutenant-Colonel E. Mansel Sympson records a case of acute intestinal obstruction by Meckel's diverticulum. Recently I operated on an infant seven days old for a similar condition. At birth the child had a patent Meckel's diverticulum protruding from the umbilical cord just beyond its attachment to the skin. The child passed flatus and the bowel acted through this abnormal opening and also by the natural passage. On the fifth day after birth the child commenced to vomit and gradually obstruction of the intestine became complete. On the seventh day the abdomen was opened The small intestine (the ileum) was found to have invaginated itself into the Meckel's diverticulum, dragging with it the mesentery. This case is somewhat similar to that recorded by Lieutenant-Colonel Sympson, and would suggest a tendency in cases of Meckel's diverticulum for the ileum to pass into the diverticulum and cause intestinal obstruction.

I am, Sir, yours faithfully,

E. DRYBROUGH-SMITH, M.D. Edin.

Shebbear, Devon, June 30th, 1917.

THE SIGNIFICANCE OF CAPILLARY MARKINGS IN PULMONARY TUBERCULOSIS.

To the Editor of THE LANCET.

SIR,—The evidence given by Dr. R. Crawshaw Holt respecting this phenomenon in THE LANCET of June 30th reads ambiguously. For example, he notes that of 351 individuals examined, 147 were between ages 6 and 14 years. Of these 147 who had fallen under suspicion of having tuberculous deposits in their lungs—so one gathers from the context—8 showed tubercle bacilli in the sputum. How does he classify the remaining 139?

Again, he speaks of "red" markings. Does he exclude those that are as distinctively blue? Curiously enough, the colour differs in different subjects. It is not uncommon to find only one of these little striæ. Does he class such as positive or negative?

Of the 63 which showed bacilli, which, therefore, his statements allow us to regard as indubitable instances, 40, or approximately two-thirds, showed no capillary markings. The observations being apparently uncontrolled, there is no

[1] Glycosuria and Allied Conditions, p. 33.
[2] THE LANCET, April 21st, 1917, p. 613.

basis for an inference that the remaining 23 showed these markings because they had pulmonary tuberculosis. It may have been so, but is not demonstrated by this evidence.

In a letter to THE LANCET of April 8th, 1916, I stated that the phenomenon in question is by no means rare in young people who give no proof or even suspicion of having intrathoracic tuberculous deposits.

I am, Sir, yours faithfully,

Liverpool, July 1st, 1917. EDMUND HUGHES.

*** Far more evidence is wanted before this matter can be usefully discussed further.—ED. L.

RHUBARB LEAVES AND FLOWERS AS A VEGETABLE.

To the Editor of THE LANCET.

SIR,—The question of the use of rhubarb leaves as a vegetable having acquired some prominence of late in the public press, and certain cases of alleged poisoning as result of this use having been cited, the subject has become important, particularly at the present moment when it is our concern to enlarge rather than restrict the dietetic boundaries. For this reason I am anxious to draw attention to the points which follow, in the hope that they may contribute to the elucidation of the matter and amplify the comments which have already appeared in your columns (May 5th and June 2nd, 1917).

In Queen Elizabeth's time we read that "rhubarb leaves were used as a potherb and considered superior to spinach or beet," whilst "the use of the tender leaf-stalks is, comparatively, of modern date." From the same source we learn that in the *Gardeners' Chronicle* for 1846 the large globular pouch of unopened flowers, when dressed in the same manner as rhubarb, forms a "dish of great delicacy."[1] From another source[2] we gather that the Don Cossacks were accustomed to eat "the shoots and the leaves of Rheum rhaponticum, in springtime, in their soup, as a remedy efficacious against the scurvy." In King Henry VIII.'s time it appears that the common sorrel, *Rumex acetosa*, "was held in great repute" and used "as spinach or in salads."[3] This custom has prevailed down to the present day, especially in France.

Now both of these plants belong to the same natural order, Polygonaceæ, and both present an acidity which, in so far as the palate is concerned, must be counted among their virtues. This acidity is constituted in part by oxalic acid, free or more probably in combination, either as the acid potassium salt, HKC_2O_4, 2 Aq, or as the hyperacid quadroxalate, HKC_2O_4, $H_2C_2O_4$, 2 Aq. It is true that oxalic acid is present also in the tissues of rhubarb in another form, namely, in combination with lime as calcium oxalate, but this salt is so insoluble that to whatever extent it may occur in the leaves of rhubarb it can take no part in their acidity; indeed, we may consider that in this form the activities of oxalic acid are effectively cancelled. It is, however, necessary to remember that in the cooking of vegetables it is common practice to add soda to the water, and, soda salts in general being so soluble, it is reasonable to inquire whether in this way more of the oxalic acid present may not be extracted and become effective as soluble oxalate? But since, according to Fownes, the normal sodium oxalate is only slightly soluble, and according to Bernthsen it is the *least soluble* of the alkaline salts, both acid and neutral, we may put aside this interpretation of things as unlikely.

In the cases of alleged poisoning by rhubarb leaves already alluded to, the poisonous action has been attributed to the oxalic acid present. But the term poison has no significance apart from dose; reduce this sufficiently and, even in the case of the most virulent poisons, toxicity vanishes completely. What is the evidence from this quantitative point of view?

In a recent case of supposed death from rhubarb leaves[4] it was stated at the inquest that the leaves contained approximately equal parts of potassium binoxalate and of calcium oxalate, of each 10 grains in the pound of leaves—i.e., 10 grains of soluble or active oxalate, and 10 grains of insoluble or inactive oxalate; the latter may be dismissed as playing no part, for we remember that the antidote to oxalic acid poisoning is a lime salt. If, therefore, a whole pound of the leaves had been eaten, the effective poisonous dose in this instance will have been 10 grains, and if we regard a third of a pound as a fairly liberal helping, the lethal dose will have been reduced to one-third—say 3½ grains. But the smallest quantity of free oxalic acid, probably the most active form of all the oxalates, which is said to have been the cause of death in a boy of 16, is 60 grains, and, on the other hand, recovery has taken place after the swallowing of an ounce and a quarter.[5]

The state of the stomach, full or empty, is always an important element when estimating toxic action, which may be due to local or to systemic action (after absorption) or to both, but in the case in question, in which the rhubarb formed part of a meal, it must be clear that 3½ grains diluted by the contents of a full stomach could not cause any local damage to the mucous membrane, and that this dose, the eighteenth part of the minimal fatal dose, became lethal after absorption!

It must, then, be admitted that the evidence incriminating the leaves in this particular case is scarcely convincing. In conclusion, it may be added that in the writer's household the use of rhubarb leaves as a vegetable has been in common practice during the last three or four years and still continues. An undoubted laxative action attends this use, but this should be reckoned as virtue rather than as vice if the use be regulated accordingly.

I am, Sir, yours faithfully,

HARRINGTON SAINSBURY.

THE MEDICAL DIRECTORY.

To the Editor of THE LANCET.

SIR,—The annual circular asking for information for the Medical Directory, 1918, was posted to members of the profession on July 3rd. We are anxious that those forms should be returned to us as promptly as possible. If in any cases the circular has not been received a duplicate will be sent on application. It is especially desirable that those practitioners whose addresses are included in the London Postal District should return the new district numbers.

We are, Sir, yours faithfully,

THE EDITORS.

7, Great Marlborough-street, London, W., July 3rd, 1917.

URBAN VITAL STATISTICS.

(Week ended June 30th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was 11·7, against 12·8 and 12·4 per 1000 in the two preceding weeks. In London, with a population exceeding 4,000,000 persons, the death-rate was 11·3, or 0·9 per 1000 below that recorded in the previous week; among the remaining towns the rates ranged from 4·4 in Enfield, 4·5 in Eastbourne, and 4·7 in Edmonton to 20·3 in Exeter, 20·6 in Rotherham, and 21·0 in Carlisle. The principal epidemic diseases caused 278 deaths, which corresponded to an annual rate of 0·9 per 1000, and included 148 from measles, 59 from infantile diarrhœa, 37 from whooping-cough, 22 from diphtheria, 7 from enteric fever, and 5 from scarlet fever. The deaths from measles showed a further decline compared with the numbers in the four preceding weeks, and caused the highest annual death-rates of 2·5 in West Hartlepool, 2·9 in South Shields, 4·5 in Middlesbrough, and 6·2 in West Bromwich. The 606 cases of scarlet fever and 1051 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 19 above and 16 below the numbers remaining at the end of the preceding week. Of the 3796 deaths from all causes in the 96 towns, 131 resulted from violence. The causes of 29 of the total deaths were uncertified, of which 6 were registered in Birmingham and 3 in Manchester.

Scotch Towns.—In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual death-rate was equal to 13·6, against rates steadily declining from 17·0 to 15·8 per 1000 in the six preceding weeks. The 296 deaths in Glasgow corresponded to an annual rate of 13·8 per 1000, and included 27 from whooping-cough, 24 from measles, 2 from diphtheria, and 1 from infantile diarrhœa. The 83 deaths in Edinburgh were equal to a rate of 13·0 per 1000, and included 5 from measles, 2 each from scarlet fever and whooping-cough, and 1 from diphtheria.

Irish Towns.—The 92 deaths in Dublin corresponded to an annual rate of 12·0, or 5·4 per 1000 less than that recorded in the previous week, and included 3 deaths from infantile diarrhœa and 2 from whooping-cough. The 94 deaths in Belfast were equal to a rate of 12·5 per 1000, and included 2 from enteric fever.

Mrs. Lumley-Dann writes to say that "Mascot Day" has been abandoned, but small replicas of Captain Besley's 5000-year-old, pre-Inca mascot can be secured post free by sending half-a-crown to "Mascot," 1, Marylebone-passage, Wells-street, Oxford-street, London, W. 1. The proceeds go to a group of private hospitals, under the War Office, in need of assistance.

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue :—

Killed.

Capt. M. Greer, R.A.M.C., attached Royal Welsh Fusiliers, was educated at Liverpool University and qualified in 1907. He had held appointments at the Liverpool Stanley Hospital, at the Liverpool Dispensary, and at the Leeds Public Dispensary, and was in practice at Corris, Merionethshire, prior to joining the R.A.M.C.

Died.

Temp. Capt. F. C. H. Piggott, R.A.M.C., was educated at Cambridge and at St. Thomas's Hospital, London, and qualified in 1884. He was formerly assistant demonstrator to the professor of physiology at Cambridge and H.B.M. Acting Consul for East Soudan, and prior to joining the R.A.M.C. was in practice at Teignmouth, South Devon, where he was medical officer of health of the Union and Port Districts and held other appointments.

Wounded.

Capt. G. F. Fawn, R.A.M.C., attached Rifle Brigade.
Lieut. V. T. C. Bent, R.A.M.C., attached N. Staffs. Regt.
Lieut. J. S. Clark, R.A.M.C., attached Yorks Regt.
Lieut.-Col. R. H. L. Cordner, R.A.M.C.
Capt. J. L. Baskin, R.A.M.C., attached London Regt.
Capt. I. Campbell, R.A.M.C.
Capt. A. J. Smith, R.A.M.C., attached Middlesex Regt.
Capt. L. H. Skene, R.A.M.C., attached Royal Fusiliers.
Capt. A. E. Sutton, M.C., R.A.M.C.
Capt. C. N. Binney, R.A.M.C.
Capt. W. V. Corbett, R.A.M.C.
Capt. A. Juett, Australian A.M.C.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of medical men are reported :—

Major R. R. B. Wall, Royal Field Artillery, killed in action, sixth son of the late Surgeon-General T. F. Wall.
Capt. and Flight Commander J. W. W. Nason, Royal Sussex Regiment and Royal Flying Corps, killed in action, son of the late Dr. C. St. S. R. Nason, of Gloucester.
Second Lieut. C. R. Barrett, Royal Field Artillery, died of wounds, second son of Dr. W. P. Barrett, of Folkestone.
Private P. G. Watson, Royal Berks Regiment, killed in action, eldest son of Dr. S. G. Watson, of Southsea, formerly of Brighton.
Major C. R. M. Young, Royal Garrison Artillery, died of wounds, eldest son of Dr. M. Young, J.P., of West Hartlepool.
Lieut. L. S. Bowman, King's Own Royal Lancaster Regiment, and Royal Flying Corps, killed in action, only son of Dr. R. O. Bowman, of Ulverston, Lancs.

THE MESOPOTAMIA REPORT.[1]

The Mesopotamia Report, published at the end of last week, is issued at the accessible price of 2*s*., and has already received such wide notice in the daily press that all our readers may be assumed to be familiar with its general findings. Nothing in the Report has moved the public more than the revelation of the circumstances of the medical breakdown which occurred in the latter part of 1915, inflicting the most terrible suffering on the sick and wounded, whose numbers were so greatly increased by the extension through Kut-el-Amara to the vicinity of Bagdad of our lines of operation.

The following are the findings and conclusions of the Commission in respect of the treatment of the sick and wounded and the medical provision generally :—

The medical provision for the Mesopotamia campaign was from the beginning insufficient; by reason of the continuance of this insufficiency there was a lamentable breakdown in the care of the sick and wounded after the battle of Ctesiphon and after the battles in January, 1916; there was amelioration in March and April, 1916; but that since then the improvement has been continual until it is reasonable to hope that now the medical provision is satisfactory.

The defects of medical provision caused avoidable suffering to the sick and wounded, and during the breakdown in the winter of 1915–16 this suffering was most lamentably severe.

The deficiencies, which were the main causes of the avoidable suffering of the sick and wounded, were in the provision of the following: (*a*) river hospital steamers; (*b*) medical personnel; (*c*) river transport; (*d*) ambulance land transport. To these fifth and sixth main causes may be added in respect to the operations in January, 1916: (*e*) The absence of the medical and supply establishments of the 7th Division; (*f*) the premature efforts to relieve Kut in consequence of the erroneous estimate of supplies in that place.

As to personal responsibility the Vincent-Bingley Commission[2] found: "That a grave responsibility for that part of the suffering which resulted from avoidable circumstances rests with the senior medical officer of the force, Surgeon-General G. H. Hathaway, and with General Sir John Nixon, the general officer commanding the force, from April 9th, 1915, to January 19th, 1916. General Hathaway did not represent with sufficient promptitude and force the needs of the services for which he was responsible, and in particular failed to urge the necessity for adequate and suitable transport for the sick and wounded with that insistency which the situation demanded. General Nixon did not, in our opinion, appreciate the conditions which would necessarily arise if provision for the sick and wounded of his force were not made on a more liberal scale." We endorse the finding as regards Surgeon-General Hathaway who in our judgment showed himself unfit for the high administrative office which he held. We may add, however, as regards river and land transport, that while it was the duty of Surgeon-General Hathaway to urge its necessity, it was actually the duty of the Quartermaster-General's department and of Sir John Nixon's staff to see that it was provided. So far as Sir John Nixon is concerned, however, we think that he was throughout solicitous as to the condition of the wounded. The main mistake he made was to rely too absolutely on the statements made to him by his Deputy-Director of Medical Service, Surgeon-General Hathaway; to that extent he may be blamed, but he stands, so far as responsibility is concerned, in a very different position from that occupied by Surgeon-General Hathaway.

The officer directly responsible for the deficiencies of medical provision in Mesopotamia is, however, the Director of Medical Services, India. This appointment was held at the beginning of the war by Surgeon-General Sir William Babtie, who held the office between March, 1914, and June, 1915 but was away from India for six weeks in February and March, 1915. He was succeeded by Surgeon-General J. G. MacNeece on July 8th, 1915, and the latter proceeded home on sick leave on April 15th, 1916. Sir William Babtie in his evidence before us impressed us as an officer of ability and knowledge, but we do not think that he brought these qualities sufficiently to bear upon the task before him. He accepted obviously insufficient medical provision without protest and without any adequate effort to improve it. He cannot, therefore, be held blameless. Surgeon-General MacNeece did not give evidence before the Vincent-Bingley Commission, but he appeared before us. He was, in our opinion, an officer thoroughly desirous of fulfilling the duties assigned to him; but he was a man of advancing years and diminishing strength, unequal to the position he was called upon to fill, and his administration appears to us to show no signs of the vigour and efficiency that were required.

We find that (*a*) the Home Government agreed with the Indian Government in limiting the general military preparations of India before the war in the interests of retrenchment, and provision was accordingly not made for such an expedition as that to Mesopotamia. The limitation of medical preparation and the low standard of medical treatment in the Indian Army at the outbreak of war were the natural outcome of this policy, which was pursued for many years and was in force right up to the date of the war. (*b*) The private letters of the Secretary of State to the Viceroy showed an earnest and continuous anxiety as to the condition of the wounded, and the only comment that can be made upon the Secretary of State's procedure is that he did not fully utilise the official powers at his disposal for the purpose of forcing at an earlier period an investigation into the treatment of the wounded in Mesopotamia. (*c*) To Lord Hardinge of Penshurst, as Viceroy, belongs the general responsibility attaching to his position as the head of the Indian Government, to which had been entrusted the management of the expedition, including the provision of medical services. In regard to the actual medical administration he appears to us to have shown throughout the utmost goodwill, but considering the paramount authority of his office his action was not sufficiently strenuous and peremptory. (*d*) A more severe censure must be passed upon the Commander-in-Chief, for not only did he, as Commander-in-Chief of the Army in India, fail closely to superintend the adequacy of medical provision in Mesopotamia, but he declined for a considerable time, until ultimately forced by the superior authority of the Viceroy, to give credence to rumours which proved to be true, and failed to take the measures which a subsequent experience shows would have saved the wounded from avoidable suffering.

There has been misuse of official reticence as to medical defects and the sufferings of the sick and wounded.

While the protective and sanitary work of the Medical Administration has in certain directions and at some periods (notably under Colonel Hehir) been commendable, yet there has not been generally sufficient promptitude in taking the precautions dictated by modern science for the protection of the troops against disease.

Throughout the campaign (with insignificant exceptions) the executive and regimental medical officers and personnel have devoted themselves with unremitting kindness, zeal and industry to the care of the sick and wounded with such means as were at their disposal.

Commander Wedgwood's separate Report, wherein it differs from the Report of the Commission, adds nothing to our knowledge of the medical arrangements in Mesopotamia.

THE CALLING UP OF MEN CLASSIFIED AS BIII. OR CIII.

A circular from the Local Government Board suggests that some misapprehension has occurred with regard to an Army Council Instruction recently issued as to men in

[1] Report of the Commission appointed by Act of Parliament to Enquire into the Operations of War in Mesopotamia, together with a Separate Report by Commander J. Wedgwood, D.S.O., M.P., and Appendices. H.M. Stationery Office. 2*s*. net.

[2] This Commission, appointed by the Government of India, reported on the medical arrangements in Mesopotamia in June, 1916. The Report is published in full as an appendix to the Mesopotamia Report, in which its findings are substantially adopted.

medical categories B iii. or C iii. The instruction was issued to recruiting officers, and directed that, for the present, men in these medical categories are not to be called up or posted unless they are clerks or are following a trade useful to the Army. So far as tribunals are concerned, these bodies, says the circular, should deal with the cases of men in these medical categories in the ordinary course on their merits, in accordance with the directions already issued to them. In any case in which exemption is not justified and is therefore refused, the men will be available for the Army if they should be required, or may be used as substitutes.

THE CARE OF THE WOUNDED: THE TAG SYSTEM IN THE RUSSIAN ARMY.

It may be of interest to our readers to know something about the tag system used by the Russian Army. The following tag, which measures 4 × 7 in., is tied around the neck of every wounded soldier as he leaves the regimental dressing station:—

Front of Tag.

No. .....

Rank .....
Company No. .....
Battalion No. .....
Regiment No. .....
Surname .....
Christian name .....
Father's Christian name .....
What doing when wounded .....
Nature of wound .....
Wounded, contusion, bullet .....
Shrapnel, piece of shell .....
Bayonet, sword .....
Head, breast, stomach, joint .....
Arm, leg (upper or lower) .....
Broken bone, bone not broken .....
Diagnosis .....

Back of Tag.

Date .....

First dressing station .....

What disposition was made .....

Discharged, well, on leave .....
Returned to regiment .....
To sanitarium .....
Army Investigation Bureau .....

REPRESENTATIVES of the Swiss Red Cross have recently been visiting prisoners of war camps in India.

THE RED CROSS EMBLEM IN INDIA.—The Red Cross emblem has hitherto been flaunted loosely in India, and an Ordinance has been published restricting its use to certain named societies such as the St. John Ambulance Association and its allied bodies.

RED CROSS GIFTS.—The gift of £7,500, which Major W. Napier Keefer, of Toronto, recently sent to the King, has been disposed of in the following manner: £2,000 to the Star and Garter Home, £2,000 to the Nurse Cavell Homes, £1,000 to the Auxiliary Hospitals for Officers' Department of the Pinewood Sanatorium, £500 to the Prisoners of War Central Fund, £1,000 to the Military Orthopædic Hospital, Dublin, and £1,000 to the Ulster Volunteer Orthopædic Hospital, Belfast. The King has also handed an additional £2,000 to the Joint War Committee of the Red Cross and Order of St. John for the treatment of sailors and soldiers suffering from deafness.

NEW WAR HOSPITALS IN INDIA.—The Raja of Ratlam has arranged to equip and maintain a war hospital of 38 beds at Indore for British troops.—The Parsis of Karachi have given the Parsi Institute, the Jehangir Kothari Hall, the Katrak swimming bath, and the entire grounds and premises of the institute to the military authorities for a hospital.

UNITED STATES HOSPITAL UNITS ON THE BRITISH FRONT.—It is announced that nearly 2,000 officers and other ranks of the United States Army Medical Service are at work in the British War zone.

A TECHNICAL SCHOOL FOR DISABLED SOLDIERS IN BOMBAY.—A technical school for disabled soldiers has recently been opened in Bombay. The institution is designed to serve a twofold object: artificial limbs will be fitted and the men will be instructed in their use; they will further be taught suitable occupations, so that they may not be encumbrances upon their relatives. The first part of this work will be under the supervision of Major L. Hirsch, I.M.S., who has already been engaged in similar duties in the Bombay War Hospital, and the cost of this teaching will be borne by Government.

Obituary.

CHARLES THEODORE EWART, M.D. ABERD.,

MEDICAL SUPERINTENDENT, LONDON COUNTY ASYLUM, CLAYBURY.

WE have received the following appreciation of the late Dr. C. T. Ewart from the pen of one who worked with him at Claybury on the close and intimate terms of official superior.

Clinical psychiatry has lost a devoted as well as an able and interesting personality by the death of Dr. Ewart. It is unspeakably sad that he should have been called away from the work of his life just as he was happily enjoying the climax of his ambition, for which he had long waited and which when at last attained he maintained with honour and the utmost credit—viz., the post of medical superintendent of the London County Council's large asylum at Claybury, with nearly 3000 beds, to which he was temporarily appointed only last September.

All who knew Ewart respected his loyalty, the love that he had for the work of tending upon the insane, his anxiety for their comfort and welfare, as well as his great reserve of perseverance and patience. It is not too much to say that no man was ever more respected by the staff, nor more loved by his patients for the special qualities which make a successful medical officer of a large institution. Those who knew him never failed to realise his great tenderness in speech and action, for sympathy was in the nether springs of his nature. He never turned a deaf ear to the most trivial complaint, even when made by the most unreasonable of his patients, and he readily gave an interview to the most unamenable and the most perturbing spirit. He regarded his patients as his friends, and he gave much of his time unstintedly to "interviews with friends" in order to reassure anxious relatives that the patient was receiving the best curative and remedial treatment. His sincerity always carried confidence and conviction.

He delighted in that introspective mental analysis which characterises so many Scotsmen, and his great pleasure was in a contemplative philosophy which sustained some religious, reflective, or mystical trend. He had initiative, original powers, and an inventive, suggestive mind; but he possessed the defects of his qualities. His calm, contented disposition, his mysticism (usually associated with a keen intellect), and his optimism militated against his achieving early success. He was self-resourceful and self-reliant, sympathetic, possessed a deep feeling of altruism with a most hopeful temperament, and had an imposing and pleasing presence; all these, combined with his refined intellect and good manner, made him a most popular and charming character.

Dr. Ewart was never keen to attend meetings. He was lost in a self-assertive crowd, and he loved so much more the personal touch, for he was the quiet scholar and he felt into the soul of things. He contributed on occasions to magazines and journals of varying standards, writing in the *Nineteenth*

Century, the *Westminster*, *Empire*, *Quest*, *Chambers's Journal*, and others, and he excelled in magazine articles rather than in contributions to medical literature because he had a passion for extending his sympathies beyond his special sphere. This lure of something more than was apparent in things made him search for the deeper realities, but in spite of his philosophic tendency he was practical in action. He was one of the earliest to draw official attention to the value of special industrial colonies for those afflicted with epilepsy, and he may be correctly described as the originator of the scheme adopted later by the London County Council when the colony for the insane epileptic was founded at Epsom. He was the first to institute the training of nurses in the London asylums upon the basis of a syllabus adopted by the St. John Ambulance Association, as a recognition of which he was elected an honorary life member of the association. He took the greatest interest in physical drill for mental patients, many of whom in asylums need some encouragement to perform muscular movements, especially those of a general, orderly, and sustained kind; and he was a firm believer in the maxim *mens sana in corpore sano*. He was an ardent naturalist, and loved the country with all its pursuits; he was a "plus" golfer, and well known at some of the principal links, a keen cricketer and football player, a good opponent at tennis, and a useful hockey hand; but owing to a football accident, which brought on a strained knee, he was obliged of late years to moderate his athleticism.

Dr. Ewart was the son of a judge of the High Court in Jamaica, and married whilst at Claybury a daughter of the late Mr. Abraham Flint, of Chigwell; she with a daughter are left to mourn the loss of a devoted husband and father. Last Easter he suffered from an abscess of the vermiform appendix, which was successfully treated in a nursing home in London, and on Saturday, June 16th, he was further operated upon in his home at Claybury for appendicitis. The writer saw him the day before he died, when the wound, owing to complications, was reopened and the abdomen re-examined. He was then calm, composed, and self-reliant, his only thoughts being for others. He died from exhaustion and shock four days after the operation, having for a few months only reaped the fruits of a too long deferred promotion. His remains were laid to rest by his own wishes near to the scenes of his long labours and with every mark of love and respect. He will be tenderly recalled by several present medical superintendents who were his colleagues at Claybury, as well as by many matrons of the institution, as a sincere and generous friend. R. A.-J.

FRANCIS HENRY KNAGGS, M.R.C.S. ENG.,

OPHTHALMIC AND AURAL SURGEON, HUDDERSFIELD ROYAL INFIRMARY AND HUDDERSFIELD WAR HOSPITAL.

Mr. F. H. Knaggs, who died on June 24th from pneumonia after a brief illness at the age of 56 years, was the third son of the late Dr. Samuel Knaggs, who practised for many years in Huddersfield. He was educated at the Huddersfield College and at Rossall, taking his medical course at Guy's Hospital, where he held appointments in the eye and ear departments, being later clinical assistant at the (Moorfields) Royal London Ophthalmic Hospital. After a term of two years as house surgeon at the Gloucestershire General Infirmary and Eye Institution he commenced general practice in 1889 with his father and steadily gained in reputation as a specialist in eye and ear affections. For several years he assisted his brother, Mr. R. Lawford Knaggs, in the ophthalmic and aural department of the Leeds Public Dispensary, and in 1905 became honorary surgeon to the recently created ophthalmic and aural department at the Huddersfield Royal Infirmary, to which his father was for many years senior honorary surgeon. His death thus breaks a connexion with that institution which had existed since its first establishment. From the date of its opening in October, 1915, Mr. Knaggs had been a civilian medical officer at the Huddersfield War Hospital, and in January last received a commission as temporary captain in the Royal Army Medical Corps. He leaves a widow and one daughter and a wide circle of friends to mourn their loss. Mr. Knaggs was formerly honorary secretary of the Huddersfield Medical Society, where he read a number of practical papers on ophthalmic subjects, some of which were published in our columns.

Medical News.

UNIVERSITY OF MANCHESTER.—At examinations held recently the following candidates were successful in the subjects indicated:—

FINAL M.B. AND CH.B. EXAMINATION.

Mercy D. Barber, W. T. G. Boul, Hilda K. Brade, Frances G. Bullough, Kathleen L. Cass, Ruth E. Conway, Jacob Holker, Norman Kletz (distinction in Medicine and Surgery), E. N. P. Martland, A. B. Platt, Jacob Shlosberg, D. M. Sutherland (distinction in Medicine), and Harry Taylor.

Medicine.—C. F. J. Carruthers and Elizabeth C. Powell.

Surgery.—Elizabeth C. Powell.

Obstetrics.—C. F. J. Carruthers, J. C. T. Fiddes, and R. S. Paterson.

Forensic Medicine and Toxicology.—T. H. Almond, Sybil Bailey, Mary G. Cardwell, James Charnley, J. C. T. Fiddes, F. L. Heap, John Mills, Kathleen O'Donnell, M. C. Paterson, Harriet R. L. Reid, Norah H. Schuster, L. J. Schwartz, V. T. Smith, and Marie Wardman.

THIRD M.B. AND CH.B. EXAMINATION.

Pharmacology and Therapeutics and Hygiene.—Elizabeth C. Davies, Kathleen Doyle, Georgiana M. Duthie, Olive M. Gimson, F. G. Hamnett, Simon Kelly, J. N. Laing, J. G. Nolan, Olga G. M. Payne, Ellis Pigott, F. L. Pickett, Effie Ratner, William Reikan, Annie G. Thompson, Doris M. R. Tompkin, and Ruth A. Wilson (distinction in Hygiene).

Hygiene.—Mary E. Boulen (distinction), Percival Fildes, and Archibald Harris.

DIPLOMA IN DENTISTRY.

Final Examination.—T. F. Healey, James Kershaw, and C. H. Travis.

UNIVERSITY OF SHEFFIELD.—At examinations held recently the following candidates were successful:—

M.B., CH.B. DEGREES.

Final Examination.—Annie Clark, Ethel M. Mathews, and Winifred H. Wells (first-class honours and distinction in Medicine and Surgery).

Third Examination.—John V. Mainprize, Alice White, and Ethel White.

First Examination.—Mary P. Gell, Ronald D. S. Inman, Muriel R. Laycock, Elsa F. Paige, and Doris Pindar (distinction in Chemistry).

The Kaye Scholarship was awarded to Dorothy E. Mathews, and the Clinical Gold Medal to Winifred H. Wells.

UNIVERSITY OF DURHAM: FACULTY OF MEDICINE.—At the Convocation held on June 26th the following degrees were conferred:—

Doctor of Medicine.—William Hudson and Noel Florentine Rowstron.

Doctor of Medicine for Practitioners of 15 years' standing.—James Vere Arkle and Elgar Down.

Bachelor of Medicine and Bachelor of Surgery.—Percy Vernon Anderson, George Albert Clark, William Duncan, Ernest Craig Dunlop, Mortimer Jacob Hilton, Reginald Hunter, Charles Gordon Irwin, Harold Mason Leete, Phyllis Marriott, Freda Newman, Thomas Wilson Shaw, and Sadek Abdel Shehid.

The Diploma in Public Health was awarded to William Eric Roper Saunders.

At the Second Examination for the degree of Bachelor of Medicine the following candidates were successful:—

Anatomy and Physiology.—Tom Hugh Ronald Anderson, John Edmund Basham, Eric Cresswell Dagger, Kate Gray, B.A., Mary Louise Griffiths, Margaret Barbara Herbst, William Ewan Douglas Hodgson, Dorothy Holmes (second-class honours), Harold Holtby (second-class honours), Henry Norman Clarence Jaffé, Edith Catherine Morris Jones, Thomas Hobson Kirk, George McCoull, Maurice Myers, Thomas Swinhoe Severs, Joseph Silverston (second-class honours), Henry Rochester Smith, Alice Mary Stenhouse, James Stonehouse, Kathleen Mary Weldon Watts, Arthur Guy Weston, Edith Short Williamson, and Athelstan Woodman (first-class honours).

At the Third Examination for the degree of Bachelor of Medicine the following candidates were successful:—

Materia Medica, Pharmacology and Pharmacy; Public Health; Medical Jurisprudence; Pathology and Elementary Bacteriology.—Douglas George Patrick Bell (second-class honours), Dorothy Olga Sutherland Blair, Ernest Dewar Charles, William Devereux Forrest, Alexander Thomas Harrison, Patrick Hickey, Louis Lavine, Angus Hedley Whyte, and George Roebuck Woodhead.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH.—The following candidates passed the First Dental Examination:—

Daniel van der Merwe du Toit and Daniel Andries Marchand.

The following passed in the subject of Chemistry and Physics:—

Robert Mitchell du Preez and Thomas Bird Gregor.

The following passed the Final Examination and were granted the diploma L.D.S. R.C.S. Edin.:—

William Brownlee Watson and William Kerr, Edinburgh; Cayetano Bethencourt, Las Palmas, Canary Islands; and Andrew Francis Briglmen, Edinburgh.

METROPOLITAN HOSPITAL SUNDAY FUND.—The following are among the chief amounts received at the Mansion House to the end of last week:—

	£		£
Anon	2,000	St. Augustine's with St. Faith, E.C.	34

The total already available for distribution amounts to about £22,000.

THE MCQUITTY EXHIBITION.—The McQuitty Exhibition at the Royal Victoria Hospital, Belfast, for clinical work, has been awarded to Miss Georgina Thompson. The prize was founded as a memorial to the late Dr. W. B. McQuitty, a distinguished member of the medical staff.

THE TREATMENT OF CHOLERA IN CALCUTTA.—The official minutes of the Calcutta Corporation, recently received, record the arrangements made for the treatment of cases of cholera among the poor by medical inspectors of the Corporation, as follows:—

During the cholera epidemic of 1916 the health officer consulted Sir Leonard Rogers and reported that the modern treatment of cholera involves estimations of blood pressure, specific gravity of the blood, &c.; that the technique of intravenous saline injections under strict antiseptic precautions would be by no means easy, particularly in a hut; and that the risks from tetanus, air embolism, &c., in a dirty, dark hut would be too great to run. The matter was dropped for a time. Government has taken up the question of providing facilities for the treatment of cholera by the injection of hypertonic saline solution and is taking steps to arrange for instructions in this method of treatment being given to sub-assistant surgeons likely to be placed on cholera duty and to provide the necessary apparatus at the hospitals. Government believes that the number of medical men in Calcutta who are conversant with this system of treatment is at present small and that their charges are too heavy for the poorer classes to avail themselves of their services. Government has suggested that the Corporation should arrange on the outbreak of epidemics of cholera for the employment of a medical staff trained in this method, and having the necessary equipment for the treatment of the poor at their own homes. Government was informed of the apprehensions of the health officer; but it has consulted Sir Leonard Rogers, who approves of the proposal if properly trained men are employed, and has expressed readiness to give Corporation medical officers a practical training in his ward at the Medical College Hospital. In view of the advice given by Sir Leonard Rogers, Government has suggested that the experiment may be safely tried provided trained men are employed. The health officer has selected eight medical and vaccination inspectors, all possessing medical qualifications, though not L.M.S. or M.B., and the first batch is undergoing training, which will take about two or three weeks. The training has been arranged so as to cause as little dislocation of the ordinary work as possible. It is proposed to have at each of the district offices a set of the apparatus required for making the transfusion.

The Corporation received the report of their health officer with satisfaction.

CENTRAL MIDWIVES BOARD.—A meeting of the Central Midwives Board was held at Queen Anne's Gate Buildings, Westminster, on June 21st, with Sir Francis H. Champneys in the chair.—A letter was discussed from the general secretary of the Medical Defence Union asking the Board to consider certain communications of a more or less threatening nature received by several members of the Union from county medical officers of health as executive officers of the local supervising authorities in respect of professional attendance by recipients of the letters upon midwifery cases where uncertified women are engaged. The Board decided that the reply be that the Central Midwives Board has no jurisdiction over medical practitioners, uncertified women, or local supervising authorities. As regards the conduct of medical practitioners, the authority possessing jurisdiction is the General Medical Council. If reference is made to cases in which medical practitioners have been cited before it for "covering" uncertified women, it will be seen that a distinction is drawn by it between such women acting as monthly nurses and those acting as midwives. An uncertified woman who "habitually and for gain" attends women in childbirth otherwise than under the direction of a registered medical practitioner is liable, under the first section of the Act, to a fine not exceeding £10. Cases of genuine emergency are not included.—A letter was considered from the medical officer of the Lambeth Union Infirmary asking that his pupils may take one month's training out of the four required by Rule C. 1 (2) (*b*) in the gynæcological ward of the infirmary. The Board decided that the medical officer of the Lambeth Union Infirmary be informed that although the arrangements at that infirmary seem to the Board likely to prove of considerable value, the terms of the proviso of Rule C. 1 (2) apply to a candidate from a general hospital only and require a three months' course of nursing in a gynæcological ward in order to entitle the candidate to a reduction of one month in her midwifery training. The Board has consequently no power under this proviso nor under any other rule to grant the concession asked for.

ROYAL INSTITUTE OF PUBLIC HEALTH.—The Harben gold medal, which is awarded tri-annually, "for eminent services rendered to the public health," has this year been awarded to Surgeon-General Sir Alfred Keogh, G.C.B., Director-General, Army Medical Service, and the gold medal "for conspicuous services rendered to the cause of preventive medicine" to Dr. E. W. Hope, professor of public health in the University of Liverpool.

A Maternity Nursing Home at 13, Prince's-gate, London, S.W. 7, was opened by the Professional Classes War Relief Council early in 1915 for the benefit of the wives of professional men adversely affected by the war. Over 300 babies have been born therein. Applications for admission or for assistance in regard to maternity expenses at home should be made to the secretary. The work done has been most useful and is worthy of all support. Many medical men in various parts of the country have come across cases where the families of professional men have been terribly hit by the war, and in such circumstances this home has been a veritable blessing.

Major H. N. A. Taylor, R.A.M.C. (T.F.R.), has been called to the Bar by the Honourable Society of Gray's Inn.

THE SERVICES.

ARMY MEDICAL SERVICE.

Lieut.-Col. and Bt.-Col. E. M. Pilcher, D.S.O., to be temporary Colonel.

Col. C. R. Elliott and Col. (temp. Surg.-Gen.) M. William Russell, C.B., are retained on the Active List.

TERRITORIAL FORCE.

Lieut.-Col. A. R. Tweedie, Field Ambulance, to be temporary Colonel whilst holding the appointment of Assistant Director of Medical Services.

Capt. S. S. Greaves to be Deputy Assistant Director of Medical Services.

ROYAL ARMY MEDICAL CORPS.

Temp. Lieut.-Col. A. Primrose, Canadian A.M.C., to be temporary Colonel while employed as Consulting Surgeon.

Temp. Major R. S. Pentecost, Canadian A.M.C., to be temporary Lieutenant-Colonel while commanding a Canadian Field Ambulance.

Temp. Major H. J. Stiles (Captain, R.A.M.C., T.F.) to be temporary Lieutenant-Colonel.

To be temporary Majors: Lieut.-Col. H. A. Moffat, D.S.O., South African M.C., F. S. Langmead, A. Goodall, M. B. Wright, and Capt. A. W. Nuthall, R.A.M.C., T.F., Temp. Capt. R. T. Herron, and Temp Capt. G. S. Strathy, Canadian A.M.C., Temp. Capt. F. R. Seymour.

To be temporary Captains: F. W. Milne, S. W. Allworthy, D. W. Woodruff, H. Robinson (late Captain R.A.M.C., T.F.), C. K. Wallace, and G. B. Fergusson.

To be temporary Captains whilst employed with the Huddersfield War Hospital: A. E. Hardy and R. H. Rigby.

W. E. Bracey, late temporary Captain, to be Honorary Lieutenant.

To be temporary Lieutenants: J. D. Lyle, G. C. Birt, R. Ward, R. C. Walker, W. Bannatyne, P. Moran, G. H. Culverwell, J. J. Tough, W. M. Menzies, G. Stewart, L. D. Cohen, A. J. Ballantyne, A. McEwan, J. A. Thom, G. F. Shepherd, E. M. Condy, D. T. Harris, L. C. Newton, T. C. Pocock, L. W. Keigin, D. T. Evans, A. B. R. Sworn, J. E. Kesson, D. B. Davidson, P. Stewart, W. Matheson, J. R. Hewetson, G. Y. Caldwell, A. B. Vine, H. A. Cecil, H. F. Overend, J. N. G. Nolan, A. F. Cowan, J. M. Wallace, H. W. Latham, J. J. W. Evans, C. J. S. Dismorr, P. H. Henson, J. Sullivan, H. Matthews, G. Deery, W. F. Erskine, O. May, G. A. Hoffmann, R. Alderson, W. P. Miles, J. Lambie, H. F. Ransome, H. O'H. O'Neill, C. W. P. Hillary, D. W. Roy, W. Taylor, H. G. F. Spurrell, J. Rusk, M. Shipsey, S. E. Atkinson, J. Avery, H. V. Mitchell, W. B. Wilson, R. Stansfeld, P. W. Hampton, R. Crawford, K. McK. Duncan, J. Ritchie, W. Anderson, W. Lilico, W. B. Wickham, J. Hunter, J. F. Bridge, J. Wylie, S. D. Craig, L. Hutchinson, S. S. Prior, E. O D. Graham, R. Duncan, H. O. West, E. W. Witney, S. H. White, C. S. Thomson, G. H. C. Lumsden, A. E. Knapp, Q. Madge, O. V. Payne, G. W. Curtis, W. W. Allison, E. Tate, J. D. Ferguson, A. J. May, A. B. Sykes, A. C. Renton, R. H. Thomson, J. M. Ahern, F. G. Ralphs, W. H. F. Eales, F. J. Willans, J. A. Wood, C. W. Forsyth, J. H. Iles, T. J. Lloyd, T. Clarke, H. R. Wright, F. W. Pollard, V. G. Best, T. Gillespie, W. E. Waymark, J. Williamson, S. Wood, G. W. Pope, J. K. Holland, J. P. Doyle, G. C. F. Roe, J. A. MacSweeny, A. R. Soady, R. E. G. Gray, J. M. Taylor, A. E. Leapingwell, H. T. P. Young, H. M. Roberts, J. P. Brennan, W. S. Sheppard, J. F. Peart, E. R. D. Maconochie, S. Brown, A. W. Brodribb, W. Weir, J. B. Aickin, J. A. Mearns, W. Mair, J. Steward, G. A. Pratt, A. H. B. Hartford, G. N. Kirkwood, R. Peart, W. W. Carlow, P. Talbot, J. C. Wootton, A. W. Ewing, W. Rotheram, A. Evans, A. C. Russell, J. Wilson, C. M. Ockwell, R. H. Hunter, J. Dunbar, T. R. Davey, T. P. Robertson, M. J. McCarthy, L. Welply, F. H. Fuller, N. E. Sampey, J. I. F. Knight, C. B. Ticehurst, F. W. MacKichan, R. Brown, D. MacGregor, J. Scott, F. H. Dodd, C. M. Ormsby, J. H. Jones, A. S. Mellor, C. L. Traylen, C. Murray, D. P. Lindsay, L. H. Werden, N. Gray, J. S. Wilson, C. L. Driscoll, H. E. Davison, A. H. Collins, E. E. Paget-Tomlinson, G. C. Anderson, G. Cooper, M. Briscoe, H. Graham, H. W. Horan, R. G. Smith, P. D. Hunter, S. A. Furlong, B. J. Cusack, E. A. Sanders, J. J. Delany, G. G. C. Adams, J. R. Munro, R. J. W. McKane, J. Ferguson, H. N. K. Kevin, D. D. Ritchie, R. J. Bentley, S. H. Sweet, H. Spurway, A. I. Shepherd-Walwyn, G. E. Thornton, W. S. Graham, I. L. MacInnes, J. K. Manson, J. Dalgliesh, J. L. Maynell, E. M. Niall, S. B. White, J. L. Reid, W. Tregea, W. B. Clarke, S. N. Galbraith, H. F. Fenton.

Officers relinquishing their commissions: Temp. Lieut.-Col. A. H. Carter (on account of ill-health); Temp Capts. C. T. Hilton, L. E. Williams, W. S. Newton, H. N. M. Puckle, H. C. Nelson, H. R. Smith, H. C. Martin, P. M. O'Sullivan, H. McKenzie, G. S. Cronk, L. A. Carr, W. L. Pedlow, F. W. Overholt, D. A. Macfarlane, J. V. Williams, C. F. W. Robinson, and E. Caudwell (on account of ill-health); Temp. Lieut. W. M. Thomas.

SPECIAL RESERVE OF OFFICERS.

To be Lieutenants: K. Masson, J. A. Martin, N. M. Lewis.

TERRITORIAL FORCE.

Capts. (temp. Majors) F. W. K. Tough, L. C. V. Hardwicke, P. W. Thompson, and J. O'Sullivan relinquish their temporary rank on ceasing to command a Field Ambulance.

Capt. S. S. Greaves is seconded whilst holding the appointment of Deputy Assistant Director of Medical Services.

Capt (temp. Major) S. G. Webb relinquishes his temporary rank on alteration on posting.

Ian Ewart Macdonald to be Lieutenant.

Capt. (temp. Major) C. G. K. Sharp relinquishes his temporary rank on alteration in posting.

Major (temp. Lieut.-Col.) J. Bruce relinquishes his temporary rank on alteration in posting.

Lieut.-Col. A. R. Tweedie is seconded whilst holding an appointment as an Assistant Director of Medical Services.

Capt. (temp. Major) D. M. Spring relinquishes his temporary rank on alteration in posting.

Majors (temp. Lieut.-Cols.) H. Jones, H. A. Rudyard, A. W. Anderson, W. Bryce, J. H. Jones, J. Evans, C. W. Edwards, J. R. Benson, D. C. L. Orton, and Capts. (temp. Majors) J. Arthur, C. Cameron, G. H. Spencer, C. G. Murray relinquish their temporary rank on alteration in posting.

Capt. J. N. Robins is restored to the establishment on vacating the appointment of Deputy Assistant Director of Medical Services.

Capt. (acting Lieut.-Col.) J. W. Keay reverts to the temporary rank of Major on alteration in posting.

Capt. J. Blackwood to be acting Lieutenant Colonel whilst commanding a Field Ambulance.

Cyril Montague Smith to be Lieutenant.

Capt. (temp. Major) R. B. Carslaw is seconded for duty with a General Hospital, and to retain his temporary rank whilst so employed.

Capt. E. M. Jenkins to be temporary Major whilst in command of a Field Ambulance.

Capt. (acting Lieut.-Col.) R. A. Broderick relinquishes his acting rank on ceasing to command a Field Ambulance.

W. D. Dick to be Lieutenant.

Surgeon-Major J. E. Bates, from East Surrey Regiment, to be Major.

Officers seconded for duty with a General Hospital: Lieut.-Cols. T. Gowans, J. F. Dobson, G. P. Bush, C.M.G.; Majors H. B. Roderick, A. Cook, F. W. Burton-Fanning, R. A. Veale, D. J. Graham, F. D. Boyd, C.M.G., J. A. Andrews; Capts. W. B. Marshall, W. Tyson, H. A. Cookson, M. G. Foster, C. N. Chadborn, W. E. Alderson, T. S. P. Parkinson, J. D. Lickley, W. Seymour, A. Gough, W. Longley, F. J. Stansfield, M. J. Stewart, T. B. Mouat, J. H. Cobb, A. Young, H. C. Snell, W. R. Higgins, C. W. Sharpley, R. H. Fagge, R. Michell, A. A. S. Skirving, J. Eason, J. McC. Johnston, J. Gilchrist, J. Henderson, S. G. Webb, H. B. Whitehouse, A. R. Bearn, J. G. L. Mackay, A. L. Flemming, and W. B. Secretan.

INDIAN MEDICAL SERVICE.

The King has approved of the retirement of Colonel D. St. J. D. Grant.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Military Service (Review of Exceptions) Act.

THE Select Committee of the House of Commons which has been appointed to inquire into the working of the Military Service (Review of Exceptions) Act, commenced taking evidence on Monday, July 2nd. Mr. SHORTT was in the chair. It is understood that the aim of the Committee is to be in a position to report to the House in the early days of August, and for that purpose the intention is to sit four days a week. A very considerable body of evidence on behalf of men who have come under the operation of the Act has been offered to the Committee.

Brigadier-General CAMPBELL GEDDES, Director of Recruiting, was the first witness on Monday, and he described the necessity which, in the opinion of the War Office, existed for introducing a review of the exceptions from military service. He went on to say that a special branch had been created at headquarters under Colonel GALLOWAY, the senior physician at Charing Cross Hospital, for carrying out the arrangements of the Medical Boards throughout the country. Colonel GALLOWAY had inspected these arrangements and had advised their members as to the standards of fitness which should be applied to the men who came up for medical examination. The result had been that a much more uniform standard had been attained and very few men were now called up for the Army who were unsuitable for the work which was allotted to them. He was prepared to anticipate a 1 per cent. of error, but included in it there would be cases of impersonation. The War Office, he mentioned, had several definite cases where after a man had been classified by a medical board it happened that a hopelessly unfit man would report in his stead on the issue of the calling up notice. There had been a good deal of "doping," and for that reason re-examination became necessary. As to certificates given to men by private medical practitioners, he said that they had been valuable guides to medical boards in many cases, but the difficulty sometimes had been the absence of means of knowing that the man to whom the private certificate related was the man before the board. The witness also pointed out that the Army was in need of men of the lower categories. There was no more chance of a man classified as C 3 seeing service in the trenches than if he remained in civilian employment.

Sir A. Keogh's Evidence.

On Tuesday, July 3rd, Sir ALFRED KEOGH, the Director-General of the Army Medical Service, was the witness. He made a statement showing the functions which were exercised by his department. He said that it was not until the time of the Derby campaign that it was possible to establish a fully organised system for the medical examination of recruits. At that time he had suggested that medical boards should be set up for the examinations. In order to secure that these boards should have Army experience to guide them, it had been considered that where possible a military medical officer should be appointed president. All the medical boards had to do was to report as to the physical condition of the men put before them, and there was ample room for difference of opinion as to what category the man should be placed in. Medicine was not an exact science. It was for this reason that boards were established in order that decisions of great importance should not be made on the opinion of one practitioner. He emphasised the special character of the work of passing men for the Army. It involved a knowledge of the daily life of the soldier. In peace time a man was recruited for a special branch, and it was necessary for the examining medical officer to know something about the daily life of the soldier in that branch. Although the physical standards for the service were the same, the amount of weight to be laid on any specific disability depended on the branch of the service for which the man was accepted. When the war broke out men were taken to local practitioners for medical examination. These practitioners could not possibly know the requirements of the service, and the consequence was that a large number of men were recruited who in peace time would not have been accepted. Errors arose from the want of knowledge of the Army, and many of the differences of opinion which had been found to exist were quite legitimate differences as between medical men. Very good medical men might well differ as to the category in which a man should be placed. Sir ALFRED KEOGH went on to say that the best recruiting medical officer could not possibly examine more than 40 recruits a day without doing injustice to himself and the service. He had appointed a body of medical inspectors to try to obtain common standards. The president of a medical board could not override the opinion of

three or four other members. He did not appoint the civilian medical boards. That was done by the various commands. He would furnish particulars which would show the number of men who had been in hospital with less than three months' service, but he could not give the number of men who had been previously rejected before being accepted by the Army.

Mr. COCHRANE: It is not possible for men to be classified by the president of the board alone?

Sir A. KEOGH: Most emphatically it would be quite contrary to the custom of the service. He did not think that there had been a general lowering of the standards. The medical department did not fix standards, but interpreted standards. The military authorities told that department what they required the men to do, and the medical men tried to translate that into physical terms. The responsibility for the medical boards was on the deputy directors of medical service in the commands. The recruiting officers were responsible for summoning men to undergo medical examinations.

Evidence of Colonel James Galloway.

Colonel JAMES GALLOWAY gave evidence on Wednesday, July 4th. He stated that before assuming his present duties as inspector of medical recruiting boards he had spent considerable time as consulting physician to the First and Second Armies in France. He was senior physician in Charing Cross Hospital. In his visits of inspection he had visited nearly all the medical recruiting boards in the country. Some 139 or 140 recruiting medical boards were now at work in England, Scotland, and Wales. These varied in efficiency within wide limits. They were of various types. Perhaps the best of these boards were those which centred round a retired R.A.M.C. officer. These established themselves at the depôts of the various regiments, and where there was an officer who had retired young, say with the rank of major, and had identified himself with the civilian population, the board which formed round him was generally very efficient. Other boards had arisen more rapidly. For instance, the D.D.M.S. of a command, knowing he had to establish a board, would chose some officer and send him to establish it on his own initiative. The best boards of this type were chosen in collaboration with the local medical profession, and he thought it advantageous to act in coöperation with the Local Medical War Committees in the formation of boards. There was still another sort of board which he had come across, particularly in the Eastern Command. The president and the examining officers seemed to be military men, but on inquiry he often found that the majority of them were Territorial medical officers or civilian medical men holding temporary commissions. Colonel GALLOWAY spoke of the extreme difficulty experienced in many instances in obtaining suitable accommodation for the boards, and also of the composition of the boards themselves. A president and four members was the most suitable size. A good president was very important. He required training and a great deal of tact and prudence and a certain capacity for organisation. It was thought desirable that on the whole the president should be an officer who knew from experience what the soldiers had to do in the field. In his own view it was the better plan to get as presidents of the boards men who had Army experience, but were not too far removed from the medical profession so far as years and experience were concerned, and were able to know the requirements of the forms and were able to keep a certain amount of discipline and order in the proceedings of the board. The members of the boards were preponderatingly civilian practitioners. They were often the local doctors. In certain commands, where the president was in contact with the Local Medical War Committee, a panel of local practitioners was arranged. It was most essential that the president should not be working in his own locality. Colonel GALLOWAY spoke of the difficulty in placing men in the different categories. The margin between one class and another was often very narrow and there was room for legitimate disagreement. What had struck him during his inspection had been not numerous mistakes but the organisations which had grown up in such a short time and the general competency of the work performed by the boards. He had heard of certificates being torn up, but he had never seen anything of the sort himself. The certificate of a family doctor might be much more helpful to a board than even the certificate of a specialist who had examined a man.

The Committee adjourned.

Mesopotamia Commission.

It has been arranged that a day will be devoted by the House of Commons next week to a discussion of the Mesopotamia Commission's report. In the meantime a good many questions have been asked about it, but Ministers have been inclined to request Members to await a debate. On Wednesday, July 4th, both the Chancellor of the Exchequer and the Secretary of State for India declined to assent to the publication of the evidence taken before the Commission.

Lord HARDINGE OF PENHURST who occupied the position of Viceroy during the events of Mesopotamia covered by the report, has made a long statement on his position in the House of Lords. He made some references to the medical arrangements, and stated that he and the Commander-in-Chief in view of the rumours which reached them decided on the appointment of the Vincent-Bingley Commission. He remarked that the heavy demands made on India for the provision of ambulances and hospitals and their personnel in England, France, Mesopotamia, Egypt, and East Africa soon exhausted an organisation which had never been intended or prepared for operations out of India, and he pointed out that his telegram of Oct. 21st, 1914, a date within three months of the outbreak of war, indicated that the supply of hospital assistants and permanent hospital staffs had already been exhausted, but that every effort was being made to improvise new personnel. By making a great effort many more ambulances, hospitals, and medical personnel were despatched from India to the various theatres of war during the course of 1915. He pointed out that even before the despatch of the Vincent-Bingley Mission he took every possible means to improve the medical situation. It might be difficult for people in England to realise the inherent difficulties in the personal supervision by the Viceroy over the medical arrangements in a theatre of war so far distant from him as Mesopotamia was from India.

HOUSE OF COMMONS.

WEDNESDAY, JUNE 27TH.

Infant and Maternity Welfare in Ireland.

Answering Mr. BYRNE, Mr. DUKE (Chief Secretary for Ireland) said: The Government proposals in regard to maternity and child welfare were communicated to the county, borough, and urban district councils and made public in June last year, and to rural district councils last month.

THURSDAY, JUNE 28TH.

Prisoners of War.

Replying to questions relating to the negotiations by British and German delegates at The Hague in respect to questions connected with the treatment of prisoners of war, Mr. BONAR LAW (the Chancellor of the Exchequer) said: The British delegates are only empowered to discuss questions relating to prisoners of war. These include the resumption of the repatriation of combatant and civilian prisoners under existing agreements; the extension of the existing agreements for the repatriation of combatant and civilian prisoners; the transfer of combatant prisoners of war to other neutral countries in addition to Switzerland; the internment of civilian prisoners of war in neutral countries; the more expeditious and satisfactory delivery of parcels to prisoners; the punishment of prisoners; reprisals on prisoners; the delay in reporting and failure to report the capture of prisoners; and the removal of British merchant officers from combatant officers' camps. The British delegates are not debarred from discussing other questions relative to prisoners of war which may be raised by the German delegates, but, in any case, such conclusions as may be arrived at will be subject to ratification by His Majesty's Government.

The Traffic in Morphine.

Sir WILLIAM COLLINS asked the Home Secretary whether Regulation 40 B in the Order of Council, No. 501, of July 28th, 1916, which restricted the traffic in opium and cocaine to that required for medicinal purposes applied also to morphine, the principal alkaloid of opium; and, if not, whether, in view of the abuse to which that drug was liable, he would bring to the notice of the Privy Council the desirability of extending the Order so as to include morphine, its salts and preparations.—Sir G. CAVE replied: Regulation 40 B does not apply to morphine. The Regulation is an emergency provision made under the powers of the Defence of the Realm Act, and I am not at present aware of any special grounds arising out of the present emergency for exercising those powers in regard to morphine. The inclusion of opium in the Regulation was necessary in order to put a stop to the illicit export of opium in contravention of the Proclamation.

Sir WILLIAM COLLINS asked the Foreign Secretary whether any communications had taken place with the Japanese Government in reference to the imports of morphine of British manufacture entering Japan and passing thence into China; and whether, seeing that Japan, China, and Great Britain were signatories to the International Opium Convention of 1912, which included morphia, steps would be taken with a view to restrict the traffic in that drug to legitimate and medical purposes only as provided in the convention.—Mr. BALFOUR wrote in reply: His Majesty's Ambassador at Tokio has been consulted in this matter, but the Japanese Government has not yet been actually approached. The other departments concerned are at present considering what steps can properly be taken to restrict the traffic in morphine.

An Amendment of National Insurance Acts.

Mr. TYSON WILSON asked the representative of the National Insurance Commissioners whether he proposed to bring in a Bill to amend the National Insurance Acts on the lines recommended by the Ryan Committee.—Sir E. CORNWALL replied: The matter is now under consideration, and I hope it will be possible to introduce at an early date an amending Bill of a non-controversial nature.

Health of Munition Workers.

In the course of a comprehensive speech dealing with the activities of the Munitions Department Dr. ADDISON (Minister of Munitions) said: We have received much help from the branches of the Ministry which have special charge of the welfare and health of munition workers. The Health of Munition Workers Committee, under Sir George Newman, has helped us a great deal in this matter. I should hope that some of the reports which it has published and we have adopted will lead to a permanent improvement in our methods of industry. More than 600 firms have appointed supervisors whose sole duty is to promote the welfare of their workers, and great benefit has resulted in different directions. They deal with such questions as food, clothing, light, ventilation, rest, and so forth. I am sorry to say that last year the problems arising out of the handling of T.N.T. and other poisonous explosives became acute and I appointed a special committee, under the chairmanship of Dr. W. M. Fletcher, secretary of the Medical Research Committee, to investigate them and make recommendations. The efforts of this committee, in conjunction with the filling department, have resulted in the application of suggestions which have been accompanied by an enormous diminution of the cases of illness. We have found here, as we have found often enough before, that the problems of prevention, when understood, are easier than those of cure.

TUESDAY, JULY 3RD.

Funds for Treatment of Tuberculosis.

Sir G. GREENWOOD asked the representative of the National Insurance Commissioners whether he was aware that the funds in the hands of the Commissioners were hardly sufficient to enable them to meet the just claims upon them; whether it was anticipated that by reason of the war those claims would be very largely increased; and whether, in these circumstances, he would consider the desirability of applying the moneys provided by Parliament primarily for the purpose of defraying the expenses of sanatorium benefit, under Section 16 of the National Insurance Act, 1911, for such purpose in preference to expending them on painful experiments upon living animals.—Sir E. CORNWALL replied: I am aware that funds available for the treatment of tuberculosis in this country need to be increased and that by reason of the war this need has become more urgent, but I have no doubt that whatever provision is made for this purpose, Parliament would require that provision should also be made for continuing the essential work carried on by the Medical Research Committee in the interest of the health of the community.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.

To be Certifying Surgeons under the Factory and Workshop Acts: BREW, R. V. (Chew Magna District of the county of Somerset); KHAMBATTA, J. C., M.B., Ch.B. Edin. (East Wemyss District of the county of Fife); WHITWORTH, W. C., M.R.C.S., L.R.C.P. Lond. (St. Agnes District of the county of Cornwall).

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

ABERGAVENNY, MONMOUTH COUNTY ASYLUM.—Temporary Assistant Medical Officer. Salary £7 7*s.* per week, with board, &c.

BARNSLEY, BECKETT HOSPITAL AND DISPENSARY.—House Surgeon. Salary £250 per annum, with board, &c.

BIRKENHEAD BOROUGH HOSPITAL.—House Surgeon. Salary £250 per annum and war bonus, board, &c.

BOURNEMOUTH, ROYAL NATIONAL SANATORIUM FOR CONSUMPTION AND DISEASES OF THE CHEST.—Resident Medical Officer and Clinical Tuberculosis Officer. Salary for joint appointments £430, with board, &c.

BOURNEMOUTH, ROYAL VICTORIA AND WEST HANTS HOSPITAL, Boscombe Branch.—Resident Medical Officer. Salary £300 per annum, with board, &c.

BRISTOL ROYAL INFIRMARY.—House Physician and House Surgeon. Salary at rate of £120 per annum, with board, &c.

BURTON-ON-TRENT INFIRMARY.—Resident House Surgeon. Salary £250 per annum, with board, &c.

CHILDREN'S INFIRMARY, Cleveland-street, London, W.—Assistant Medical Officer. Salary £250 per annum, with board, &c.

DEVONPORT, ROYAL ALBERT HOSPITAL.—House Surgeon, unmarried. Salary £150 per annum, with board, &c.

DIDWORTHY, S. BRENT, DEVON AND CORNWALL SANATORIUM FOR CONSUMPTIVES.—Locum Tenens for four weeks. 6 guineas per week, hospitality, &c.

DURHAM COUNTY COUNCIL.—Female Assistant School Medical Officer. Salary £300 per annum, &c.

GRANGE-OVER-SANDS, WESTMORLAND SANATORIUM AND HOME.—Locum Tenens Assistant Medical Officer for three weeks. Salary 7 guineas per week, with board, &c.

GREENWICH UNION INFIRMARY AND WORKHOUSE.—Assistant Medical Officer, unmarried. Salary £200 per annum, with apartments, rations, &c.

INSURANCE COMMITTEE FOR THE COUNTY OF LONDON.—Medical Adviser.

ITALIAN HOSPITAL, Queen-square, London, W.C.—House Surgeon for six months. Salary £150 per annum, with board, &c.

LIVERPOOL EYE AND EAR INFIRMARY, Myrtle-street.—Female House Surgeon.

LIVERPOOL ROYAL INFIRMARY.—Male and Female Clinical Assistant for Treatment of Venereal Diseases. Male Assistant two hours three days a week. Female Assistant one day a week. Salaries £250 for Male and £100 for Female Officer.

MACCLESFIELD GENERAL INFIRMARY.—House Surgeon. Salary £200 per annum, with board, &c.

MANCHESTER CHILDREN'S HOSPITAL, Pendlebury, near Manchester.—Two Female Resident Medical Officers, unmarried. Salary at rate of £200 per annum.

MANCHESTER COUNTY ASYLUM, Prestwich.—Locum Tenens. Salary £7 7*s.* per week, with board, &c.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL, Marylebone-road, N.W.—Assistant Resident Medical Officer for four months. Salary at rate of £60 per annum, with board, &c.

QUEEN MARY'S HOSPITAL FOR THE EAST END.—House Surgeon.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, E.—House Physician for six months. Salary £100 per annum, with board, &c.

ROYAL FREE HOSPITAL, Gray's Inn-road, W.C.—House Physicians. Salary £50 per annum, with board, &c.

SHEFFIELD ROYAL INFIRMARY.—House Physician. Salary £120 per annum, with board, &c.

SOUTH LONDON HOSPITAL FOR WOMEN, South Side, Clapham Common, S.W.—Female House Physician and House Surgeon for six months. Salary at rate of £100 per annum each, with board, &c.

STAFFORDSHIRE, WOLVERHAMPTON, AND DUDLEY JOINT COMMITTEE FOR TUBERCULOSIS.—Holiday Locum Tenens. Salary 8 guineas per week.

STOKE-ON-TRENT COUNTY BOROUGH.—Female Assistant Medical Officer, in connexion with Maternity and Child Welfare Work, &c. Salary £350 per annum.

SUNDERLAND COUNTY BOROUGH.—Temporary Tuberculosis Medical Officer. Salary at rate of £500 per annum.

THROAT HOSPITAL, Golden-square, W.—Two Resident House Surgeons. Salaries £100 per annum, with board, &c.

WALSALL EDUCATION COMMITTEE.—Temporary School Medical Inspector. Salary at rate of £400 per annum.

WEST HAM UNION INFIRMARY, Whipps Cross-road, Leytonstone, E.—Resident Assistant Medical Officer. Salary £300 per annum, &c.

WOLVERHAMPTON AND MIDLAND COUNTIES EYE INFIRMARY.—House Surgeon. Salary £150 per annum, with board, &c.

YORK, CITY OF.—Temporary Tuberculosis Officer. Salary at rate of £500 per annum.

Births, Marriages, and Deaths.

BIRTHS.

JONES.—On July 2nd, at Coleford House, near Bath, the wife of Captain Philip T. Jones, R.A.M.C., T.F.R., of a daughter.

MARRIAGES.

ALEXANDER-MORGAN.—On June 27th, at Stockton Heath Parish Church, Cheshire, by the Rev. H. V. Pigot and Rev. J. Collins, Richard Charles Alexander, M.B., F.R.C.S.E., temporary Captain, R.A.M.C., to Marjorie Linda Morgan, third daughter of W. Arthur Morgan, of Cork-street, London, W., and Cardiff.

DICKENSON—GOSTLING.—At St. Olave's Church, Staff-Surgeon G. O. M. Dickenson, M.B., R.N., to Mary Ella, elder daughter of Dr. J. H. and Mrs. Gostling, Bootham, York.

RICHES—RIDER.—On June 25th, at St. Mary's Church, Felpham, Major R. G. Riches, R.A.M.C., to Nellie Grace, daughter of William C. Rider and Mrs. Rider, of Felpham, Sussex.

DEATHS.

BIRDWOOD.—On June 28th, at Windsor-road, Ealing, George Christopher Molesworth Birdwood, K.C.I.E., C.S.I., M.D., aged 86.

BROWNE.—On June 27th, at Kirby View, Caldy, Edgar Athelstane Browne, F.R.C.S. Edin., M.Ch. Liverpool, aged 75 years. Formerly of Rodney-street, Liverpool.

COTTON.—On June 28th, at his residence, Highland House, Camden-road, N., Thomas Cotton, M.D., M.R.C.S., L.R.C.P., aged 80. No flowers, by request.

PIGGOTT.—On June 26th, suddenly, at Sutton Veny, Frederick Cecil Holman Piggott, M.D. Cantab., temporary Captain, R.A.M.C., of Teign Royd, Teignmouth, aged 57.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

EGYPTIAN REMEDIES FOR BITES AND STINGS.

AN important relic from ancient Egypt throwing light upon the medical knowledge of primitive times is the inscribed slab known as the Metternich Stele. It gives magic formulæ protective against bites of venomous animals, and, in case the injury had been suffered, remedial incantations and medical means of cure or alleviation. In Egypt medicine and magic were closely connected, being studied jointly in a college and clinic called "The Double House of Life." Of its curriculum we have some particulars in an inscription now in Rome. The medical measures for use in the case of bite or sting were as follows:—

> The person bitten, if unconscious, was examined, and if the wound's site was uncertain the body was smelt over. It would seem that the scent of the breath was indicative of the type of reptile inflicting the injury. Once the puncture was located the surgeon sucked the wound, spitting away any matter withdrawn. This process is frequently advised, and as blood is alluded to in all of them it evidently was the practice to make an incision near the puncture to abstract venom commencing to invade the arteries. If the sting was upon a compressible member, that was tightly compressed by the fingers and massage applied with the view of squeezing out the poison. Ligatures were employed to stop the circulation and retard infection. These were of a special kind, of which the physician had a supply, it being important they should be inscribed with magic formulæ. Bandages had such texts upon them, or upon labels attached. One remedy mentioned is a mixture of flour and salt. If the contagion had produced coma, the patient was violently shaken, and various means tried to awaken him. These included mesmeric passes and incantations, which were reported to have been successful when Isis cured Horus from the bite of the animal evil deity, Set.

It will be seen that the medical measures used did not amount to much. No antidote of any efficiency is advised. Therefore the interest of this inscription lies in its evidence of the meagreness of medical knowledge at the time when it was originally written. This may be very far back indeed, for it professes to be a copy of a very ancient and almost perished text found in a temple.

The intimate connexions between Egyptian magic and medicine are demonstrated by the dual title of physician and magician being assigned to the same person. The ancient hieroglyphs, or pictographs, for physician are very significant, being a seated man apparently with shaven head as became a member of some religious association; a pot or vase; and a barbed arrow; also a small vertical line. The jar evidently denoted the receptacle for drugs or salves, whilst the dart signified the poignant pain the medicine-man relieved, or a wound to be healed.

THE CHILDREN'S COUNTRY HOLIDAY FUND AND EAST-END AIR-RAIDS.

WHILE the immediate effects of air-raids are obvious the remote effects on the mind and body of the child must not be lost sight of. The suggestion that as many children as possible from North Street school area, Poplar, the school which suffered most severely in the East-End raids, should be sent away to the peace and quiet of the country has much to commend it. The Children's Country Holiday Fund is appealing for donations to this end and at the same time asking residents in the western counties within 150 miles of London, who may be in a position to secure suitable cottage accommodation, to communicate with the secretary at 18, Buckingham-street, Strand, W.C. 2.

A HIGH-FREQUENCY GENERATOR.

THE Sterling Corporation, Ltd., of 72, Wigmore-street, have shown us a form of high-frequency generator that has some obvious advantages. Though weighing only 5 lb., it is quite capable of giving all forms of high frequency in applications for local conditions, as distinguished from diathermy. As these local applications constitute the chief value of the high-frequency apparatus, weighing ordinarily almost as many hundredweights as this apparatus weighs in pounds, it will be seen that we have here a great technical advance on the apparatus hitherto available. Furthermore, the apparatus can be used in the patient's house with any current and any voltage as usually supplied. Where no main current is available a special form is supplied to work from batteries. A very complete series of vacuum and other electrodes are obtainable, and these, as well as the apparatus itself, are sold at a reasonable price. The vendors make some claim for the apparatus that it is a violet and ultra-violet ray generator and possesses special advantages on this account. We venture to doubt if these claims can be substantiated in practice, and they are unnecessary, seeing that without them the apparatus is well worthy of the attention of those interested in ordinary applications of high-frequency electricity.

Medical Diary for the ensuing Week.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye. Dr. Simson: Diseases of Women.

TUESDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

THURSDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye.

FRIDAY.—10 A.M., Dr. Simson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Eye Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

ROYAL INSTITUTE OF PUBLIC HEALTH, Lecture Hall of the Institute, 37, Russell-square, W.C. 1.

Course of Lectures and Discussions on Public Health Problems under War and After-war Conditions:—

WEDNESDAY.—4 P.M., Lecture XIII.:—Prof. D. N. Paton: Feeding a Nation. Followed by a discussion.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.*

Offices: 423, STRAND, LONDON, W.C. 2.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C. 2, are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

SUBSCRIPTION RATES.

INLAND.

TRADE MARK
A.D. 1715

Bynin Amara

TRADE MARK

FORMULA :

Quinine Phosphate	**1½ grains.**
Iron Phosphate	**2 „**
Nux Vomica Alkaloids (equal to Strychnine)	**1/16 grain.**
"Bynin," Liquid Malt	**1 ounce.**

"A distinct advance on Easton's Syrup"

THE LANCET.

"Bynin" Amara

is an analogue of Easton's Syrup, over which it has, however, marked advantages. In this product, "Bynin," a pure, nutritious, and highly active Liquid Malt, supersedes the inert basis of the official preparation.

"Bynin" Amara

is vastly superior to Easton's Syrup; the dose can be regulated with exactness; the digestive organs are reinforced and the system is invigorated by its powerful tonic action. It not only assists the digestion of food, but conserves and ensures complete assimilation.

Explanatory Pamphlet and Sample Free to Medical Men.

Allen & Hanburys Ltd.,
Lombard St., London.

Niagara Falls, N.Y. Toronto. Buenos Aires. Durban. Sydney.

[See also pages 24 & 25.

LISTERINE

the well-proven and time-tried antiseptic solution, has been prescribed by the Medical Profession with very satisfactory results for 35 years in the treatment of Respiratory Diseases incident to Fall and Winter climatic conditions.

LISTERINE

one part, hot water three parts, is a useful gargle for sore throat. In mucous catarrhs, Listerine, suitably diluted, is most effectively applied by means of the spray apparatus or douche.

LISTERINE

is not only a vehicle for specially indicated alteratives, resolvents and astringents, but is itself an efficient, non-irritating antiseptic, that is safe, pleasing to the taste, and promptly effective.

A Treatise on Respiratory Diseases will be forwarded to Members of the Medical Profession on request.

LAMBERT PHARMACAL COMPANY, Twenty-First and Locust Streets, St. Louis, Mo.

British Agents: S. MAW, SON & SONS, 7, Aldersgate Street, London, E.C.

Antikamnia Tablets

Strongly Recommended in:

INFLUENZA & LA GRIPPE

For the headache, pain, and general soreness give a five-grain Antikamnia Tablet crushed with a little water; if the pain is very severe two tablets should be given. Repeat every 2 or 3 hours as required. One single ten-grain dose is often followed by complete relief.

NEURALGIA

In the Treatment of Neuralgia and Myalgic Pains Antikamnia Tablets are not only palliative, but, along with other measures, assist in ultimate cures; they also have a field of use in Rheumatic and Gouty Affections. In Neurasthenia, Hysteria, and Migraine they are a valuable adjuvant to the other recognised therapeutic measures.

LARYNGEAL COUGH

Frequently remains after an attack of La Grippe, and has been found stubborn to yield to treatment. There is an irritation of the larynx, huskiness, and a dry and wheezing cough, usually worse at night. The prolonged and intense paroxysms of coughing are controlled by **ANTIKAMNIA & CODEINE TABLETS**, and with the cessation of the coughing the laryngeal irritation subsides.
Antikamnia Tablets are the least depressing of all the drugs that can exercise so extensive a control of pain, and also least disturbing to the digestive and other organic functions.

Analgesic. Antipyretic. Anodyne.

Antikamnia Preparations in 1-oz. packages only.

JOHN MORGAN RICHARDS & SONS Ltd.,

46-47, Holborn Viaduct, LONDON.

An Ideal Antiseptic

of wide applicability in the treatment of infected wounds and in surgical practice.

CHLORAMINE-T

p-toluene-sodium-sulphochloramide.

Introduced by Dr. H. D. Dakin and his colleagues of the Leeds University.

The use of the Hypochlorite antiseptics marks a new era in treatment. The new product—CHLORAMINE-T—is a great advance on the solutions containing Hypochlorous Acid which are now so widely used. It is practically non-toxic, does not coagulate blood serum, and is stable both in powder and solution. It may be employed not only for the treatment of wounds, but also as a mouth wash, nasal or vaginal douche, and for urethral irrigation.

Supplied in Powder in 1oz. bottles 1/2; 4oz. 3/6; 1lb. 12/6. Also in Tablets—8·75 grs.—bottles of 25, 1/4; 50, 2/6; 100, 4/6. Tablets—43·75 grs.—bottles of 12, 2/8; for making solutions of known strength. All post free.

Chloramine-T Gauze

containing approximately 5% Chloramine-T is also prepared. It is a non-toxic and non-irritating antiseptic gauze, and should be used dry, and subsequently moistened (if necessary) when in position.

Supplied in Rolls, 1/- each, post free.

May be ordered from any of the 555 branches of Boots *The* Chemists or direct from Headquarters.

Manufactured in the Laboratories of

BOOTS PURE DRUG CO. LTD.,

STATION STREET, NOTTINGHAM.

GOUT & RHEUMATISM

¶ BETUL-OL rapidly penetrates the skin, producing anodyne effects and local antiseptic action at the seat of inflammatory rheumatic, gouty, neuralgic, or sciatic pain.

¶ BETUL-OL is a solution of menthol and chloral in methyl salicylate, soluble in all proportions of ether, alcohol, chloroform, or oils. After application of BETUL-OL a wet piece of tissue paper produces physico-chemical action, hyperemia and rapid relief of local pain.

Original Bottles of 2-oz., 4-oz., 8-oz., 16-oz.

¶ COLCHI-SAL promotes normal metabolism and removes the underlying cause in rheumatic and gouty diathesis.

¶ Each capsule of 20 centigrams contains: 1/4 milligram (1.250 gr.) of colchicine, 1/8 milligram active principle of canabis indica dissolved in methyl salicylate *(from betula lenta)* with appropriate adjuvants to ensure toleration by the stomach.

Original Bottles of 50 and 100 Capsules.

Free samples from

THE ANGLO-AMERICAN PHARMACEUTICAL Co., Ltd.
Croydon, London.

Emol-Keleet

The Natural Sedative Emollient Dusting Powder

After vaccination, dusting the vesicles with **Emol-Keleet** will be found to have a mildly astringent action and to considerably alleviate the local irritation. Owing to its purely inorganic composition and its extremely fine, impalpable texture, it may be recommended with advantage for regular application.

Emol-Keleet has a very beneficial effect in all cases of inflamed and irritated conditions of the skin. It is especially indicated in the treatment of epidermic irritation accompanying scarlet fever and measles, and its absorbent and sedative properties make it particularly beneficial in purulent eczema and inflammatory papulæ.

Samples Free to the Medical Profession on Request.

FASSETT & JOHNSON, LTD.
86, Clerkenwell Road, London, E.C.

Battley's Solution of Opium.

Liquor Opii Sedativus

(BATTLEY)

THE OLDEST and still THE BEST Hypnotic and Sedative.

Advantages:

¶ May be given with the greatest safety, being pure and free from harmful matter.

¶ No disagreeable after-effects follow its use.

¶ Never varies in strength.

The *Medical Annual* writes:

"**Battley's Solution of Opium** is a common word in the Practitioner's vocabulary. It has gained its reputation by its intrinsic value as a remedy which contains all that is sedative and anodyne in opium without its resinous constituents, which are, therapeutically speaking, impurities."

Strength—Twice that of Tinctura Opii B.P. Usual Dose—5 to 15 minims.

Issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.

NOTE.—We do not guarantee our preparations unless in original bottles with the autograph of Richard Battley over each cork and on the label, without which none is genuine.

Sole Manufacturers:

BATTLEY & WATTS, 18 Wellclose Sq., London, E.

Telegraphic Address: "Sedative, London." *Telephone:* Central 2183.

Of value in Infantile Diarrhœa

As a diet for infants during the summer months Savory & Moore's Food has many advantages. Its soothing, demulcent, mucilaginous properties, and its action in modifying milk and promoting its digestibility make it especially valuable in cases of Diarrhœa, Dysentery, and the ailments to which infants are so liable in hot weather. These claims for Savory & Moore's Food are borne out in a very striking manner by the testimony of those who have used it, two instances of which are given below.

From a Hospital Nurse

"The five months old babe here is a delicate-looking child and a bad sleeper. He was very bad with Diarrhœa consequent upon indigestion when I came. In spite of citrate of soda, he could not manage his milk at all. I added Savory & Moore's Food to it, and by the end of a week he was much better, and now the motions are quite natural and he is beginning to pick up."

From a Medical Man

"The Diarrhœa and Sickness from which my infant was suffering ceased almost as soon as I put him on your food, and he commenced to thrive, and is now the picture of health. He is being fed on nothing but your food, and I intend to keep him upon it until he is old enough for solid food. I may say that I had tried several other foods prior to yours, but found baby was unable to digest them." ——, M.R.C.S., L.R.C.P.

A SAMPLE OF THE FOOD, with full particulars, will be forwarded on application to Savory & Moore, Ltd., Chemists to The King, 143, New Bond Street, London, W.1.

SAVORY & MOORE'S FOOD

HEARSON'S SPECIALITIES

Contractors to the War Office, Colonial and Indian Governments, Crown Agents for the Colonies, London County Council, &c. On the Admiralty List.

RENOWNED FOR PERFECT REGULATION OF TEMPERATURE, DESIGN, AND WORKMANSHIP.

Anhydric Electric Incubator.

COOL AND OPSONIC INCUBATORS. ANHYDRIC ELECTRIC INCUBATORS.

WASSERMANN AND ICE INCUBATORS.

COMPARTMENT AND PARASITIC INCUBATORS.

PARAFFIN BATHS AND OVENS.

STEAM AND HOT AIR STERILIZERS.

HEATED BY GAS, OIL, OR ELECTRICITY.

The above are regulated by means of a patent capsule and have entirely superseded in all modern and up-to-date Laboratories those fitted with old mercurial regulator and thermostatic bar for governing temperature.

WINCHESTER QUART SHAKERS. TEST TUBE AND BOTTLE SHAKERS.

WATER BATHS AND AUTOCLAVES.

CENTRIFUGES (HAND, WATER, AND ELECTRIC).

Capacity (from 30 c.c. to 5 litres). Speeds (from 3000 to 25,000 r.p.m.).

Prices and Particulars on application.

Showrooms at Factory showing every Apparatus listed—WILLOW WALK, BERMONDSEY, S.E.

THE BURBERRY

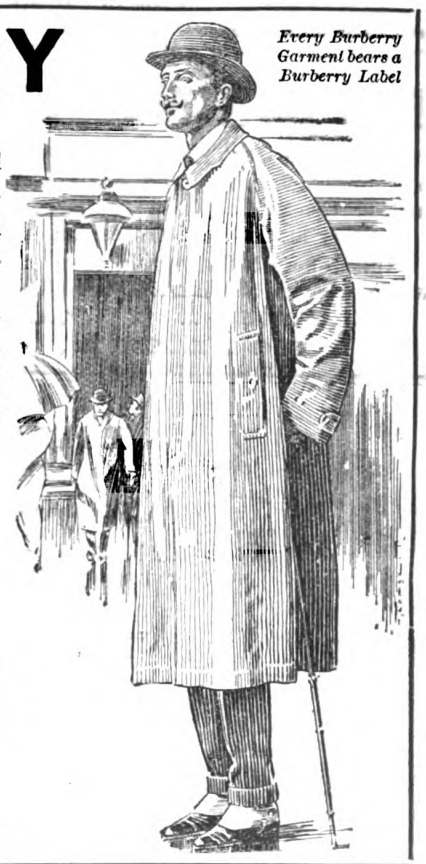
The Super-Weatherproof

REPRESENTS the most economical and distinguished form of protection in out-door Dress for war-time.

THE BURBERRY, by its efficient resistance to rain and cold winds, ensures comfort and security under conditions entailing prolonged exposure to chill and damp.

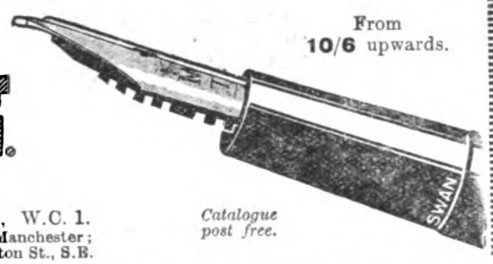
THE BURBERRY, by faultless natural ventilation, entirely avoids the vitiated heat of macintosh or rubber-lined coats.

THE BURBERRY is airylight and gives a splendid sense of freedom, whilst its hygienic warmth in severe weather proves invaluable for maintaining health and comfort.



Patterns, Prices, and Catalogue sent on application.

BURBERRYS' CLEANING WORKS.
Men's and Women's Dress Cleaned and Dyed by the most up to-date process. Weatherproof garments cleaned and reproofed in the shortest possible time. Moderate charges. Price list sent on request.



BURBERRYS' BASINGSTOKE HOUSE treats direct commissions from Doctors as approval orders*—i.e., *replaces with its own cheque returned non-approved garment.

BURBERRYS
BASINGSTOKE (LONDON HAYMARKET, S.W.)

Every Burberry Garment bears a Burberry Label

"The 'Swan' Fountain Pen with which this letter is being written was purchased quite twenty-five years ago. I have used this pen daily ever since, and a low average would be 100 words a day, or a total of 912,500 words. This is understating it. In addition to this, in one year (14 years ago) I wrote a single manuscript with this pen containing 45,000 words."—*An Extract from a Letter by a "Swan" user.*

From **10/6** upwards.

"THE HOUSE FOR EVERYTHING ELECTRO-MEDICAL."

THE "GALVANOSET" No. 1.

The Latest Development in MEDICAL ELECTRICITY.

SEND FOR DESCRIPTIVE PAMPHLET.

For any Continuous Current supply of any voltage	Price	£8 8 0
For any Continuous or Alternating Current supply of any voltage	,,	£9 9 0
Extra for Faradisation Attachment	,,	£1 15 0

For TRUE GALVANISATION, TRUE FARADISATION, IONISATION, ELECTROLYSIS, MUSCLE REACTION TESTING, ILLUMINATION OF SURGICAL LAMPS, &c.

The "GALVANOSET" is a device for safely utilising the main supply of electricity for medical purposes.

The following advantages render the "GALVANOSET" superior to all other methods:—

Nothing to get out of order.	Nothing to wear out.	Any desired current.
No expense for upkeep.	Costs less than one farthing per hour to run.	Light and portable.
Always ready for use.	Safe under all circumstances.	Provides a true galvanic current.
Does not require re-charging.	Finest range of adjustment.	Weighs 7 lbs. only.

The Commandant of the Red Cross Auxiliary Hospital for Officers, 11, Chichester-terrace, Brighton, writes:—

"I shall be obliged if you will send me by return another Galvanoset. The two I have already are working excellently. You will remember that the current is 220 continuous."

Demonstrations Daily on Ionisation, Galvanisation, Faradisation, Electrolysis, &c., 3 to 6 p.m.

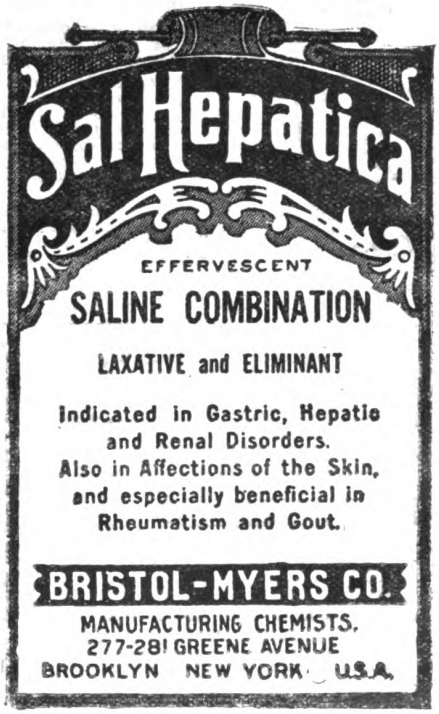
Telephone: 898 HOLBORN.

ASTHMA,

CHRONIC BRONCHITIS, BRONCHITIS, ASTHMA, HAY FEVER, and INFLUENZA.

This remedy is made by passing thick bibulous paper through a Solution of Nitrate of Potash, Chlorate of Potash, and other Chemicals.

DIRECTIONS.—Fold and place one or two pieces of paper on a dish and light the top as illustrated. A dense fume will then arise and gradually fill the room; and after inhaling it for a few minutes the air tubes will be cleared of mucus, the difficult respiration will cease, and the patient will fall into a sound and refreshing sleep. The outer air must be excluded by keeping the windows, doors, and chimney closed. The paper may be burned in the day as well as at night if necessary.



Price 2s. 9d., 4s. 6d., and 11s. per box.

Dr. Thorowgood, Physician of the City of London Hospital for Diseases of the Chest, in his "Notes on Asthma," page 62, says:—"The Ozone Paper prepared by Mr. Huggins contains nitrate of potash, chlorate of potash, and iodide of potassium, and of its efficacy I have had abundant evidence." Dr. Woodward, Worcester:—"Your Ozone Papers have given me more permanent benefit than any other remedy I have tried have also found the same with regard to my Asthmatic patients."

Usual discount to the Profession and Trade.

The appointment will be for six months, renewable at the pleasure of the Committee of Management.

Salary £150 per annum, with board and residence.

Applications, with copies (only) of testimonials, should be forwarded to the Secretary, Italian Hospital, Queen-square, London, W.C., on or before Tuesday, the 31st July next.

Royal National Sanatorium for Con- SUMPTION and DISEASES of the CHEST, Bournemouth.—RESIDENT MEDICAL OFFICER and CLINICAL TUBERCULOSIS OFFICER.—The Committee invite applications for the position of Resident Medical Officer (Male).

The candidate selected will, subject to the approval of the Borough Council and the Local Government Board, hold the appointment of Clinical Tuberculosis Officer to the County Borough of Bournemouth, and in this capacity will be required to attend three times weekly at the Municipal Dispensary (adjoining the Sanatorium).

The salary in respect of the post of Resident Medical Officer will be £300, rising to £400, per annum, with board, residence, and washing. For the post of Clinical Tuberculosis Officer there will be an additional salary of £130 per annum.

Applications should be made on forms to be obtained from the Secretary, to whom they must be sent in, with copies of recent testimonials, not later than July 21st, 1917.

Canvassing will disqualify. A. G. A. MAJOR, Secretary.

Greenwich Union.—Greenwich Union INFIRMARY.—Election of ASSISTANT MEDICAL OFFICER.—The Guardians require the services of a fully qualified Medical Practitioner as Assistant Medical Officer of the Infirmary and Workhouse. The appointment is for one year.

Candidates must be single and not be eligible for service in H.M. Forces.

The Officer appointed will be expected to act generally under the direction of the Medical Superintendent.

Salary £200 per annum, with furnished apartments, rations, and washing, subject to the statutory deductions under the Poor Law Officers' Superannuation Act, 1896.

Applications to be made on forms obtainable from, or by personal application (by appointment) to, the Medical Superintendent, at the Infirmary, Vanbrugh Hill, East Greenwich, S.E. 10.

By order.
W. C. CORNISH, Clerk to the Guardians.
Guardians' Offices, Board-room, East Greenwich, S.E. 10.
July, 1917

County Borough of Sunderland.— TEMPORARY TUBERCULOSIS MEDICAL OFFICER.—In the absence of the Tuberculosis Officer on Military Service, applications are invited for the appointment of a Temporary Tuberculosis Medical Officer (Male or Female), at a salary at the rate of £500 per annum.

The person appointed must be a registered Medical Practitioner, and must devote whole time to the duties of the office, and if a male must be ineligible for Military Service.

Preference will be given to those who have had special practical experience in the treatment of Tuberculosis at a Sanatorium or otherwise. Experience in the use of Tuberculin, and of other special treatment, is important.

The officer appointed will have charge of the Tuberculosis Dispensary and the general arrangements for the provision of Tuberculosis treatment thereat, and at the Tuberculosis Pavilion at the Borough Sanatorium. He must be prepared to act as expert adviser of the Borough Insurance Committee in regard to the diagnosis and treatment of cases of Tuberculosis.

Canvassing, directly or indirectly, until after the first selection of candidates by the Committee will disqualify.

Applications, stating age, qualifications, and previous experience, accompanied by copies of not more than three recent testimonials (which will not be returned), to be forwarded to the undersigned not later than 10th July, 1917, endorsed "Tuberculosis Officer."

Note.—A sum of £50 per annum is at present being paid to the Officer in respect of treatment of County patients in addition to the salary mentioned. H. CRAVEN, Town Clerk.

Town Hall, Sunderland, 23rd June, 1917.

Queen Mary's Hospital for the East END (170 beds).—Wanted, HOUSE SURGEON, to commence duties in August. Applications should be addressed to the under signed. Male applicants must be ineligible for Military Service.

A. W. SCRIVENER, Secretary.

Westmorland Sanatorium and Home, Grange-over-Sands (135 beds).—LOCUM TENENS ASSISTANT MEDICAL OFFICER required for three weeks, commencing August 4th, 1917. Salary 7 guineas per week, with board, apartments, and laundry. Preference given to applicants with some Sanatorium experience. Duties include routine laboratory work. Apply to the Medical Superintendent.

Burton-on-Trent Infirmary.—House SURGEON.—The Committee require the services of a duly qualified Resident House Surgeon. 102 beds—half military, half civilian. Salary £250 per annum, with comfortable rooms, board, coal, and light. Duties to commence about the middle of July.

Applications, stating age and experience, and accompanied by copies of testimonials, should be sent at once to the Hon. Secretary, Mr. JOHN WOOD, The Infirmary, Burton-on-Trent.

The South London Hospital for WOMEN, South Side, Clapham Common, S.W. 4.—The Board of Management invite applications from fully qualified Medical Women for the posts of HOUSE PHYSICIAN and HOUSE SURGEON. Appointments for a period of six months' respectively to date from August 1st.

Salaries at the rate of £100 per annum respectively, with board, residence, and laundry.

Applications, with copies of testimonials, to reach the Secretary, at the Hospital, not later than the first post on July 9th.

Royal Albert Hospital, Devonport.— The post of HOUSE SURGEON will be vacant on June 30th. Applicants (Gentleman or Lady) must be duly registered, and unmarried.

Salary £150, with board and laundry. Extra remuneration at the rate of 21s. a week is allowed when working single-handed.

Further particulars as to the appointment will be furnished by the undersigned.

Applications should be addressed to the Chairman of the Selection Committee.

By order.
CHAS. W. DICKINSON, Capt. R.N., Hon. Sec.
Royal Albert Hospital, Devonport, 8th May, 1917.

County Borough of Stoke-on-Trent.— ASSISTANT LADY MEDICAL OFFICER.—Applications are invited for the position of Assistant Lady Medical Officer in connexion with the Maternity and Child Welfare Work, &c., in the Borough. Salary £350 per annum. Particulars as to the duties and the conditions of the appointment may be obtained on application to the Medical Officer of Health, St. Peter's Chambers, Glebe-street, Stoke-on-Trent. Applications, endorsed "Assistant Lady Medical Officer," and accompanied by copies of three recent testimonials, to be delivered to me not later than 12 noon on Tuesday, July 10th, 1917.

E. B. SHARPLEY, Town Clerk.
Town Hall, Stoke-on-Trent, June 28th, 1917.

Walsall Education Committee.— Appointment of Temporary SCHOOL MEDICAL INSPECTOR.—The Committee invite applications from qualified medical men (who must be ineligible for Military Service) and women for the post of Temporary School Medical Inspector.

The appointment will be for the duration of the war, or until the present Inspector (who will be called to the colours in the near future) returns from service with H.M. Forces.

The salary will be at the rate of £400 per annum. Forms of application, to be returned not later than Saturday 14th July, 1917, and a list of duties, &c., may be obtained of the undersigned.

W. SCARLETT, Acting Secretary.
Education Offices, Council House, Walsall, 3rd July, 1917.

Durham County Council. — The County Education Committee invite applications for the post of ASSISTANT SCHOOL MEDICAL OFFICER (woman), to act under the County Medical Officer, in connection with the inspection of children attending elementary schools, and such other duties as may from time to time be required by the Education Committee.

The salary will be £300 per annum, rising by annual increments of £25 to £350 per annum (in addition to a war bonus at the rate of £25 per annum), together with reasonable travelling and out-of-pocket expenses. The successful candidate will be required to devote her whole time to the duties of her office, and to reside in or near the district to which she may be attached, at a place to be approved by the County Education Committee.

In making the appointment preference will be given to the candidate who has

(1) Enjoyed special opportunities for the study of the diseases in children.
(2) Had some definite experience in school hygiene; and
(3) Had adequate training in State Medicine, or holds a diploma in Public Health.

The appointment will be subject to three calendar months' notice on either side, to expire on the last day of any calendar month. Applications, endorsed "School Medical Inspector," accompanied by copies of not more than three testimonials, must be sent not later than Wednesday, the 18th July, 1917, to the undersigned, from whom forms of application (to be completed in candidate's own handwriting) can be obtained.

Canvassing, directly or indirectly, is prohibited, and will disqualify.

A. J. DAWSON, Clerk to the Education Committee.
Shire Hall, Durham, 2nd July, 1917.

Liverpool Eye and Ear Infirmary, Myrtle-street, Liverpool.—Applications are invited for the post of LADY HOUSE SURGEON. Particulars as to duties, remuneration, &c., may be obtained from the Hon. Sec. of the Medical Board.

Monmouth County Asylum, Abergavenny. — Wanted, a Temporary ASSISTANT MEDICAL OFFICER (Female, or Male ineligible for Military Service) for the duration of the War. Salary £7 7s. per week, with board, apartments, and attendance. Apply to the Medical Superintendent, stating age, and enclosing not more than two recent testimonials.

Assistant Medical Officer (Male or Female) required at THE CHILDREN'S INFIRMARY, Clarendon Street, London, W. 1. (under the Metropolitan Asylums Board), 234 beds. Salary £250 per annum, with board, lodging, and washing.

Forms of application may be obtained by sending stamped addressed foolscap envelope to the Clerk to the Metropolitan Asylums Board, Embankment, London, E.C. 4, by whom applications must be received not later than 10 A.M. on Monday, 16th July, 1917.

City of York.—Temporary Tuberculosis Officer.—The York City Council invite applications for the post of temporary Tuberculosis Officer from persons experienced in the diagnosis and treatment of Tuberculosis. Applications from persons of either sex will be considered, but male applicants must be ineligible for Military Service. The candidate appointed must devote whole time to the work. Salary at the rate of £500 per annum, the appointment to be terminable at two calendar months' notice. Applications (stating when available) and accompanied by copies of three recent testimonials, should be delivered not later than the 10th July, 1917, to

PERCY J. SPALDING, Town Clerk, Guildhall, York.

National Hospital & University College HOSPITAL SCHOOL OF MASSAGE AND ELECTRICAL TREATMENT, Queen Square, W.C. 1. (In connexion with University College Hospital, Gower-street, W.C., and the National Hospital for the Paralysed and Epileptic, Queen-square, W.C. 1.)—Wanted, a Woman as HEAD OF THE SCHOOL, to commence her duties not later than September 1st. Salary £200 a year, with board and lodging. It is expected that the School Session will start early in October, and the curriculum includes the teaching of Massage, Remedial Exercises, and Medical Electricity.

Applications, stating age and qualifications, accompanied by not more than three recent testimonials, should be addressed, on or before July 14th, to the Secretary, National Hospital Queen Square, W.C. 1.

Queen Charlotte's Lying-in Hospital, Marylebone-road, N.W.—ASSISTANT RESIDENT MEDICAL OFFICER, Male (ineligible for Military Service) or Female, required. Applicants must be registered. The appointment is for four months. The selected candidate will be expected to proceed to the appointment of Senior Resident Medical Officer (also for four months) at the end of the term of office on the recommendation of the Medical Staff. The salary of the Assistant Resident Medical Officer is at the rate of £80 per annum, and of the Senior Resident Medical Officer £80 per annum, with board, residence, and washing. Applications, with copies (not originals) of not more than three testimonials, will be received by the Secretary up to July 11th.

Canvassing is prohibited. Duties to commence on 1st August, 1917.

ARTHUR WATTS, Secretary.

County Borough of Sunderland.—EDUCATION COMMITTEE—Temporary SCHOOL MEDICAL OFFICERS.—Applications are invited from fully-qualified women or a man not eligible for Military Service for the post of Temporary School Medical Officer during the absence of the permanent Staff on Military Service. The person appointed will be required to devote his or her whole time to the service of the Education Committee, and will not be permitted to undertake any private practice or to hold any other appointment without the sanction of the Committee. Salary £450 per annum.

The appointment will be subject to three months' notice in writing given by either party.

Applications—to be made on forms which may be obtained from the undersigned—must be returned on or before 21st July next, accompanied by copies of not more than three testimonials. Canvassing, either directly or indirectly, until after the first selection of candidates by the Committee, will disqualify the applicant by whom or on whose behalf such canvassing shall have been made.

HERBERT REED, Secretary.

Education Department, 15, John-street, Sunderland, June, 1917.

Liverpool Royal Infirmary.—Treatment of VENEREAL DISEASES.—The Committee propose to appoint one Male and one Female CLINICAL ASSISTANT. Each must be legally qualified, and be prepared, if necessary, to attend In patients under the direction of the Honorary Surgeon of the Department.

The Male Assistant will be required to assist the Honorary Surgeon for two hours on three days a week in the Out-patient department—viz., Monday and Friday at noon, and Wednesday in the evening.

The Female Assistant will similarly be required to attend on one day a week—viz., Thursday at noon.

Salaries £250 for Male Officer, £100 for Female Officer. The Assistants will be allowed to engage in private practice.

The applications, which are subject to the approval of the Local Government Board, will be made for one year, and the holders will be eligible for reappointment.

Applications, stating age, qualifications, experience, and with testimonials, to be sent to the undersigned not later than Monday, 23rd July.

FRANCIS H. MOORE, Gen. Supt. & Secretary.

Insurance Committee for the County OF LONDON.—Applications are invited for the position of MEDICAL ADVISER to this Committee. Candidates should be of high professional standing, with special knowledge and experience of the diagnosis and treatment of Tuberculosis. Form of application and further particulars of the appointment, which is of a temporary and part-time character, may be obtained on application to the undersigned. Canvassing is a disqualification. Applications must be received at the Offices of the Committee not later than the first post on Friday, the 20th July, 1917. THOMAS BATEY, Clerk of the Committee.

Insurance-street, W.C. 1, June 29th, 1917.

(J. & A. CARTER) Ltd.,
2, 4 & 6, NEW CAVENDISH ST.,
LONDON, W. 1.

The "Iverna" Wheel-Carrying Chair.

The NORWICH
CRÊPE BANDAGE
SUPERIOR ENGLISH MANUFACTURE
Extremely elastic, but contains no rubber
FAST WOVEN EDGES.

"It's the greatest comfort in the world for every case of Varicose Veins."

THE BANDAGE THAT CAN BE STERILIZED.

IMPORTANT
THE EDGES WILL NOT FRAY OUT NOR RAVEL.

Invaluable for all binding purposes. Entirely displaces bandages of rubber and elastic web. Considerably more durable, although less than one-third the cost of rubber or elastic web.

WOOL v. COTTON
Sterilized Bandages.

Patients having varicose veins and other ailments requiring the use of bandages usually suffer from cold extremities due to bad circulation. They require *warmth* as well as support. The Norwich Crêpe Bandages, containing wool, provide this warmth and do not absorb grease so readily as those made of cotton. Moreover, they may be thoroughly cleansed by the use of *hot* (not boiling) soapy water, with the addition of a little ammonia or soda. The bandages are healthy and comfortable to wear, giving the necessary firmness, yet yielding to every movement. Self-clinging and self-adjusting

The Norwich Crêpe Bandage is made and supplied to the leading wholesale houses, neatly wrapped in labelled packages. Its inexpensiveness, compared with foreign productions, and its high quality, universally commended by the medical and nursing professions, make it ideal for sufferers from varicose veins and for all purposes where bandages are required. Send for prices and samples to the sole manufacturers:

THE NORWICH CRAPE CO. (1856) LTD.,
St. Augustine's Silk Mills, Norwich, Eng.

London buyers can obtain samples and prices from Mr. T. Eastaway, London representative.? . Wool Exchange. E.C. 2

Provincial Selling Agents:
Messrs. Freese & Moon, 100, Bermondsey Street, London, S.E. 1.

Albee's Modern Orthopedic Surgery

READY SOON

This new book takes up modern orthopedic surgery not only of the child but of the adult as well. Besides including all the surgery of the bones, joints, tendons, muscles, ligaments, and fascia, it contains a great mass of organised information relative to the bone-graft—its advantages, use, and technic, graphically illustrated. The work is much more than a treatise on the use of braces, frames, plaster-of-Paris, and other essentially non-operative procedures: It is a full and complete presentation of *operative* orthopedic surgery as well. It covers this latter side more thoroughly than any other work in any language. The sections devoted to *military surgery* are particularly apropos at this time, as seventy-five per cent. of the surgical conditions resulting from the present world-war represent the very type of cases to which this book devotes considerable space. Doctor Albee gives you, in addition to his previous experience, the invaluable knowledge gained by him during four months' work in the military hospitals of France during the past year, including a simplified method of applying the Carrel-Dakin solution. A large portion of the book is given over to the modern treatment of traumatic conditions—both major and minor. The illustrations are original and numerous.

Octavo of 700 pages, profusely illustrated. By FRED H. ALBEE, M.D., Professor of Orthopedic Surgery at the New York Post-Graduate Medical School.

In order to obtain this book immediately on publication you should send your order NOW.

Moynihan's Abdominal Operations — Third Edition

"The work is marked by a well-balanced estimate of the value of, and the indications for, the various operative procedures described, by discussion of the views of other surgeons, which shows a wide acquaintance with their practice and their writings, and by careful descriptions of technique which will place many a surgeon under an obligation to the author."—BRITISH MEDICAL JOURNAL.

Two handsome octavos of 500 pages each, with 385 illustrations. By Sir BERKELEY MOYNIHAN, M.S. (London), F.R.C.S. Cloth, 46s. net.

Anders' Practice of Medicine — Twelfth Edition

"This revision must have necessitated a very wide examination of special monographs, pamphlets, and journals, since many of the matters treated have as yet found their way into but few text-books. Questions of diagnosis and treatment are discussed with special care."—THE LANCET.

By JAMES M. ANDERS, M.D., Ph.D., LL.D., Professor of the Theory and Practice of Medicine and of Clinical Medicine, Medico-Chirurgical College of Philadelphia. Octavo of 1535 pages, illustrated. Cloth, 24s. net.

Bandler's Medical Gynæcology — Third Edition

"Dr. Bandler has done valuable service in placing before his readers a clear account of the many methods of treatment which are available for the practitioner."—THE LANCET.

"Dr. Bandler's book contains a lot of information on subjects and methods of treatment not usually dealt with in detail in text-books of gynæcology."—MEDICAL PRESS AND CIRCULAR.

Octavo of 790 pages, with 150 original illustrations. By S. WYLLIS BANDLER, M.D., Adjunct Professor of Diseases of Women, New York Post-Graduate Medical School and Hospital. Cloth, 21s. net.

Anders & Boston's Medical Diagnosis — Second Edition

"We have no hesitation in pronouncing it to be in every sense worthy of the reputation of its distinguished authors, who have succeeded in producing an excellent text-book capable of guiding the student and practitioner safely through the intricate paths of medical diagnosis."—MEDICAL PRESS AND CIRCULAR.

Octavo of 1250 pages, with 450 original illustrations. By JAMES M. ANDERS, M.D., Ph.D., LL.D., Professor of Theory and Practice of Medicine; and L. NAPOLEON BOSTON, A.M., M.D., Adjunct Professor of Medicine, Medico-Chirurgical College, Philadelphia. Cloth, 25s. net.

Books sent, Carriage Paid, on Receipt of Price.

W. B. SAUNDERS COMPANY, 9, Henrietta Street, London, W.C. 2.

HUGH THOMPSON, M.A., M.D.; J. W. THOMSON WALKER, F.R.C.S.; W. L. DE COURCY WHEELER, B.A., M.D., F.R.C.S.; A. GASCOIGNE WILDEY, Dep. Surg.-Gen. R.N.; MARGUERITE WILSON, M.B., Ch.B., Glasgow.

This year's volume has a unique value. It is a faithful digest of current Medical and Surgical thought, and hence is coloured of necessity by the War. But War problems will confront the Practitioner on every hand, and he must be prepared to deal with them. Such a digest cannot be obtained elsewhere.

UNIFORM IN SIZE WITH THE "MEDICAL ANNUAL." **8/6 *net.***

"A FIRST-RATE ACQUISITION FOR EVERY PRACTITIONER."

THE MEDICAL ANNUAL SYNOPTICAL INDEX

TO REMEDIES AND DISEASES for the Ten Years 1905 to 1914:
together with a Dose Index in Imperial and Metric measures in accordance with the British Pharmacopœia, 1914, and indicating the alterations that have been made.

Subscribers now serving abroad can have a copy reserved on sending a post card to the Publishers. Payment and delivery can await their return if desired. As this work, in addition to its own valuable information, renders every fact contained in the ten volumes of the Annual immediately available for reference, the Publishers will gladly reserve the remaining copies for Subscribers to the Annual who possess the volumes to which it refers.

OPINIONS REGARDING THE PRECEDING VOLUMES.

Reading. "I desire to congratulate you . . . of the greatest use to all busy practitioners, and to those wishing to refer to details of methods of treatment."
Glasgow. "I am delighted with this book: medical men must find it a treasure." *Guildford.* "Will be of the greatest possible use, and is most capitally done."
"It is by no means necessary that the reader should possess all the numbers to render this volume of use—it is a work in itself, and contains a vast amount of information."—*Lancet.*
"A perfect gem of an index, with cross references. The multitude of facts compressed into the small compass of its four hundred pages makes the book one of permanent value."—*Medical Press and Circular.*

Before Making an Investment
LARGE OR SMALL
CONSULT

"THE 100 BEST INVESTMENTS"

ANNUAL VOLUME.

The above work contains full details of 100 investment securities specially selected as being, at their present quotations, the most attractive of their respective classes. The 100 stocks selected cover British, Colonial, and Foreign Government Loans, Municipal Loans, Debentures, Preference Shares and Ordinary Shares of industrial companies, special attention being paid to certain groups, such as iron, steel, and allied trades, insurance, &c.

In a lengthy introductory article entitled:—
"A POLICY OF INVESTMENT TO MEET EXISTING CONDITIONS,"
the whole question of investment is envisaged from the standpoint of present-day circumstances. The volume also contains yield tables and numerous hints regarding income-tax, methods of obtaining capital appreciation, &c., of the utmost value to every investor.

DOWN BROS.' SPECIALITIES.

FINOCHIETTO'S EXTENSION STIRRUP

For Fracture of the Lower Extremity.

As used by DR. PEDRO CHUTRO, of Buenos Aires, at the Lycée Pasteur-Buffon, Paris.

Vide "La Presse Médicale," March 2nd, 1916.

ADVANTAGES CLAIMED:

The method is painless and traction is exerted through the bones without injury to them.

It admits of continuous extension in simultaneous fractures of the upper and lower parts of the limb.

Dressings are easily applied, and in cases of wounds on the posterior aspect of the thigh the patient can lie on his side without disturbing the extension.

It can be left *in situ* for weeks without injury to the os calcis.

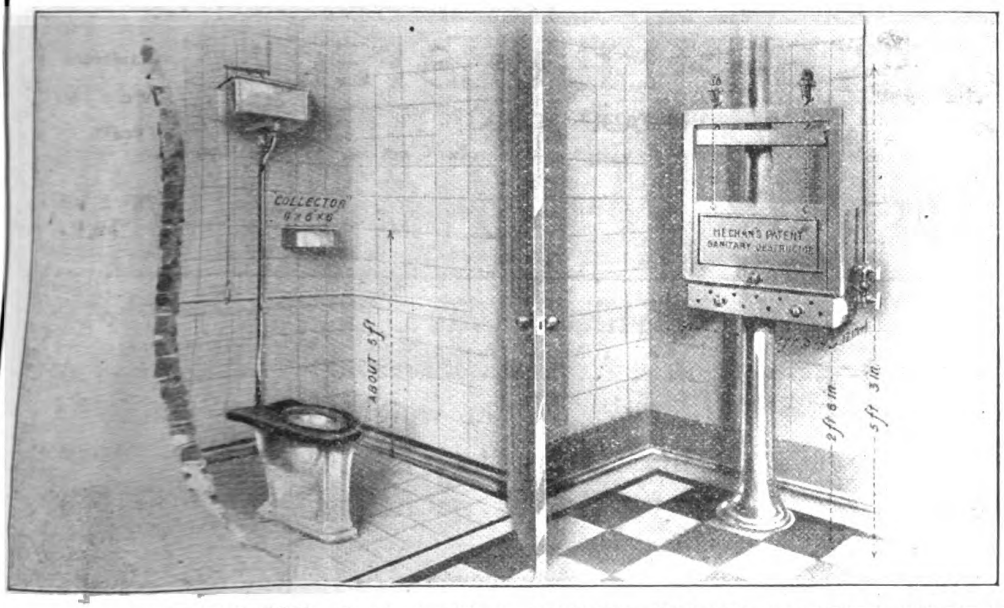
The Proof of the Pudding is in the eating.



THIS old saying was never better exemplified than in the case of sickness and accident insurance. The majority of policies are full of technical phrases, difficult to understand, and which, as a rule, include many diseases from which most men are never likely to suffer. Consequently it often happens that when a claim is made a man finds that he is NOT COVERED. For example—of what advantage is it to be able to claim for Asiatic Cholera and not for Influenza? From which of these two complaints are YOU likely to suffer? And yet most policies are framed on such glaringly anomalous lines.

The only Policy worth considering is that issued by the Medical Sickness and Accident Society, of which the following are the principal advantages:—

1. **Covers ALL sickness and accidents.**
2. **Is permanent to age 65.**
3. **Provides for temporary as well as permanent disablement.**
4. **The premiums are at least 20 per cent. lower than any other office.**
5. **The Society is mutual and controlled by Doctors for Doctors.**

Practitioners are invited to write the Secretary for full prospectus.

COPIES OF UNSOLICITED TESTIMONIALS.

DEAR SIRS,—"I find that most certainly the chest sounds are rendered clearer and more distinct by your 'Phonophore' than by any stethoscope I have used during over thirty years' work."—Yours, F.R.C.S.

DEAR SIRS,—"I have found your 'Phonophore' by far the best stethoscope I have ever used."—Faithfully yours.

Extract from the "British Medical Journal":—"Some years ago Messrs. Arnold & Sons, of Giltspur-street, E.C., brought out a Stethoscope which they named the 'Phonophore.' Its construction secured a considerably increased volume of sound, and the appliance gained favour among those dissatisfied on general grounds with ordinary stethoscopes, or whose needs, owing to some lack of aural acuity, were not adequately met thereby. Of this appliance the same firm has recently brought out a modification in which the bell-like attachment constituting the chest-piece is provided with two sound tubes instead of one. These tubes are continued upwards, the sound thus being conveyed to each ear direct from the collecting chamber. Each ear, therefore, receives the same amount of sound, although the same amount of sound may not be perceived if there is any difference in the hearing power of the two ears. The gross volume of sound is also greater than supplied even by the original 'Phonophore.' This modification of the 'Phonophore' is worth examination by anyone interested in stethoscopy."

FUNCTIONAL DISORDERS OF THE NERVOUS SYSTEM

RESULTING FROM

THE WAR

are being effectively combated by the exhibition of

THE LYMPHOID COMPOUND

This preparation is a pluriglandular product, the base of which is Spermin.

Several thousands of cases, including Neurasthenia, Anxiety Neurosis, Association Neurosis, Expectation Neurosis, Fatigue Neurosis, Traumatic Neurosis, Depression, Hysteria, Insomnia, and Physical and Mental Exhaustion, have now been successfully treated by this method by British Practitioners. In a considerable percentage of these cases other methods of treatment had previously failed to provide relief.

The results are secured by the potent neurotonic effect of the preparation and by the compensation provided by the active cellular material contained in the organic extracts of which the product is composed.

A typical report reads :–

"The outcome of my employment of the Lymphoid Compound in my cases of nervous disturbance (simple and severe) is that recoveries have been effected to the complete satisfaction of my patients."– F.R.C.S. (Edin.), M.R.C.P., L.R.C.S. (Eng).

Descriptive Brochure (No. 30), containing full information and reliable clinical evidence, will be sent post free to Practitioners on application.

Supplied to Practitioners or on their Prescriptions only.

BAILEY'S BATH TRUSSES.

They are covered in a strong flexible enamel which will last for years. They do not absorb moisture, require no drying, and are recommended for the bath, for sea voyages, and the tropics.

"No good results can be obtained from any truss while the daily bath is taken without one."

"VERILITE" TRUSSES

Weight about 3 oz., and although so light can be made to give any degree of pressure.

Strongly plated to prevent rust.

"HYGIENIC" TRUSSES

No Leather covering.
Particularly suitable for Residents abroad.
Private Fitting Rooms.
Special Department for Ladies.

IMPORTANT NOTICE.

Messrs. W. H. BAILEY & SON are prepared to send (immediately on receipt of letter or telegram) thoroughly competent Assistants, Male or Female, to attend patients at their homes and to take Doctor's instructions. They personally superintend the making and fitting of the Appliance throughout, thus ensuring the best possible results.

Price Lists and Forms for Measurement free.

CLINICAL PATHOLOGY AND RESEARCH

The Staff of the Virol Research Laboratories, which are under the control of a Medical Superintendent, consists entirely of qualified members of the medical profession with special experience in their own departments; every specimen submitted is examined and the report thereon signed by the actual investigator. The work is done exclusively for the medical profession, and in no case is any information given to the patient.

The buildings are structurally exceptionally well equipped and are open to inspection at any time during working hours by qualified members of the medical profession, who are also invited to make use of the library and reading room. Demonstrations of pathological methods are given from time to time by the Medical Superintendent.

The scale of fees has been designed to afford to the Medical Practitioner laboratory facilities for every class of patient.

A price list will be sent on application. Specimen charges are as follows:—

SYPHILIS:	Detection of spirochæta pallida in scrapings from the primary lesion by the ultra-microscope and stained films	**5/3**
	Wasserman Reaction on the blood	**5/3**
GONORRHŒA:	Detection of the organism in pus	**2/9**
DIPHTHERIA:	Microscopical and cultural examination of swab	**1/3**
TUBERCLE:	Examination of sputum for T.B.	**1/3**
AGGLUTINATION TEST	for typhoid, paratyphoid, &c. ...	**2/3**
BLOOD:	Examination of spread films with differential count of leucocytes	**7/9**
TUMOURS, &c.:	Report with mounted paraffin section ...	**6/3**
URINE:	Simple qualitative examination with microscopical examination of centrifugalized deposit	**4/9**
AUTOGENOUS VACCINE	with twelve graduated doses ...	**21/3**

The "GLAXO" Stool Chart.

Scheme suggested by R. HAROLD COOPER, M.R.C.S., L.R.C.P., Radiol

The copyright in this Chart is owned by "GLAXO," of 155—157, Great Portland Street, London, who have the sole right to publish and issue same to the public.

A New Stool Chart

Specially useful in cases of Summer Diarrhœa.

This Stool Chart has been designed by a Doctor who had experienced the difficulty of obtaining a reliable daily record of patient's progress. The Chart overcame this difficulty. We now offer a supply to members of the Medical Profession.

The Chart is divided into two parts: top and bottom half. The top part is ruled to record the patient's weight, and the daily loss or gain. The bottom is ruled and coloured to record the number, colour, consistency, and size of each stool, as well as the pulse and respiration of the patient.

As can be seen, the Chart is designed to give to the Medical Man the precise information needed at the precise time it is required.

Copies of the Chart, together with Samples, Analysis, and Bacteriological Report gladly sent free on application.

An Urgent Call to Save the Babies!

THE present loss of Infant life—at a moment when these little lives are more precious than ever—is a matter of the gravest concern to the Nation.

Each year 100,000 infants perish in the United Kingdom. This appalling mortality—quite half of which is avoidable—is largely due to improper feeding and to contaminated milk.

The Child's birthright is its Mother's milk, but where that is absent, small in quantity, or of poor quality, the best—the only—alternative is NESTLÉ'S MILK.

Read these Significant Figures:

Out of every thousand babies born in the British Isles 120 (or 12%) die during their first year.

Out of 3,090 infants reared on Nestlé's Milk no fewer than 3,000 were in perfect health *at the average age of 2½ years*—only 63 (or just over 2%) had died from Measles or other illnesses.

A true food such as Nestlé's not only reduces baby's liability to infantile ailments—it proves itself in later years as in babyhood—and here is the crowning triumph of Nestlé's: Thousands of the very men on whom to-day the safety of the Empire hangs were reared on

NESTLÉ'S MILK

The Proprietors of Nestlé's Milk have published, under the title of **"Heroes All,"** a magnificent Album of Portraits of over 200 of these men, together with the testimony of their parents. This book will carry the final word of conviction, and we want every Medical Man in the Kingdom to see it. A complimentary copy sent post free on application to

NESTLÉS, 6-8 EASTCHEAP, LONDON, E.C. 3.

When a Patient asks

What Shall I Drink?

SALUTARIS—pure water distilled by a special process—is not only one of the safest and purest of beverages for general use by adults. It has also proved a valuable adjunct in the treatment of many morbid conditions arising from defective elimination It may be recommended with confidence in most cases of chronic constipation, and of rheumatism, gout, or other disorders associated with excessive retention of uric acid.

There is probably no dissolvent of uric acid so certain in its cumulative effect and at the same time so free from the risk of unfavourable reaction.

Patients appreciate the soft, agreeable character of this well-known British Water, especially at the present time when imported Table Waters are both scarce and expensive. Where an aerated beverage is desirable, Sparkling Salutaris will be found equally palatable and beneficial. Where carbonic acid gas is contra-indicated, Still Salutaris should be recommended.

In the Dispensary

Many Medical Practitioners know by experience that Salutaris A.D. Water is far superior to ordinary distilled water, for use in dispensing. For the exceptional purity of Salutaris develops the full power of drugs, perfecting their action, and ensuring that highest degree of excellence which alone can yield the results required by the physician. These interesting results are primarily due to the Salutaris Process of Distillation, which possesses an hygienic value not approached in merit by any other system. They are also due to the scientific methods employed in cleansing and sterilising the jars in which Salutaris A.D. is supplied.

Salutaris

The most healthful drink in the world.

Terms for Medical Profession on application to the Distillery, 236, Fulham Road, London, S.W. 10.

37 Times More Powerful than Lithia.

An Ideal Antiseptic

of wide applicability in the treatment of infected wounds and in surgical practice.

CHLORAMINE-T

p-toluene-sodium-sulphochloramide.

Introduced by Dr. H. D. Dakin and his colleagues of the Leeds University.

The use of the Hypochlorite antiseptics marks a new era in treatment. The new product—CHLORAMINE-T—is a great advance on the solutions containing Hypochlorous Acid which are now so widely used. It is practically non-toxic, does not coagulate blood serum, and is stable both in powder and solution. It may be employed not only for the treatment of wounds, but also as a mouth wash, nasal or vaginal douche, and for urethral irrigation.

Supplied in Powder in 1oz. bottles 1/2; 4oz. 3/6; 1lb. 12/6. Also in Tablets—8·75 grs.—bottles of 25, 1/4; 50, 2/6; 100, 4/6. Tablets—43·75 grs.—bottles of 12, 2/8; for making solutions of known strength. All post free.

Chloramine-T Gauze

containing approximately 5% Chloramine-T is also prepared. It is a non-toxic and non-irritating antiseptic gauze, and should be used dry, and subsequently moistened (if necessary) when in position.

Supplied in Rolls, 1/- each, post free.

May be ordered from any of the 555 branches of Boots *The* Chemists or direct from Headquarters.

Advances in Treatment Gonorrhœa

"Argein"

Regd. Trade Mark.

An improved, readily soluble form of Colloidal Silver Proteinate, Containing 8 per cent. of Silver.

"Argein" is compatible with the saline and albuminous secretions; it has penetrating Antiseptic and Bactericidal properties, and is specially indicated in

ACUTE AND CHRONIC GONORRHŒA

Sold in Scales, 1 oz. bottles, 3/6; Solution Tablets, tubes of 25, 2/-; Bougies, boxes of 12, 4/-; Pessaries, boxes of 6, 2/6; and Prophylactic Drops, boxes of 6 dropper-tubes, 2/6.

"Kavol"

Regd. Trade Mark.

"Kavol" consists of Gelatin Capsules containing Sandal Wood Oil of the finest quality, and a specially prepared Extract of Kava-Kava.

Dose: 1 to 3 Capsules two or three times daily.
Sold in boxes of 30 Capsules, 2/6; and 60, 4/6.

"Cystazol"

Regd. Trade Mark.

This preparation is Hexamethylenetetramine-sodio-benzoate and is of great value in *Cystitis, Bacilluria and Bacterial Infections of the Urinary Tract* generally.

"Cystazol" raises the acidity of the urine and thus enhances the activity of the hexamethylenetetramine by favouring liberation of formaldehyde; on this account it is superior to all other formaldehyde compounds.

Dose: One to three tablets, dissolved in water, twice or three times daily.
Sold in bottles of 20, 1/6; 40, 2/6; 80, 4/6.

A Doctor of Medicine writes: "*I am greatly obliged to you for sending me a sample of 'Cystazol,' which I have found to be the best urinary antiseptic I have yet tried; I have been infected with Bacillus Coli for about a year and nothing has removed the offensive odour of the urine so effectually.*"

The 'Allenburys' Foods

Infantile Diarrhœa

During summer, Diarrhœa and kindred disorders among Infants are largely due to the use of infected cow's milk.

The "Allenburys" Milk Foods

are absolutely free from all harmful bacteria, and are made ready for use with boiled water.

The foods are easily digested and assimilated, and contain both fat and proteids in similar relative proportions to those found in human milk. They are capable also of further modification, when desired, to suit the most delicate Infants from birth.

The "Allenburys" Milk Food No. 1
FROM BIRTH TO 3 MONTHS.
This closely approximates in composition to human milk. It keeps thoroughly well, is easily prepared, the addition of hot water only being necessary.

The "Allenburys" Milk Food No. 2
FROM 3 TO 6 MONTHS.
Is similar to the Milk Food No. 1, with the addition of a small amount of soluble phosphates and albuminoids.

The "Allenburys" Malted Food No. 3
FROM SIX MONTHS UPWARDS.
Is a partially digested farinaceous food, and requires the addition of boiled cow's milk and water.

The "Allenburys" Rusks (Malted)
A valuable addition to baby's dietary when 10 months old and after.

A full descriptive pamphlet and samples will be sent on request.

PITUITRIN*

shows brilliant results in obstetrical practice.

PITUITRIN is undoubtedly the most reliable oxytocic ever offered to the medical profession. From all over the world we are receiving evidences of its value in difficult parturition. Expert obstetricians assert that it is without a rival as a corrective of uterine inertia.

P.A.H., in a record of 60 cases of labour in which he had used Pituitrin, states that he has found it a valuable aid to shortening the long and often exhausting first stage of labour. It appears to have a calming effect upon patients of nervous temperament, to obviate post-partum urine retention, and to be very effective in post-partum hæmorrhage (*British Medical Journal*, 1914, I., 906 and 1098).

R. J. states that in over 60 cases during 18 months he has not once had a bad result. The placenta came away promptly after the birth of the child, and in no instance did post-partum hæmorrhage occur (*British Medical Journal*, 1914, II., 420).

E. H. states that Pituitrin is a most valuable help to patient and doctor, considerably shortening labour, usually obviating the use of forceps, and permitting the use of chloroform without inhibition of uterine contractions (*British Medical Journal*, 1914, I., 995).

Lindeman says that Pituitrin is of undoubted value in almost all cases of simple inertia and fatigue of the uterine muscle (*American Journal of Obstetrics*, February, 1914).

Hofbauer states that Pituitrin affords the great advantage of shortening the duration of labour, also that in many cases it obviates the necessity for forceps delivery, version dilation, breech extractions, etc. (*Centr. für Gynæk.*, January 28, 1911).

PITUITRIN IS SUPPLIED IN AMPOULES OF 0·5 C.C. AND 1 C.C. ALSO IN BOTTLES OF 10 C.C.

*The word "Pituitrin" identifies the extract of the posterior or infundibular portion of the pituitary gland, manufactured by Parke, Davis & Co. The activity of Pituitrin is determined by physiological tests.

A pamphlet containing further particulars will be sent to any physician, on request, by

PARKE, DAVIS & CO.,

50-54, Beak Street, Regent Street, LONDON, W.

Carnrick's Liquid Peptonoids

BEEF, MILK, and WHEAT (Pre-digested).

A Sustaining, Stimulating, and Palatable auxiliary food, rich in all the nutritive principles of Beef and Wheat (except the fat) pre-digested by Pepsin and Pancreatin; ready for immediate absorption and assimilation, especially useful for the restorative feeding of patients unable to digest food in any other form.

INDICATIONS.—In crises and exhaustion; all cases of gastro-intestinal disease; pneumonia; and as a colonic nutrient.

Of "Liquid Peptonoids" THE LANCET writes:—"A very valuable food .... a very powerful and agreeable tonic and stimulant."

THE HOSPITAL:—"Its most valuable feature is that clinically it has proved itself capable of absorption when everything else has been rejected by the stomach."

THE BRITISH MEDICAL JOURNAL:—"Readily taken and well borne, even by a very delicate stomach."

DOSE.—One or two tablespoonfuls four to six times a day.

A paper on colonic alimentation, giving the latest methods and formulæ, will be forwarded on application to the Company. To ensure a correct supply to patients, Physicians are respectfully requested to specify this preparation in writing.

CARNRICK'S "SOLUBLE FOOD" FOR INFANTS AND INVALIDS.

A Pancreatised Milk-Wheat Food.

A notable feature is the **soluble condition** of the casein, preventing coarse curdling of the food in the infant's stomach.

When made up according to directions it approximates very closely to human milk in composition and physiological properties.

It is also a valuable auxiliary food for invalids and convalescents.

Issued in 4 oz., 8 oz., and 16 oz. soldered tins.

CARNRICK & CO., Limited, 183, Acton Vale, London, W. 3.,

Will be pleased to send Samples Free of Charge to Medical Men.

Vibrona

The IDEAL TONIC WINE

VITIS VINIFERA

CINCHONA SUCCIRUBRA

Mental and Nervous Shock.

The fact that in VIBRONA the active principles of Cinchona are presented in the form of Hydrobromates, which do not occasion headache or gastric irritation, renders it of great value as a Restorative in all cases of nervous strain and in convalescence from wounds or operations. One tablespoonful is an adequate dose.

An ointment *de luxe*. Well worth bearing in mind by physicians when prescribing carbolic acid ointment. Contains 3% of pure phenol in a bland and soothing base. Fulfils to perfection all the purposes to which this ointment is applied.

Supplied in 2 oz. glass pots at 10d. each

Obtainable through all Chemists

From a valley in what is now Manchuria "there sprang a petty Tartar chieftain who challenged the power of China, and whose sons, after a determined struggle conquered the Celestial Empire and placed on the throne the present dynasty." These were the Manchu-Tartars who, through their dexterous horsemanship and skill in the use of the bow, prevailed over the Chinese, although the latter used against them the newly-adopted musket. For Manchu "quickness and nimbleness not giving them time to charge again . . . . . they presently fled which way soever they could, but being pursued by the swift Tartarian horse most of them perished." The Manchus were trained to drop the reins and guide their steeds with their heels so that both hands were free to use the bow and arrow. The bow here represented—like that of Ulysses—springs back when unstrung until the inside assumes a convex shape, a peculiarity which makes it a very powerful weapon. It is made of horn and wood with an envelope of cork in the centre. The iron-tipped arrows, whose feathers extending ten inches up the shaft are taken from eagle's wings, exceed three feet in length.

HOEFFTCKE'S EXTENSION APPLIANCES.

Ambulatory Treatment of Fracture of the Limbs; Tuberculous and Arthritic Disease of Joints.

By C. A. HOEFFTCKE,
7, Harley Street, London, W. 1.

(Continued from June 16th.)

THE following active tubercular knee case was described and illustrated, with splint applied, in the BRIT. MED. JNL., April 16th, 1910, and also in THE LANCET, March 25th, 1911, as one of the worst which could come under any surgeon's notice. The result obtained by means of my extension splint, shown in Figs. 4 and 5, shows that even under the most unfavourable local conditions the tubercular disease can be arrested by mechanical means only, simply by preventing friction between the articular surfaces and aiding the blood supply by enabling the patient to walk about and exercise the joint.

Mr. S. (æt. 21) (see B. M. J., 1910, and LANCET, 1911) was sent to me by a surgeon of the London Hospital towards the end of January, 1910, to have my splint applied. The patient hurt himself playing football in 1906. The knee began to swell and was very painful; several abscesses formed and broke after three months. Attended to at Whipp's Cross Infirmary; admitted as in-patient December, 1906. Operated on June, 1907. Discharged December, 1907, on crutches, with the knee bent and several sinuses suppurating. Surgeon said he could not do any more and advised amputation of the leg, which patient did not consent to. Feb., 1908, introduced to surgeon, London Hospital; taken in April 7th, 1908; operated on April 9th, 1908, parts of necrosed bone taken out. Discharged July 2nd, 1908, knee still contracted; sent to Convalescent Home until July 28th, 1908. Attended out-patient department until Jan., 1910, when Hoefftcke's splint was ordered. The knee was very swollen and painful. In making the instrument I had to avoid pressure on three sinuses which were suppurating. Feb. 3rd, 1910, instrument put on; the angle of contracture was then 130 degrees. Knee straight ten weeks after, two sinuses closed up; walked very well indeed without help of a stick. Steel bar removed and elastic traction substituted, and movement in the knee allowed.

The power of extension used in this case continuously day and night on the ankle, with the tuber ischii as counter-extension, was from 10 to 15 lbs. without producing the least soreness anywhere. My splint was taken off on the 20th October, 1911, and the young man, who was promoted to the Power Station - which entails climbing ladders—has now a strong and movable knee (see Figs. 4 and 5), and an almost hopeless cripple has been made into a useful member of society.

I saw this patient some time ago and he has had no recurrence of the disease since.

FIG. 1. Mr. S. Contracture of knee-joint, T.B., with three sinuses suppurating, on crutches. Feb. 3rd, 1910.

FIG. 2. Mr. S. Knee straight; two sinuses closed up. March, 1911.

FIG. 3. Mr. S. Front view. Leg developed to normal size. March, 1914.

FIG. 4. Mr. S. Showing strength in joint while standing on bent knee and muscles developed. March, '14

FIG. 5. Mr. S Showing range of free movement. March, 1914.

(To be continued August 11th.)

Croonian Lectures

ON

ADAPTATION AND DISEASE.

Delivered at the Royal College of Physicians of London,

By J. G. ADAMI, M.D., F.R.S.,

TEMPORARY LIEUTENANT-COLONEL, C.A.M.C.

LECTURE IV.*

Delivered on June 26th, 1917.

THE PHYSICO-CHEMICAL BASIS OF IMMUNITY AND OF EVOLUTION.

MR PRESIDENT AND GENTLEMEN,—If we endeavour now to gather together the conclusions which may reasonably be reached from a consideration of the data afforded in the last two lectures they appear to be the following.

CONCLUSIONS FROM DATA ALREADY GIVEN.

I. Instead of there being no such thing as direct adaptation or equilibration of the individual to his surroundings in the Spencerian sense, this surely exists and can be demonstrated.

II. In the lowest forms of life, among the bacteria, it can be demonstrated that not only in this adaptation individual but that acquired properties of certain orders are inherited through numerous generations, even when the cause which set up the original modification has ceased to act.

III. It can further be demonstrated that the inheritance is not due to the survival and perpetuation of those individuals only which present the favourable variation. All the members of a given strain of bacteria subjected to a given modification of environment can be made to vary in the same direction and acquire and transmit the same new property.

IV. Immunisation of the higher animals is direct adaptation. There could, in fact, be no clearer demonstration of the process of direct adaptation than has been afforded by the abundant researches upon the production of immunity.

V. It is clearly proved that there are drugs and toxins which, acting on the tissues of the body, act also on the germ cells, causing modification of the latter of such a nature that the offspring resulting from these germ cells is modified.

VI. The clearest evidences of this action are in connexion with drugs and toxins which lead to conditions of defect, but acquired special susceptibility and anaphylactic reaction are also inherited, indications that new properties gained by the germ cells can also be inherited.

VII. The generative system is embryogenetically related to the endocrine system, and is profoundly influenced by the internal secretions of that system. The indications are that influences from without affecting the organs of internal secretion and modifying their secretions may, through the hormones, &c., of the internal secretions, so influence the germ cells that the offspring are affected in the same direction as the parent, and that thus acquired metabolic disturbances in the parent, whether of the nature of defects or acquirements, are capable of being inherited.

To the academic biologist the suggestion of a direct action of external agencies as the prime cause of variation is as shocking and as improper as would be the suggestion of a risqué story to some dear and prim old maiden lady. To the biologist of to-day the conclusions above noted are heterodoxy pure and simple. And yet it is along these lines that medical research is surely leading us. And what is more, these conclusions harmonise with the experiences that come to us day after day in studying our patients and their families.

WEAKNESS OF THE MORPHOLOGICAL CONCEPT.

Believing that we are in the right, where is it that the biologists have gone wrong?

I venture to suggest that, from the morphological trend of their studies, in striving to form a mental picture of the process of evolution biologists have perforce conjured up separate individual particles or molecular structures, each of which is the bearer of an individual property or group of properties. Their conceptions have perforce been in the terms of specific atomies.

We see this tendency elaborated—and, in his great sanity, cast aside—by Charles Darwin in his pangenesis hypothesis. It was exhibited again *à merveille* by Weismann with his ids, idants, determinants, and the like, pure figments of the imagination which, nevertheless, have influenced and affected all our generation. It has shown itself and been carried forward in full vigour by the Mendelians: one has only to consult their diagrams to see how obviously their conceptions and explanations assume a structural form. It is because he cannot picture in his mind an atomy, or structure, making its appearance in the germ cell, like Venus arising out of the sea foam, and henceforth becoming a portion of the hereditable substance of that cell, that Professor Bateson finds it impossible to imagine the positive acquirement of new properties by the individual, and so is driven to the remarkable hypothesis quoted in my first lecture.

But before all it is the Freiburg philosopher who has led our generation of biologists into Nephelococcygia—"Cloud Cuckoo-land." Much as we owe to him for arresting the vague generalisations upon heredity prevalent until the "eighties," and for his confirmation, experimental and otherwise, of Galton's doctrine that conditions such as mutilations and use acquirements are not inherited, I myself am inclined to think that Weismann's teaching has, on the whole, done more harm than good. He was a pure morphologist, and his hypothesis was purely morphological. Had he been familiar with the physical chemistry of his day he could not have ventured to publish it; had he been a physiologist with any appreciation of function he must have modified it extensively. It is, in short, an impossible hypothesis, and in a very extraordinary manner all its main postulates are found contrary to experience. As I pointed out nine years ago,[1] our knowledge of the size of the molecule of albuminous matter renders the existence of thousands of individual molecular determinants in the minuter portions of the nucleus a matter of sheer impossibility—they could not be packed in the space. If I remember aright, it was Herbert Spencer who pointed out that in one feather of the peacock's tail there are 480,000 regions or parts capable of independent variation, and that, therefore, so Weismannism demands, in each of the many microscopic "ids," or chromosomes, in the nuclear chromatin of the peahen's ovum there must be 480,000 determinants for each tail feather alone. How many for the rest of the body passes computation!

It is this faulty and untenable morphous or morphological concept of unit-properties and hereditary entities that makes it as difficult for Professor Bateson to picture how new accretions (whereby he images new discrete determinants) can make their appearance in the germ cell as it was for King George of glorious memory and muddled to imagine how the apple got into the dumpling.

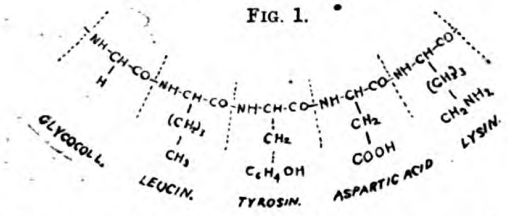
THE CONSTITUTION OF LIVING MATTER.

Suppose now we start instead from known facts and known phenomena, and endeavour upon these to build up our idea of the structure and nature of the germ cell, and so of the organic basis of heredity, variation, and evolution.

What in the first place do we know of the constitution of living matter? Will this help us? I think it will. We know that whatever form of life we investigate, be it in animal or plant, mammoth or microbe, whatever form we analyse, and whatever tissue of that form we analyse, leaving out of account water and certain common vehicular salts to which no specific vital functions can be attributed, just one order of highly complex organic compounds is common to, and to be isolated from, all forms of living beings, and these are the proteins. This characteristic universal presence of these highly complex organic compounds in itself indicates that they are intimately associated with vital functions. It is true that when we isolate them chemically they are inert—in other words, in the living organism with its many activities they are evidently present in another form; living matter, therefore, as I have expressed it elsewhere, contains as an essential constituent *proteidogenous* rather than proteid matter.

The Structure of the Proteins.

But the structure of these proteins, as worked out first by Curtius and Schutzenberger, and as more fully demonstrated



* The previous lectures were briefly summarised in THE LANCET, I., 1917, i., 921; II., 1917, i., 961; III., 1917, ii., 20.

[1] Adami, Principles of Pathology, vol. i., first edition, 1908.

by Emil Fischer through the actual synthesis and building up of bodies of protein nature in the laboratory, is highly significant. They are molecules so large that they will not pass through fine filters, giant molecules but a little below the limit of visibility under the highest powers of the microscope. Take one of the simpler crystallisable proteins —namely, hæmoglobin; its composition appears to be approximately $C_{712}H_{1130}N_{214}O_{215}Fe,S_2$; in fact, the average molecular weight of proteins has been estimated at about 15,000, or roughly one thousand times that of a molecule of water. And the hæmoglobin from each species of vertebrate is a different chemical substance: nay more, our researches in immunity indicate that there may be differences between the hæmoglobins of two members of the same family. Certainly, no two analyses of separate samples of crystalline hæmoglobin obtained from the same species give identical results. By digestion, as every board-school child knows, we break these proteins down into peptones and albumoses. By further disintegration Kossel and others have broken down these peptones and protones into their constituent amino-acids, bodies belonging to the fatty acid series—aminated fatty acids. What Fischer has done has been to manufacture these aminated fatty acids (acetic, propionic, &c.) in the laboratory, and then he has accomplished the reverse process of linking these together, until with five, ten, fifteen, and more linked together he has obtained bodies affording the chemical tests for peptones.

Now these amino-acids have one striking property—they are amphoteric: they possess both acid and basic properties:

FIG. 1.

acid, because of the contained COOH group or groups, basic, through the NH_2 group or groups. Thus we conceive these peptones as composed of polymerised molecules, formed in the main of amino-acid molecules linked together by their otherwise unsatisfied NH and CO affinities. Thus to modify Hofmeister's illustration we may represent a portion, at least, of the peptone molecule (Fig. 1).

Each section between the dotted lines represents an amino-acid nucleus. I speak of these as glycocoll, leucin, &c., but it will be seen that in the leucin nucleus, for example, an H of the NH_2 group is replaced by the CO of the glycocoll nucleus, and the hydroxyl of the COOH group by the NH of the tyrosin nucleus. In Fischer's terminology the nucleus is leucyl, not leucin. The peptone molecule is thus represented as composed of a main chain in serial repetition of glycocoll molecules—

$$(H) - NH.CH.CO - (OH)$$
$$\quad\quad\quad

inherits either from the male or from the female parent. The conclusion is inevitable that the biophoric molecules are conveyed in and by the nuclear chromatin. In the bacteria which are so lowly that they possess no central nucleus, we observe, nevertheless, that chromatin-like granules are scattered through the body substance, and that in binary division these chromatin-like granules undergo a certain simple accumulation or arrangement, to the end that each of the daughter cells is endowed with half of this specific chromatin-like material.

FIG. 4.

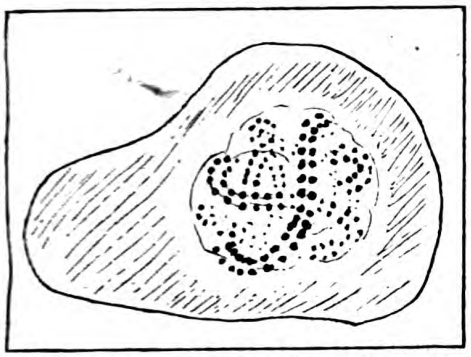


Diagram of cell showing beginning of nuclear mitosis: "skein" stage, the thread formed of a double beaded row. Each bead is one of the "chromomeres" referred to in the text (Weismann's "ids.")

Or otherwise, whereas in these lowest forms the living cell substance is made up of granules of chromatin, each surrounded by an area of cytoplasm, higher up in the scale these granules of biophoric matter are collected into a central node—the nucleus—which is separated from the circumambient external medium by the cytoplasm or cell-body. We may, indeed, speak of a triple protection—namely, the cell-wall or membrane, the cytoplasm, and the nuclear membrane, all of them, on the whole, acting as conservative agents, tending to preserve the biophores from sudden change from without. (Fig. 4.)

Vital Processes of the Cell.

But to continue, as it were, to rehearse our catechism, while on the whole conservative, this system is exposed to constant change, owing to the fact that it is not inert but is constantly reacting with that external medium, receiving matter from the same either (1) in bulk (phagocytosis), or (2) by diffusion, or (3) by surface absorption, and discharging other matter into the same (excretion). And if we study carefully these processes of assimilation and discharge it is to be made out that the outer cell membrane is semi-permeable, preventing the entrance of certain substances, permitting the entrance of others, whether directly, or after a preliminary dissociation of the same into simpler molecules by means of its extracellular secretions. And once these foodstuffs are taken into the cytoplasm, there again they are, if necessary, broken down still further into yet simpler molecules by intracellular enzyme action.

It is being more and more surely established that these enzymes are of nuclear origin, resulting from the discharge of certain constituents from the nuclear substance, but this is not a necessary part of my argument. The essential point is that the foodstuffs, protein, carbohydrate, and hydrocarbon are not utilised by the cell as such, but are dissociated, and it is these disintegrated and dissociated molecules that are utilised by the cell in one of two ways—either to supply energy for the performance of work or, on the other hand, for growth.

The Nature of Growth.

I feel almost apologetic for taking up time over such elementary matters. And yet these are matters that, while absolutely basal, are absolutely neglected by ordinary biologists. Take, for example, this matter of growth. With all the extraordinary width of his learning D'Arcy Thompson has just achieved a work of some 750 octavo pages on "Growth and Form," full of most interesting observations and data, and with a distinction of style that is a pure delight, but with little more than a page devoted to the essential nature of growth of living matter, and that page upon the text that the older naturalists laid stress upon the fact or statement that inorganic bodies (crystals) grow by agglutination, organic bodies by intussusception. The living cell, he states,[4] grows very much as a piece of glue swells up in water, by "imbibition" or by interpenetration into and throughout its entire substance. From his statement growth might be nothing beyond the absorption of water by a semi-fluid colloid mass. Now one has only to consider a moment to see that "intussusception," "imbibition," "intercalation" are nothing more than bald and blank terms. They are inane; they cannot possibly explain how two molecules of living matter appear where there was but one before, two grains of wheat where one was put into the ground. Growth is one of the great underlying phenomena of living matter, and zoologists and botanists have in a simple Topsy-like manner been satisfied that the phenomenon occurs, and have been amply content to rest with the demonstration of the stages of mitosis and cell division.

But what has happened to the cell substance that precedes and impels mitosis? Obviously there is an increase in the amount of living matter, and this translated into physical terms means a multiplication of the molecules of living matter, or, as I term them, the biophores or biophoric molecules.[5] If we regard these complex proteidogenous molecules as a chain, or more simply as a ring of amino-acid radicles, there is but one way in which this can multiply—namely, by the same method as obtains in the growth of a crystal. Let us take the simplest case, that of the crystallisation of sodium chloride out of watery solution. We know that when the solution or dilution of the sodium chloride reaches a certain point the salt separates into its constituent ions of sodium and chlorine. But while separated these maintain a certain relationship or association. It is remarkable that the chlorine ions do not escape or volatilise into the air. When the concentration of the solution reaches a certain point each ion of chlorine unites with a corresponding ion of sodium, and, aided by a sharp point or inequality of the surface of the containing vessel, the process of crystallisation begins. The very existence of one crystal is seen to cause other junctions to occur in its immediate neighbourhood, and, indeed, just that one series of junctions necessary to form sodium chloride. Despite the presence of other salts in solution, we gain pure, or almost pure, crystals of the one substance. We have in this way growth of solid sodium chloride.

Growth of living matter, if more complicated, because the structure of the biophores is more complicated, must nevertheless be of the same order. Its nature is best suggested by the following diagram:—

FIG. 5.

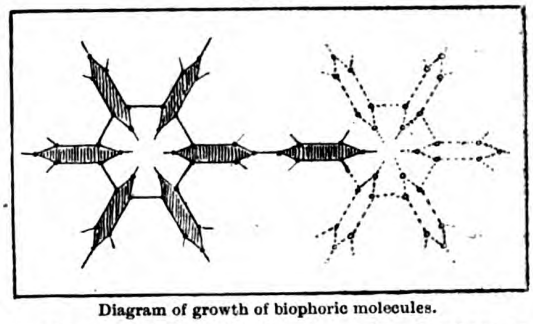

Diagram of growth of biophoric molecules.

—namely, granted that the already existing biophore finds itself in a medium—the nuclear cell sap—containing the necessary radicles, should that by one of its attachments attract to itself one of its component radicles there is then started a process by which, in orderly sequence, the other radicles become attached until there is built up a compound molecule, identical with the pre-existing molecule, in association with which it has become developed.

This conception—namely, that the growth of the biophores or otherwise of the molecules of living matter is essentially of the same nature as is that of crystals—is materially aided by the recognition that crystallisation does not of necessity demand the production of rigid rectilinear figures; that, as

[4] Growth and Form, Cambridge University Press, 1917, p. 203.

[5] I employ this term, introduced by Weismann, rather than manufacture a new term, because our fundamental conception is identical, although it is necessary to point out that our ideas as to the constitution of the biophores do not entirely harmonise.

Lehmann[6] was the first to point out in 1904, there are in nature abundant examples of fluid, non-rigid, crystalline forms, and as Aschoff and I were the first to note[7] in 1906 the animal organism affords abundant examples of these fluid crystals. As D'Arcy Thompson well remarks,[8] "the phenomenon of liquid crystallisation does not destroy the distinction between crystallisation and colloidal forms, but gives added unity and continuity to the whole series of phenomena."

REVIEW OF SOME CONCLUSIONS LED TO.

But if we accept these views regarding the existence of biophoric molecules and the essential nature of growth as involving a multiplication of the same by a process akin to crystallisation, we are inevitably led to certain very interesting conclusions which may here be rapidly passed in review. Each, it is true, might well be expanded into a chapter, but the limitations set by this course of lectures demands that I do little beyond indicating the headings.

1. *The Continuity of the Germ Plasm.*

Weismann conceives his biophores and determinants as handed down direct from parent to offspring, so that the germ plasm of a thousand generations back is contained in the germ cells of the generation of to-day and has its influence upon the configuration of the body of the individual derived from those germ cells. This he speaks of as the continuity of the germ plasm.

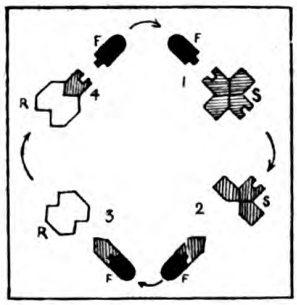
But, obviously, this is not a continuity of substance, as Weismann implies, but merely a potential continuity of molecular arrangement and constitution. For growth and multiplication of the living molecules, for one conjugated ovum and spermatozoon to give rise to the countless millions of sperm cells of the male of any of the higher animals[9] there must be such active reproduction of the parental biophores that the chance of one of the original biophores of a grandparent finding itself in the nucleus of a sperm cell must be infinitesimal. The likelihood is that while such, it is true, control the constitution of the new biophores they sooner or later, in the metabolic processes of the cell, become dissociated and broken down.

2. *On the Functional (Katabiotic) and Vegetative (Bioplastic) Activities of the Cell and the Individual.*

In unicellular organisms the growth of the individual presents itself merely as increase in size; in multicellular organisms, while there may be increase in size of the component cells to a certain extent, growth is brought about in the main by cell proliferation and increase in the number of the component cells. But both in protozoa and metazoa (and protophyta and metaphyta, if the terms be permissible) there are limits to this process. Here I would but rapidly refer to what constitute these limits—namely, they are conditioned by the relationship or interaction between the individual and its environment. Broadly speaking, the individual continues to grow until an economical mean is established between the amount of foodstuffs afforded by the environment and the absorptive surface that the individual can present to that environment. It is, as I have pointed out, a false conception to regard the multicellular organism as a colony of individual cells which remain united for self-defence and mutual advantage. Rather it must be recognised that where the unicellular mass of protoplasm undergoes enlargement the greater the mass the smaller relatively becomes the surface area, and this diminution proceeds in a rapidly increasing ratio, until growth is arrested by the fact that the amount of foodstuffs absorbed cannot keep pace with the needs of the organism. Nuclear and cell division and multicellularity constitute the simplest mechanism whereby the nuclear and cell surface areas can be increased in a yet greater ratio, and the greatest effective working of the individual obtained by decentralisation; whereby we may regard the mass or size attained by the mature individual of any species as representing the sum total of protoplasmic matter of the constitution peculiar to that species, which is capable of existing as an entity under the particular conditions of its environment, the multicellular individual acquiring its greater size and more complex activities by means of nuclear followed by cell division.

In either case, whether in the unicellular or in the multicellular organism, the individual continues to grow and exhibit predominantly vegetative activities until it reaches this limit of economical relationship between itself and its environment. In the very earliest stages the vegetative activities alone are evident; as the above-mentioned limit is approached these become less and less, and the cells are more and more engaged in functional activities—that is to say, they utilise the foodstuffs received, not in building up more living matter, but for the performance of work and liberation of energy. And to the extent that growth necessitates a building-up process from the foodstuffs presented to the cell, and function necessitates a breaking down and burning up[10] of the same foodstuffs, to this extent the vegetative or—as Weigert terms them—bioplastic, and the functional or katabiotic activities are opposed processes.

3. *Metabolism.*



It may be thought that in mentioning these matters I am wandering far afield, and through a singularly arid field at that—nay more, that I do but touch upon or outline matters which to be grasped in all their bearings need a much fuller presentation. I touch upon them purposely in order to emphasise that these matters of adaptation and evolution have of necessity to be approached from the aspect of function and the dynamics of living matter, rather than from the point of cell statics. "Function," it has been said, "precedes structure," and it is the study of cell function that must afford the key.

If next we proceed to inquire into the state of our knowledge of the chemistry of these active processes occurring within the cell we reach a further stage, for the more we study the processes of absorption of food and utilisation of the same—the metabolic processes, whether, as Gaskell termed them, of anabolism, building up, or katabolism, breaking down—the more it is borne in upon us that the greater number—some would say all—are the outcome of enzyme action.

4. *On Enzyme Action.*

This is not the place to discuss the nature of enzyme action in detail. For the most authoritative reading upon the subject Professor Bayliss's works should be consulted. Suffice it to say that the simplest and now generally accepted view is that there exist in the cell and are discharged from it intermediary bodies—katalysts—which promote and hasten chemical dissociations and associations without themselves being involved in the final stage, and that the simplest diagrammatic representation of their action is as indicated in the diagram (Fig. 6), in which F represents the go-between, the body endowed with enzyme action, S the substratum, or body which undergoes dissociation, and R the receptor, or body which is aggrandised, with which the dissociated moiety or part of the substratum enters into union. There are, I hold, always these two phases of dissociation and association in each instance of ferment activity, even if F be but a hydrogen or hydroxyl ion. The process is comparable with the katalytic process of manufacture of concentrated sulphuric acid from sulphurous anhydride, through the agency of nitrous acid. The nitrous acid, HNO_2, takes up a molecule of O from the air, becoming nitric acid, and acting as carrier, gives this over to the sulphurous anhydride H_2SO_3, converting this into sulphuric acid H_2SO_4, with this becoming free itself to take up another molecule of oxygen and repeat the process with another molecule o

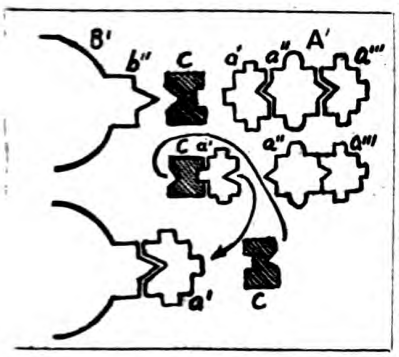
[8] Loc. cit., p. 204.

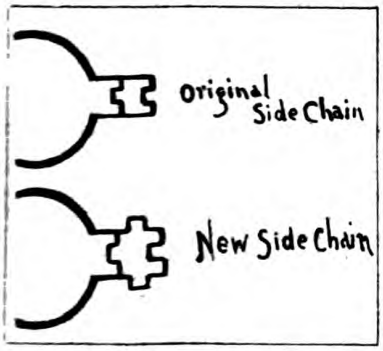
[9] According to Loeb the average seminal ejaculation in man contains 226,000,000 sperm cells.

[10] It is not (as one is apt to imagine) the dissociation of the foodstuff that liberates energy, but the burning up of the same—i.e., the oxidation of the dissociated foodstuffs.



sulphuric anhydride. And the process continues until a certain equilibrium is reached between the amount of anhydride and of sulphuric acid present, unless the H_2SO_4 be removed so soon as formed, in which case eventually a trace of nitrous acid can convert a maximum, or theoretically infinite, amount of anhydride. And this action is, under certain conditions, reversible.

FIG. 7.

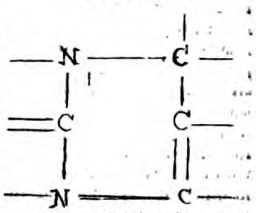


Now, as I have already stated, the evidence is conclusive that none of the ordinary foodstuffs—the proteins, carbohydrates and fats, are utilised by the living cell as such; through enzyme action, whether extracellular or intracellular, they are broken down into simpler substances, into their component radicles. The evidence is accumulating yearly more and more that, if not the enzymes themselves, at least the zymogens, the bodies from which the enzymes are derived, originate in, and are discharged from the nucleus, the dynamic centre of the cell. Already there is evidence that certain of the amino-acids, and it may well be of groups of conjugated amino-acids, constituting Fischer's polypeptids, manifest enzyme action. Their amphoteric constitution in itself favours the possession of these properties.

FIG. 8.

We can visualise the process thus: Let A (Fig. 7) represent a peptone or polypeptid molecule of foodstuff small enough to be absorbed or diffused from the external medium into the cytoplasm of the cell. This may either (1) be broken down into simpler radicles, a' a'' a''', and those radicles utilised by a direct dissociation process for the growth of the proteins of the cytoplasm or, it may be, the nuclear biophoric molecules themselves (B), through an unsatisfied linkage exercising a stronger attraction for certain of the constituent radicles of A, such as a', in which case a' becomes part and parcel of B and a'' and a''', whether combined or loosened, are left free in the cytoplasm; or (2) where the conformation (that is to say, constitution) of A and of B (or better A′ and B′, Fig. 8) is not such as to permit of this direct attraction and linkage, it may happen that free radicles suspended in the cytoplasm may possess the necessary linkage, and in that case these will act as catalysts or enzymes, first attracting away to radicle a' from A′, and then in turn by superior attraction being impelled to give it up to satisfy the linkage b'' of B′.

FIG. 9.



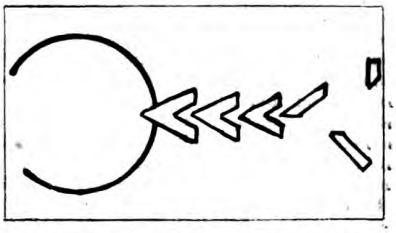
5. *Possibilities Arising out of Above View of Enzyme Action.*

But if this conception and visualisation of enzyme action approaches the fact, do you see where it leads us? I am not going to take up all the lines of thought and possibilities opened up by this conception, but only those bearing directly on my theme.

(1) In the first place the remains of A left free in the cytoplasm, if of amphoteric type, may in itself act as a catalyst.

(2) In the second we are given an understanding of the mechanism whereby foreign proteins may be utilised by the cell. Those proteins are complexes with multiple linkages: they are composed of combinations of the various amino-acids, and the number of amino-acids is limited. It is, therefore, inevitable that enzymes, whether extracellular or intracellular, will loosen and detach certain of the radicles, thus dissociating the protein and affording foodstuffs capable of being utilised by the cell. But doing this, to take the simplest case, the relative numbers of molecules of the different amino-acids presented to the cell and to its nuclear biophores will differ from the normal, and, if the exhibition of the foreign protein continues, so gradually will there be developed a tendency for the proportion of the radicles constituting the biophoric molecules to vary, those deficient in number being replaced by those that are abundant.

FIG. 10.



The pyrimidine ring.

Or, again, the simpler complexes due to the breaking down of the foreign protein may not be identical in constitution with those which prior to the exhibition of the foreign protein had been attracted to, and had constituted certain particular side-chains of, the biophoric molecules. In this way, again, the constitution of the biophores may become altered. This we may visualise as shown in Fig. 9.

I would recall how a slight difference in the relative attachments of the side-chains, say of the pyrimidine ring (Fig. 10), alters the chemical properties of the compound; in like manner what may appear to be but a slight modification in the constitution of a biophoric side-chain may be expected to lead to material differences in the reactions of the whole molecules—that is, in the case of germinal biophores—of the individual.

(3) One more postulate needs to be laid down. You will remember how I pointed out in my second lecture that the introduction of toxins, whether phytotoxins like abrin or bacterial toxins like those of diphtheria and tetanus, lead to the abundant if not over-production of antitoxins on the part of the cells.

FIG. 11.

The simplest explanation of this continued production is that when the toxin (which has all the properties of an enzyme) enters the cell it combines with and detaches certain side-chains. Whether the cell in consequence becomes destroyed or, on the other hand, succeeds in neutralising the toxin depends upon two factors—the number of toxin molecules that gain entrance and the rate at which the cell can reproduce the lost side-chains. Just as a damaged crystal, if placed in a saturated solution of the particular salt, repairs itself so we have to assume the capacity on the part of the living molecules to build up lost parts. So long, that is, as the toxin in the cytoplasm acts as a catalyst detaching the particular side-chains for so long will the molecular complexes build up side-chains until from the law of habit the function of formation of this particular order of side-chain in excess of the previous needs of the cell becomes established (Fig. 11), continuing even after the toxin has become either used up or discharged from the cell.

6. *Cell and Tissue Differentiation: Ontogeny.*

With this clear indication, therefore, before us of the way in which the cell substance can become modified and adapt itself according to need, it is not necessary, with Weismann, to postulate the existence of two orders of living matter, *germ plasm* and *somato-plasm*. It suffices to hold that there is one common biophoric material—or, at most, biophoric material in part derived from one, in part from the other parent—and to recognise that as the fertilised cell divides and re-divides and the resultant cells find themselves in different relationships so do they become modified and differentiated, giving origin to the various tissues, the eventual germ cells being so developed and so placed that they are exposed to the minimal amount of differentiation.

If embryogeny, or more exactly ontogeny—the development of the individual—is a recapitulation of the phylogeny—of the evolution of the race—it is this not as an historical reminiscence. It is this only so far as it is a necessity, only so far as, for the unfolding and elaboration of the cell structure of the various tissues up to the stage in which the adult of a particular species will find itself in equilibrium with its surroundings, the biophores distributed to those cells must of necessity in the course of their growth and multiplication pass through a particular succession of modifications, of accretions and losses, the one phase inevitably leading to the next. Where a given modification can be attained by a short cut there certain phases of the phylogeny fail to be recapitulated. In short, the development of any particular tissue may aptly be compared with the synthesis of one of the higher organic compounds. That cannot be accomplished by taking so much carbon, hydrogen, nitrogen, &c., mixing and heating them together, but demands a long process of building up—it may be a score or more successive processes of combinations, associations and dissociations—before the final product is attained; the constant endeavour of the chemist being to simplify the process, to arrive at the same results by finding some reaction which will cut out half a dozen or more of the steps and lead more rapidly and more economically to the same result.

7. *Amphimixis.*

This mention of the contribution of the two parental germ plasms to the fertilised germ cell, or zygote, leads to certain important considerations. If the metabolic activities of the cell are of the order here stated, and if, as is evident from the studies of cytologists and embryologists, equivalent amounts of heritable material—or biophores—from the two parents reach the zygote and, in the subsequent process of active cell division of the embryo, are contributed to each cell—i.e., to each cell nucleus—again the static conception cannot be permissible. We must realise that these two orders of biophores, existing in each cell of the body and activating each cell, are throughout life undergoing growth, building up side-chains and radicles, and that there is a constant recurrence of processes of association and discharge from each molecule out of, and into, the nuclear sap. But if this is the case, and the two orders of active living molecules lie side by side in the fluid medium of the nucleus, it is impossible to imagine, according to the current Mendelian doctrine, that the two do not interact one upon the other, that the two orders of side-chain substances and dissociation products keep severely apart. We may safely say that there must be interaction: that where radicles and groups of radicles built up by biophores of the one order become dissociated from those biophores, if of an order common to both paternal and maternal biophores, they may be employed indifferently in the building up and growth of biophores of both orders; if of an order peculiar to, say, the paternal biophores, they may under certain conditions be attracted to and built into the growing maternal biophores. We can imagine environmental conditions favouring the predominant growth of just the one group of biophores so that the cells of some one tissue take on the characters of the cells in the one parent, or, more easily, in actively working tissue cells, such an interchange and selection of allelomorphic radicles that eventually one common type of modified biophoric molecule may govern the cell.

And at a slower rate due to their more latent state, this same interchange, we must predicate, is capable of occurring in the biophores of the germ cells, so that eventually a succession of heterozygous generations will give rise to forms without the pure dominant gross characteristics, but showing an approximation to intermediate properties[11]; or, again, eventually, the interchange of radicles may be such that the various dominant radicles belonging to both orders of biophores be attracted to, built into the growing molecules and reproduced by the biophores of one parental origin—whereas the biophores of the other origin in their growth may show a greater affinity for the radicles whose constitution leads to the appearance of recessive qualities.

The existence of determinants as entities, as I have demonstrated, cannot on physical grounds be accepted, and if in their place we accept differences in the constitution or arrangement of individual radicles composing essential portions of the combined and complex molecules of living matter, it is still possible to interpret the facts of Mendelism, and, indeed, interpret not a few phenomena which by the hypothesis of determinants cannot be explained.

SUMMARY OF HYPOTHESIS.

However, I realise that, addressing medical men, here I advance into regions outside the boundaries of current medical thought. To sum up, it may be said that, according to this hypothesis, each species must be regarded as having for its essential living matter a distinct organic compound, a compound as distinct as any inorganic salt, but differing from that simpler inorganic salt in that, whereas the central ring or chain is of fixed constitution, the radicles composing that ring or chain are capable of attracting, and then of reproducing a series of side-chains which may vary, so that within the species there may be various strains, just as we may speak of various strains of crystalline hæmoglobin being obtained from different samples of human blood.

Let me freely admit that the diagrams here afforded have been very crude. With the necessarily condensed presentation of my subject they have seemed to me essential. To those unfamiliar with the advanced organic chemistry of to-day, to have attempted illustrations of the successive stages of my argument by elaborate graphic chemical formulæ would have been worse than useless. I shall be satisfied if I have rendered it clear that it is possible to replace an impossible hypothesis based upon supposititious, independent, and transposable determinants by one based upon what we know of the composition and physical structure of the main and outstanding constituent of living matter—the proteins—a hypothesis that renders it possible for us to understand how digestion or, more broadly, metabolism, is the keynote of the whole matter; how through this universal system of dissociation of foodstuffs into their elemental radicles it is possible for the cell to utilise and accustom itself to new and foreign foodstuffs; how doing this, the constitution of the living molecules may become altered; and how Professor Bateson's incapacity to comprehend the possibility of progressive acquirements by the individual and his germ cells is due to his static method of approach to the subject. To one who regards life, not from the morphological point of view, in terms of form, but from the physiological, in terms of function—who regards life as a moving equilibrium, who regards it as in essence "a state of persistent and incomplete recurrent satisfaction and dissatisfaction of ..... certain proteidogenous molecules," and metabolism as the primary and basal characteristic of living matter—for such an one there exists no such stumbling block.

Progressive Accretion of Properties.

Just as Weismann's hypothesis of heredity breaks down owing to the sheer physical impossibility of all the determinants it demands being packed into the microscopic nuclear chromosome, so the Batesonian hypothesis of backward evolution by the progressive removal of inhibitory factors, like the baseless fabric of a vision, fades into nothingness once it is confronted with the demonstration that positive, direct acquirements can surely be brought about. Both hypotheses, indeed, enter into the limbo of the past, as examples of the Spencerian tragedy—that of a deduction destroyed by a fact.

I imagine that it will be your experience—it certainly has been mine—that it is those whose gentle birth is least obvious and genealogy most dubious, those who hang on to t

[11] As in Correus's observations upon the hybridisation of the t strains of *Mirabilis jalapa, alba* and *rosea*, in which the heterozygotes the F. generation are not of strong dominant rose colour, but of a pa dilute pink.

border-line of good family, who most vaunt themselves regarding their descent. They do not realise that in these days it is a man's ascent that ennobles him, not his descent, even if, paradoxically, ascent is not possible without good rich blood: it is the progressive accretion of properties, not the progressive loss. But, suggests Professor Bateson, in nature it is the opposite: it is by the progressive loss of properties that from being an amorphous mass of protoplasm man has become man. Life, according to him, first appeared upon earth enshrined in matter of maximum complexity, so complex that it was without form and void, and only as through the vast æons of geological time, this matter fell into order and simplified itself, and successive species developed, did we eventually in these latter days arrive at that simplest and least complex of all creatures, man—simple man.

Does it not appear to you that this is topsy-turvydom? Is it not, on the face of it, more probable that the reverse has been the case—that the earliest matter that could be recognised as living was the simplest. It is not that the earliest living matter possessed all the determinants of all the organised parts of all future forms of life, but that its constitution was such that it possessed, in consequence of its metabolic activities, the potentiality to undergo progressive modifications of that constitution, which modifications manifested themselves, as an outcome, in progressive changes of structure. *The potentiality was there, not the determinants.*

CONCLUSION.

One last word. I feel that, as one on active service, some apology may be required from me for having taken your time and, it may be said, my country's time, in dealing in the course of these four lectures with a matter so wholly foreign to the war, to military medicine, and military duties. Were what I have placed before you wholly new, had I collected, thought out, and elaborated the material of these lectures during the two years since I received the invitation to deliver the course, an apology would, I think, rightly be in place. As a matter of fact, these lectures are little beyond what I have taught and written in the 15 years and more preceding the war; they are a digest and compend of those earlier writings and conclusions, brought up to date by means of an occasional modern instance confirmatory of that earlier work. Fours hours ago, at lunch time, in order to complete my bibliography, I went to the library in Wimpole-street and took out the volume of the *British Medical Journal* for 1901, containing an address delivered by me at Brooklyn, New York, in May of that year.[12] That address I had not looked up for a decade or so, and it was not with a little surprise that I found laid down there the physico-chemical conception of inheritance here given, and the doctrine of direct inheritance of metabolic conditions, such as gout and of disturbances of the internal secretions. Rather, therefore, the apology should be that I have plagiarised myself in so wholesale a manner. I shall, however, be satisfied if in these Croonian lectures it is demonstrated that the work of medical men of this generation, of pathologists and bacteriologists, work founded upon the observations and methods of the great biologists of the past, is repaying the debt to biology by establishing principles which are basal for general biological advance.

[12] Brit. Med. Jour., 1901, i., 1317.

AN INDIAN CIVIL MEDICAL SERVICE.—The desirability of a separately recruited Indian Civil Medical Service, lately considered by the Royal Commission on the Public Services in India, has been decided in the negative, at all events, for the present. The general feeling in India appears to be that the question will arise in an acute form after the war. Numbers of civilian medical officers are now employed in important if not very lucrative civil surgeoncies.

A SCHOOL OF MASSAGE.—University College Hospital, Gower-street, W.C., and the National Hospital for the Paralysed and Epileptic, Queen-square, W.C., have appointed a joint committee to manage a school of massage and allied treatment on behalf of the two hospitals. The school is situated in Queen-square, Bloomsbury, and has been named the National Hospital and University College Hospital School of Massage and Electrical Treatment. The curriculum will include the teaching of massage, remedial exercises, and medical electricity, and it is expected that the first term will commence early in October. There is a comfortable hostel in connexion with the school for the use of students who desire to be resident.

PURULENT BRONCHITIS.

A STUDY OF CASES OCCURRING AMONGST THE BRITISH TROOPS AT A BASE IN FRANCE.

BY J. A. B. HAMMOND, M.B. LOND.,
LIEUTENANT, R.A.M.C.; MEDICAL OFFICER, —— GENERAL HOSPITAL;
WILLIAM ROLLAND, M.D. GLASG.,
CAPTAIN, R.A.M.C.; PATHOLOGIST, —— GENERAL HOSPITAL;
AND
T. H. G. SHORE, M.B. CANTAB., M.R.C.P. LOND.,
LIEUTENANT, R.A.M.C.; OFFICER IN CHARGE, MORTUARY, —— ADMINISTRATIVE AREA.

THE numerous cases of purulent bronchitis which have arisen at one of the bases in Northern France during the winter of 1916–17 have presented features of marked clinical and pathological interest. Patients suffering from this unusually fatal disease present a symptom complex so distinctive as to constitute a definite clinical entity. The results of bacteriological and post-mortem examinations tend also to support this belief. The earlier cases were admitted during December, 1916, but it was not until the end of the following January, when exceptional cold prevailed, that the disease assumed such proportions as to constitute almost a small epidemic. Later, when the frost abated, there was a very striking diminution in the number of cases.

The disease has been very fatal. This is shown most readily by post-mortem records referring to this period. During February and early March, while the outbreak was at its height 45 per cent. of the necropsies in this area showed the presence of purulent bronchitis.

It is proposed to discuss this condition from three standpoints: (1) that of the clinician; (2) that of the bacteriologist; and (3) that of the morbid anatomist.

1. THE CLINICAL ASPECT.

Clinical types.—The cases which came under our notice can be divided broadly into two types.

The first and more acute presents a clinical picture which closely simulates ordinary lobar pneumonia with a sustained temperature of about 103°, and expectoration at first blood-streaked—rather than rusty—which, however, rapidly becomes quite purulent. The pulse-rate in these cases is out of all proportion to the temperature in its rapidity. Dyspnœa and cyanosis are prominent features. The patient usually dies from "lung block," resulting in embarrassment of the right side of the heart on the fifth or sixth day. For the last day or two there is often incontinence of the fæces, due, no doubt, to the condition of partial asphyxia. The mental state is one of torpor; delirium is the exception.

The second and less acute type is marked by a more swinging temperature with a range of 2° or 3°. The expectoration at first may be frothy and muco-purulent, but it very soon assumes the typically purulent character. This form may run a long course of from three to six weeks, during which time the patient wastes a great deal and has frequent and profuse sweats; indeed, at a certain stage the illness is most suggestive of acute tubercular infection, and it is only by repeated examination of the expectoration that the clinician can satisfy himself he is not really overlooking a case of acute pulmonary tuberculosis. The majority of our cases conforming to this type have ultimately recovered, but the convalescence is slow and tedious.

Detailed Symptomatology.

Onset.—Whilst a history of a previous catarrhal condition lasting for a few days is often obtained, the disease quickly assumes an acute character; we have been able to observe this in patients admitted in the first instance for a surgical condition. Taking the average readings from the charts of patients admitted into this hospital with purulent bronchitis, we find the temperature is between 102° and 103°, the pulse 120 or over, and the respiration about 35. The patient frequently complains of shivering and looks pathetically miserable, but we have not seen an actual rigor. Despite his obvious shortness of breath, the sisters have noticed that, at any rate at first, he prefers a lateral position low down in the bed, and resents any attempt to prop him up.

Cough.—This for the first day or two may be irritable and distressing with a little frothy expectoration, but as the latter becomes more purulent the cough is less troublesome,

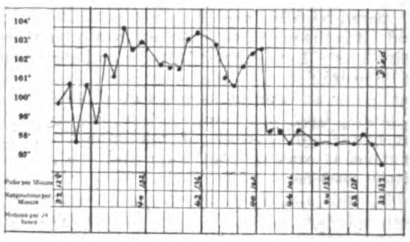
and soon the patient is expectorating easily and frequently until the latter stages are reached; when owing to increasing asphyxia the patient becomes more and more torpid, the cough subsides, and hardly any secretion is brought up. This failure becomes an added factor in bringing about a rapidly fatal termination.

Expectoration.—The sputum, with its yellowish-green purulent masses, is very characteristic, and may be one of the first indications of the serious nature of the illness the patient is suffering from. A fuller description follows in the bacteriological section.

Temperature.—The fever of this complaint does not follow any very constant type. In nearly all our cases the pyrexia was of sudden onset, and for the first few days was more or less sustained at about 103°. Later it conformed more to the swinging type with a range of several degrees. In a few cases a curious gradual ante-mortem drop has been observed. The accompanying charts demonstrate this point. (See Charts 1, 2, and 3.)

Pulse.—Tachycardia is a very constant feature throughout the illness. The rate is frequently well over 120, though the volume may remain surprisingly good until immediately before death.

Some degree of dyspnœa is always present, and is usually progressive, though towards the end in the fatal cases when the mental acuteness is dulled by the increasing asphyxia the patient is not distressed by its presence. In some cases there have been paroxysmal exacerbations of the breathlessness, accompanied by a state of panic, in which the patient struggles wildly and tries to get out of bed in order to obtain relief. Cyanosis is another prominent feature throughout the illness. At first it may not be more than duskiness, but in the later stages it becomes very evident. It is only slightly relieved by oxygen; this, no doubt, is partly explained by the difficulty in giving the oxygen efficiently owing to the patient's objection to any mouth-piece that fits at all tightly and partly by the blocked condition of the bronchioles interfering with the absorption of the oxygen.



Physical Signs.

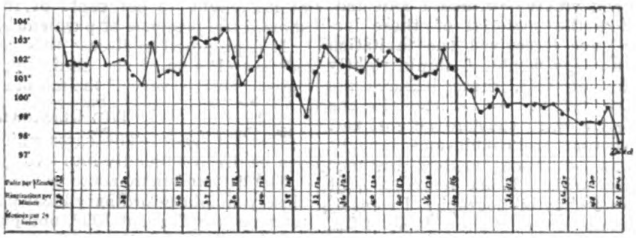
The condition usually begins with the presence of a moderate number of sharp crepitant râles, often first heard in the region of the root of the lung; these quickly become generalised. In the majority of the cases signs of broncho-pneumonic patches can be made out; these are generally situated near the root of the lungs. In a certain number of cases these patches spread and become confluent, giving practically all the physical signs of a lobar pneumonia. As the disease progresses the air entry is diminished; on listening one is often struck by the small volume of sound heard. The resonance of the lungs may also be lessened. A slight pleuritic rub was heard in a few of our cases, but this was soon masked by the bronchitic signs.

Treatment.

The treatment of this condition is not satisfactory. So far, in the worst cases, we have been unable to find anything that has any real influence on the course of the disease.

CHART 1 (Private M.).

Shows the temperature course in the more acute type of case. The temperature ends by crisis, but the pulse-rate remains high and the symptoms (cough, dyspnœa, &c.) persist. Death occurred in this case two days after the crisis. *Bacillus influenzæ* isolated in this case.



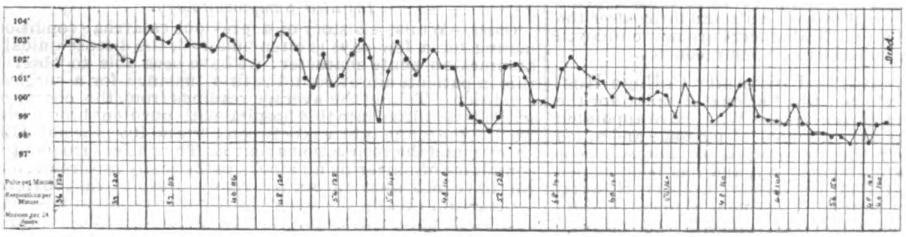
Inhalations of steam with eucalyptus, tinct. benzoin. co., &c., seemed to give considerable relief, and in order to make this as continuous as possible we have recently treated our more urgent cases in a steam tent with encouraging results. The cough is rendered less troublesome, and the expectoration being kept less tenacious is more easily expelled, a most important point, for once the patient ceases to bring up the purulent secretion he quickly goes downhill, becoming more and more cyanosed with right-sided failure of the heart.

The results obtained from oxygen are disappointing, the relief being slight and very transitory. We have already mentioned our explanation of this observation.

Venesection has likewise failed to benefit the patient for more than a very short time, though possibly we have not resorted to this treatment sufficiently early.

For drugs we have chiefly relied on digitalis and iodides with other expectorants. In the last stages, when the patient has ceased to expectorate, atropine given hypodermically has given temporary relief. Adrenalin has also assisted to prolong life. Pituitary extract increased the incontinence so many of our patients suffered from towards the end, and for this reason probably did more harm than good. Strychnine and camphor in oil were also tried, but without any marked benefit. A suitable vaccine may be shortly forthcoming, but up to the present we have not been able to give this line of treatment a fair trial.

CHART 2 (Private C.).



A less acute case than the preceding. Note the prolonged, rather swinging temperature and the fall by lysis without diminution of pulse-rate just before death. *Bacillus influenzæ* isolated.

2. BACTERIOLOGY.

Since the outbreak of the epidemic of purulent bronchitis with which this investigation is concerned 20 specimens of sputum have been submitted to the laboratory for bacteriological examination. These have all been taken from cases which in their clinical aspect differed from cases of ordinary bronchitis, and most of which presented many of the signs and symptoms described in another part of this paper. In 4 of the cases the sputum examination was supplemented by an examination of pus taken post mortem from one of the

CHART 3 (Private B.).

his shows a course similar to that of the preceding case but of longer duration. The ante-mortem fall of temperature is again very marked. A Gram-negative bacillus resembling *Bacillus influenzæ* present in large numbers in films, but *B. influenzæ* was not isolated.

smaller bronchi. In most of the fatal cases a histological examination of the lungs and other organs was made, while in 3 of them an unsuccessful attempt was made to obtain a growth from the enlarged bronchial glands. Certain animal experiments were also made in 3 of the cases; these will be described later.

Sputum Examination.

In each case, after noting the naked-eye appearance of the sputum, films were made and stained by Gram's method and a portion was afterwards plated out on blood-agar or trypsin-broth-legumin-agar.

Character of sputum.—This is in nearly every case markedly purulent. Usually no mucus is present, but in some cases the sputum is muco-purulent. The colour is yellow or greenish-yellow and the consistence thick. Usually it has a nummular character. No blood has been observed in any of the specimens submitted. There has been no appreciable odour.

Examination of films.—In all but three of the cases direct examination of films of the sputum showed the presence of more than one organism. In 18 of the 20 cases there was present a small Gram-negative cocco-bacillus, which was afterwards identified as the *Bacillus influenzæ*. This occurred as a rule in typical clumps consisting of large numbers of bacilli. The individual organisms appeared sometimes as minute elongated cocci, often arranged in pairs, and in other cases were less coccoid and more definitely bacillary. In 10 of the cases in which it was found it was the predominating organism, being present in some in enormous numbers. In 3 of the cases no other organisms could be seen in the films, but *B. influenzæ* was abundant.

Cultural examination.—The method employed was to remove a small piece of sputum by means of sterilised forceps from the sterile bottle in which it had been collected. The sputum was then thoroughly washed by shaking in sterile saline, and a piece of the washed sputum was plated out on blood-agar or trypsin-broth-legumin-agar. The latter, on account of its transparency and the relative ease with which *B. influenzæ* grows on it, gave the better results. In this way the influenza bacillus was isolated in 10 of the 18 cases in which an organism resembling it was seen in direct films.

In the investigation of the other organisms present many were diagnosed both from their morphological and cultural characters. But in some of the cases, owing to lack of time, the appearance of the organism as seen in direct films was alone noted. With this proviso it may be stated that in the cases here shown the following organisms other than *B. influenzæ* were found:—

	Cases.		Cases.
Pneumococcus	13	*M. tetragenus*	2
Streptococcus	5	A Gram-positive diplococcus	1
A Gram-negative diplococcus resembling *D. catarrhalis*	5	A large Gram-negative bacillus	1
Staphylococcus	3	*B. tuberculosis*	1

From the following table it will be seen that in most of the cases in which *B. influenzæ* was present in large numbers the pneumococcus also occurred.

Characters of the Bacillus Influenzæ Isolated.

The microscopical appearances are usually those of a minute, slightly elongated coccus with a tendency to grow in pairs end to end. Some longer and more definitely bacillary forms are also, as a rule, present. The organism stains somewhat slowly with ordinary stains and is always definitely Gram-negative.

On "trypagar" growth does not usually appear until 36 hours at least have elapsed. Very small translucent colonies can then be seen which have a convex surface and regular rounded edges. In primary cultures from sputum the influenza bacillus appears to grow more luxuriantly in the vicinity of colonies of other organisms. The colonies are very easily emulsified in water. Attempts at subculture on legumin-agar nearly always failed. On blood-agar growth appears within 24 hours in the form of small transparent colonies. The organism can be repeatedly subcultured on this medium, and though it ultimately tends to die out one strain has at the time of writing been kept going on it for over a month, subcultures being made about once a week. With ordinary agar, glycerine-agar, solidified blood serum, broth and gelatin no growth is obtained. Nor could the organism be cultivated anaerobically on any of the media used.

Table Showing that in Most of the Cases in which B. Influenzæ *was Present in Large Numbers the Pneumococcus also Occurred.*

Serial No.	Name. &c.	Examination of films.	Result of culture.	Other organisms present.	Death or recovery.	Remarks.
1	Pte. C.	+++	+	...	D	Case of bacillary dysentery with septic bronchitis.
2	Pte. H.	+	—	*D. catarrhalis.*	D	Had broncho-pneumonia, right pleural effusion and toxic nephritis.
3	Pte. K.	++	+	None.	D	Had broncho-pneumonia
4	Pte. M.	++	+	*D. catarrhalis.*	D	No pneumonia.
5	Pte. G.	++	—	Streptococcus. Pneumococcus. *D. catarrhalis.*	D	Broncho-pneumonia and toxic nephritis also.
6	Pte. C.	+++	+	Streptococcus. Pneumococcus. *D. catarrhalis.*	D	...
7	Pte. A.	+++	+	Pneumococcus (scanty).	D	Marked emaciation.
8	Pte. U.	+	+	Pneumococcus. *D. catarrhalis.* A Gram-positive diplococcus.	D	Widespread broncho-pneumonia.
9	Pte. G.	++	—	Pneumococcus. Numerous others.	R	...
10	Pte. W.	++	—	Many others.	R	...
11	Pte. W.	++	—	Pneumococcus. Streptococcus.	D	Broncho-pneumonia.
12	L/C. S.	++	—	Pneumococcus.	R	...
13	Pte. D.	—	—	Pneumococcus.	R	...
14	Pte. V.	++	—	*B. tuberculosis.* Staphylococcus. Pneumococcus.	D	Acute tubercular broncho-pneumonia.
15	Pte. H.	+++	+	Staphylococcus. Streptococcus. *M. tetragenus.*	D	Broncho-pneumonia and emphysema.
16	Rev. G.	—	—	Pneumococcus. Streptococcus. *M. tetragenus.*	R	...
17	Pte. T.	—	+	Pneumococcus.	R	...
18	L/C. H.	++	—	Pneumococcus.	D	Double lobar pneumonia.
19	Pte. F.	++	+	Pneumococcus. Large Gram-negative bacillus.	R	Lobar pneumonia.
20	Pte. C.	+++	+	None.	D	No pneumonia. Ante-mortem fall in temp.

Col. 3: +, *B. influenzæ* present in small numbers; ++, in moderate numbers; +++, in large numbers; —, not found.
Col. 4: +, *B. influenzæ* isolated; —, not isolated.

Animal experiments.—Two strains of the organism isolated were injected into mice intraperitoneally and into rabbits intravenously. In another case in which the *B. influenzæ* was present in the sputum in large numbers and was practically the only organism found, a suspension of the sputum in saline was similarly injected into a rabbit and a mouse. In all cases the animals survived and showed no signs of illness.

Vaccine therapy.—A vaccine was prepared from the organism isolated from one of the later cases, but by the time this was ready the epidemic was almost over, and up to the time of writing there has not been a suitable opportunity of using it. It is not, however, likely, if one may judge from the blocked state of the bronchioles, that vaccine therapy will be of any value except in the early stages.

3. MORBID ANATOMY.

The prevalence of bronchitis of a purulent type is seen from a study of 156 consecutive necropsies made during February and early March, 1917, in which it occurs as a primary condition in 45 and as a secondary condition in 26 of the cases examined. Altogether purulent bronchitis was found in 45·5 per cent. of the total cases. In the cases examined bronchitis is more than five times as numerous as lobar pneumonia, which is the other prominent pulmonary disease. Tuberculosis in the form of obsolete foci in lungs or glands was present in 8 of the total 71 cases. In the whole 156 cases tuberculosis was noted in 14. In none of the cases of bronchitis did tuberculosis appear to be active. It occurred in 3 which are regarded as primary, and in 5 secondary cases. It would appear not to bear any definite relation to the incidence of the condition.

Appearances which might be regarded as typical are as follows.

The face is more often than not cyanosed, and often a considerable degree of wasting is present, though in the more rapidly fatal cases this is not so apparent.

The lungs show three prominent features. They are almost always bulky on account of a great amount of emphysema which affects chiefly their anterior margins. The heart is often greatly obscured by bulky lung when the chest is opened.

Some degree of pleurisy is generally present; more often this is plastic in type, though occasionally small collections of fluid are found in the pleural cavities; clear yellow fluid was found in 8 of the cases examined, 5 of these being primary. In only 2 cases did the effusion exceed a few ounces; both of these were cases of primary bronchitis. Empyemata are not often found.

The third feature is the constant appearance of a thick yellowish pus in the bronchi. In the larger bronchi it is mixed with air, and often is discoloured by altered blood; but in the small tubes cut in section the pus exudes spontaneously as a rule, with little or no admixture of air. A lung cut in the ordinary way may show large numbers of small yellow points from which pus is exuding.

Considerable œdema is commonly associated with the above appearances, and a greater or less degree of collapse, generally at the vertebral borders of the lower lobes, was found in 15 of the cases examined.

A certain number of cases pass on to a condition of broncho-pneumonia, and when this occurs it usually shows itself in the form of small solid nodules, in the centre of which are pus-containing bronchioles. Consolidation has been first observed near to the roots of the lungs, and in a few has been so extensive as to simulate lobar pneumonia at the necropsy. Broncho-pneumonia was recorded in 32 of the 71 cases examined, of which 22 occurred in cases primary from the start.

In 34 of the cases of primary bronchitis lymphatic glands in the root of the lung, the bronchial group, and the tracheal glands were noted as greatly enlarged, and on section they were grey or pinkish-grey in colour. Not uncommonly the mesenteric and retroperitoneal and even inguinal and axillary glands were found affected.

The spleen in many cases was found engorged and not soft. On cutting the organ the corpuscles were often found to stand out prominently as if sharing in the disorder of the lymphatic glands.

Some degree of derangement of the kidneys was noted in 25 out of the 45 primary cases, taking the form of some swelling and pallor of the cortex. Often the kidneys had lost their firm consistence and were flabby and in a few cases soft. Engorgement, on the other hand, was noted in a few, generally accompanied by engorgement of the spleen. The liver very often showed evidence of fatty change.

The right side of the heart was almost always dilated and the myocardium commonly pale and friable. No evidence of endocarditis was found in any case. A few ounces of pericardial fluid, always pale yellow and clear, were found in 10 cases, but this was not associated with any roughening of the pericardium or cohesion of its surfaces. Broadly speaking, these findings fall into two groups. In one the organs are congested, the heart dilated, though fairly healthy, and the patient cyanosed; in the other the organs are flabby or soft, the heart muscle pale and friable, and the patient pallid. The first group corresponds with a suffocative and the second with a toxic death.

Histology.

An examination of portions of lung, bronchial gland, and kidney taken from eight of the fatal cases was made. The following is a summary of the histology of these organs.

Lungs.—The most striking changes are in the smaller bronchi. Their walls are thickened and the vessels engorged; the lining epithelium, which is at first intact, is later detached in parts from its basement membrane, and the epithelial cells can be seen lying free in the lumen. In a still more advanced stage the bronchiole is entirely denuded of mucous membrane, and its wall consists of granulation tissue which greatly diminishes its calibre. The bronchi are in the less advanced stages almost completely filled with pus, in which, in some cases, the influenza bacillus was found in appropriately stained sections. Later on columnar epithelial cells in small masses are mixed with the polymorphonuclear pus cells, and by the time the epithelium is entirely shed the amount of pus in the bronchus is greatly diminished. Many of the specimens show marked broncho-pneumonia, but in some there is no great extension of the inflammatory process to the surrounding lung tissue. Indeed, the small extent to which catarrhal pneumonia is often present in the vicinity of markedly involved bronchi would suggest that the pneumonia is due to a local toxic effect rather than to an infection of the corresponding area of lung tissue.

Bronchial glands.—There is extreme congestion and enlargement of lymph nodes. In one specimen one of the larger arteries was thrombosed, but no suppurative change was present in any of the cases.

Kidneys.—In almost all there is degenerative change in the tubular epithelium due to toxic action. This varies in degree, and in the most marked cases there is desquamation of epithelium, round-cell infiltration, and congestion, the condition being indistinguishable from an acute tubular nephritis.

CONCLUSIONS.

1. We are here dealing with an epidemic of a variety of purulent bronchitis.

2. For the following reasons we consider the cause of the disease to be the influenza bacillus: (*a*) The almost constant occurrence of this organism in the sputum; (*b*) its presence in the pus of the affected bronchioles; (*c*) in some typical cases it occurs apart from the presence of any other organism; (*d*) the outbreak of the disease in epidemic form at the time of year when influenza epidemics are most common and whilst one was actually in progress; (*e*) the marked signs of toxic poisoning which are found during life and post mortem.

3. There are well-marked clinical features which distinguish these cases from ordinary cases of bronchitis. The most prominent are the characteristic sputum, the extreme tachycardia, the cyanosis, the course of the temperature (notably the ante-mortem fall), and the extremely high mortality.

4. Treatment has so far been unsatisfactory. The most encouraging results have been obtained by use of a steam tent. Vaccines have not yet had a trial, but it is unlikely, in view of the blocked condition of the bronchioles, that they would be of great benefit.

5. The morbid anatomy consists of three groups of changes. (*a*) The lung condition: Marked purulent bronchitis, the smaller bronchi being filled with thick pus, from which air is notably absent. In some cases secondary broncho-pneumonia and œdema, pleurisy, and emphysema are common. (*b*) Evidence of toxæmia: Especially seen in kidneys, spleen, liver, lymphatic glands, and heart muscle. (*c*) Signs of right side heart failure and passive congestion. Some cases die of the toxæmia and others of the cardiac failure.

6. The histological changes are those of an acute purulent bronchitis affecting the smaller bronchi with or without some surrounding catarrhal pneumonia. Degenerative changes are seen in other organs, notably in the kidneys, where the appearances of a toxic nephritis may be found.

We are indebted to Colonel Sir John Rose Bradford, K.C.M.G., who originally pointed out to us the distinctive nature of these cases and who has given us much kind assistance throughout the investigation. Our thanks are also due to Professor J. H. Teacher, of Glasgow, for his kindness in preparing the photo-micrographs.

DESCRIPTIONS OF FIGS. 1 TO 6.

FIG. 1 (Case 7).—Marked congestion of bronchial wall with polymorph infiltration. Mucous membrane well preserved except at one part. Lumen almost completely filled with pus. No peri-bronchial pneumonia. (Same size as original.)

FIG. 2 (Case 7).—Part of the wall of a large bronchus showing congestion of submucosa, emigration of leucocytes through the swollen mucous membrane, and the purulent collection in the bronchial lumen. (× 120.

FIG. 3 (Case 4).—A moderately large bronchus with muscular and cartilaginous wall. There is free desquamation of epithelium which is seen lying among the pus in the lumen. The adjacent lung tissue (of which very little is here shown) is markedly congested, but not consolidated. (× 60.)

FIG. 4 (Case 6).—A bronchiole almost full of pus. Only here and there can the remains of mucous membrane be detected. There is a pneumonic condition in the surroundiug air vesicles, large pigmented catarrhal cells being present. (× 60.)

FIG. 5 (Case 6).—A high-power view of part of the preceding specimen. It shows the purulent bronchial contents, the remains of mucous membrane, and the surrounding catarrhal pneumonia. (× 120.)

FIG. 6 (Case 3).—A small bronchus showing a later stage than the other photographs. Epithelium completely shed and the mucn-thickened mass consisting entirely of young granulation tissue. Surrounding lung tissue congested, but no pneumonia present. (× 60.)

FIG. 3 (Case 3).

FIG. 4 (Case 4).

Descriptions of Cases.

CASE 1.—A. J. M., age 39. Unaccustomed to marching; began hard marches. Feet became very sore, specially after resting. Six weeks ago after a hard march the right foot swelled and was more painful than the left. He was not aware of a sudden acute pain like that caused by a bone breaking. The right foot continued painful for a month, but he carried on, going into the trenches and out again. After four weeks he had to give up. At the end of the sixth week he was X-rayed in our hospital, and there was shown to be fracture of the second right metatarsal bone near the head, surrounded by very abundant callus. (Fig. 1.)

CASE 2.—A. S., age 19. Marched for ten days with full pack, doing about 10 kilometres a day. While marching on the tenth day his feet were very sore and he felt a sudden acute pain. He carried on for nearly three weeks, at the end of which he was sent to our hospital, where an X ray was made, showing fracture of the second and third right metatarsals near the head, with abundant callus. (Fig. 2.)

MARCHING FRACTURES.

BY A. HOWARD PIRIE, B.SC., M.D. EDIN.,
CAPTAIN, C.A.M.C.

BY a "marching fracture" is meant fracture of a second third, or fourth metatarsal bone, or combination of these, in the right or left foot, caused by marching, and with no history of an accident.

This fracture comes under the class of fracture caused by muscular action combined with indirect violence, and is caused by severe prolonged marching.

My attention was called to it by two men coming the same day with the same kind of fracture of a metatarsal bone, and neither of them would admit an accident. The typical history is that after a long march, such as 29 kilometres in one day in full marching order or after 10 kilometres a day for ten days, the patient's feet become very sore, especially when standing up after resting. This indicates that the arch of the foot is giving way. The breaking of a metatarsal bone then takes place while marching. This seems to be Nature's method of making the man lie up, so that the arch of the foot may recover itself. The patient does not know when the fracture takes place, as his feet are already so sore from the acute flat-foot. After the fracture takes place he struggles on for a time, but has finally to fall out. He remains with his unit because most of the other men have sore feet too, and there is a stigma attached to a man who falls out because his feet are sore. A time comes—it has been usually about three weeks in our experience—when he has to give up and is sent to hospital.

The X ray photograph made three weeks after the fracture takes place shows a fractured metatarsal bone with abundant callus. One seldom sees so much callus formed in three weeks as occurs in these fractures. No doubt this is due to movement during walking with the fracture.

The exact cause of a marching fracture seems to be the following. In the normal foot the arch of the foot is so constructed that the bulk of the weight of the body is transmitted through the stout first metatarsal. The next strongest bone is the fifth metatarsal, which takes the next largest share in bearing the weight of the body. By referring to the skeleton one sees that the second metatarsal is the weakest bone, the third and fourth following it in order of strength.

When the arch falls down the weight of the body is distributed more equally to all the metatarsals, but the central ones being in more direct line with the astragalus get more than their share of the weight, and the second metatarsal being in direct line with the head of the astralagus gets the greatest proportion of the weight of the body. It receives more weight than it is constructed for, and under prolonged strain of long marching, when the soldier is carrying his full equipment, it gives way.

When a person stands on his toes on one foot, the greatest breaking strain is near the head of the metatarsal bones, and this is the position in which the fracture occurs most frequently. It probably occurs when the man rises on to the toes of one foot to make a forward step with the other foot.

In four of our cases the fracture occurred near the head and in two near the middle of the shaft.

This fracture must be fairly common during the long marches made by our men, as these six cases have come to my notice in a series of 13,000 X ray negatives.

FIG. 5 (Case 5).

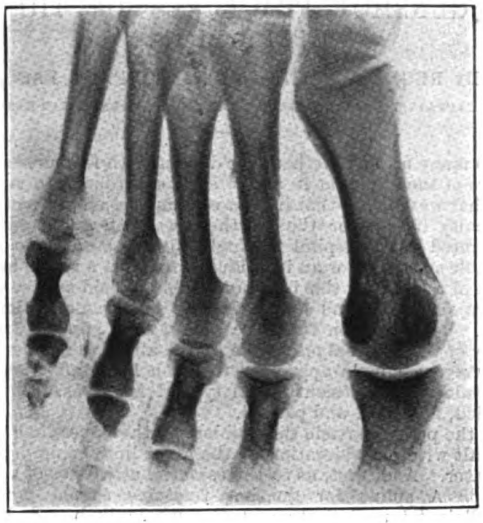

FIG. 6 (Case 6).

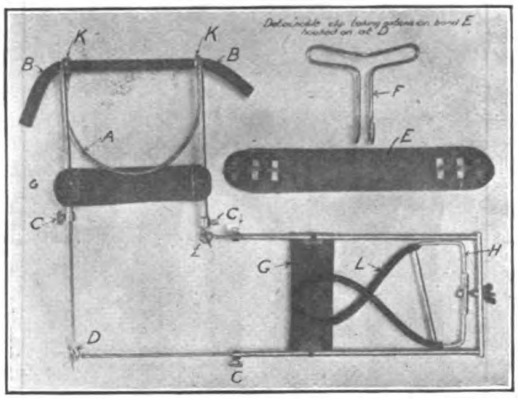
Descriptions of Cases (continued).

CASE 3.—H. T., age 29. After a march of 29 kilometres in one day his feet were very sore. Next morning his feet felt "as if they were going to burst." That day he marched 9 kilometres, and had to fall out from the pain in his feet. No history obtainable of any sudden breaking pain. He was flat-footed before joining the Army. About three weeks after the day he had to give up after marching 9 kilometres he came to our X ray department, and the X rays showed fracture of the third right metatarsal about its middle, with abundant callus formation. (Fig. 3.)

CASE 4.—C. O., age 30. While on a long march pain of acute kind came on in his left foot, and he had to fall out. He had no accident to cause the pain. He carried on for about three weeks, and the X ray photograph made five weeks after the time when the acute pain came on shows fracture of the second left metatarsal near its head. (Fig. 4.)

CASE 5.—T. N., age 34. During a long march, with full equipment, he felt severe pain in his left foot. No history of accident to it. He carried on with his unit for two weeks, and then had to give up. Three weeks after the severe pain the X ray photograph showed fracture of the third left metatarsal about its middle. (Fig. 5.)

CASE 6.—Pte. B., age 19½. Felt severe pain in foot during a long march. Came for X-rays three weeks later. X rays showed fracture of fourth right metatarsal near the head, with abundant callus. (Fig. 6.)



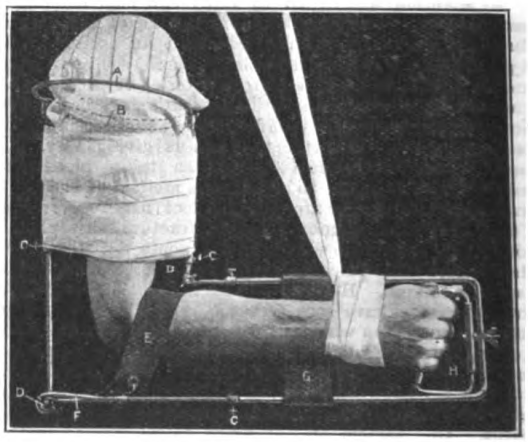
A UNIVERSAL EXTENSION-SPLINT FOR GUNSHOT FRACTURES OF THE UPPER LIMB.

BY REGINALD WILLIAMS, L.R.C.P. & S. EDIN.,
LATE CAPTAIN, R.A.M.C.; SURGICAL SPECIALIST, BARNET WAR HOSPITAL.

So many are the methods for dealing with fractures of the bones of the arm that it might seem superfluous to suggest another were it not that in that very multiplicity of method a difficulty lies. For though the specialist, particularly if appointed to a hospital in England, may be able to make suitable selection for an individual case from a varied assortment of apparatus, this is impracticable in field-service work, where simplicity and unification are of paramount importance. The question therefore arises, is it possible from a study of the cardinal principles of the already existing types to evolve a simple apparatus for each limb, affording not only adequate treatment for all typical fractures, but easily applied, adjusted, and packed.

In the present article the problem of the upper limb alone is dealt with, consideration of the lower limb being deferred till later. And, first, as to the essential attributes of such a splint. A splint for gunshot fractures should provide: 1. Efficient immobilisation of the whole limb. 2. Ready access to wounds without disturbance of immobilisation. 3. Adequate extension of the broken segments. 4. Maintenance of joints in a position of physiological rest or of maximum functional utility in view of possible subsequent stiffness and adhesions. 5. Distribution of pressure over as wide an area as possible to prevent pressure sores. 6. Lightness and adaptability for application to limb and also for transport. 7. A composition, such as rubber and galvanised metal, which can be easily cleaned and sterilised.

FIG. 1.

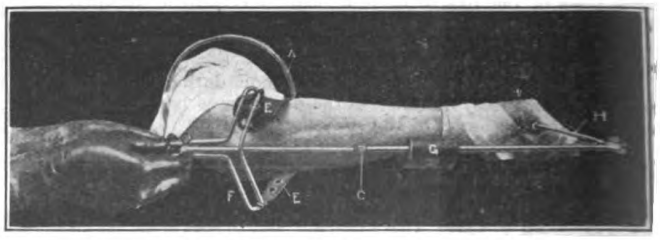


Description of Splint.

It is probably generally acknowledged that the only system which adequately combines immobilisation with access for dressings is some form of metal frame following the outline of the limb and affording support to the latter by means of slings.

Fig. 1 shows a splint of galvanised wire after the pattern of the cradle splint of Major E. Hey Groves, but differing essentially therefrom in that the wire framework does not pass under the axilla. The shoulder-piece (A) is hinged to the tubular framework in such a manner as to allow of its being swung into any position. It can thus be used for either arm and packed flat for transport. Through the hinges connecting the shoulder-piece to the frame a rubber tubular band passes under the axilla, firmly gripped by the said loops, but not too firmly to prevent adjustment. To the forward end of the splint is affixed an angled loop of wire (H) secured by a bolt which passes through the frame and forms a pivot about which the loop can turn, the bolt being provided with a winged nut by which it can be tightened at will and set at any desired angle of supination. In whatever way the wrist is fixed, as the hand-piece swivels on a transverse bar movements of flexion of the wrist are not prevented, nor are movements of the fingers interfered with. A flat elastic band (L) is passed under the wrist and crossed over the back of the hand, the hooked end being attached to the angled loop of wire (H). Accessory rubber slings (G G) are hooked on to the frame when necessary. The detachable T-shaped metal loop (F) is hooked on to the winged nut (D) at the lower angle, and the broad elastic band (E) is affixed below the elbow for fracture of the humerus (see Fig. 2) and behind the elbow for fractures of the lower arm, as shown in Fig. 4.

FIG. 2.



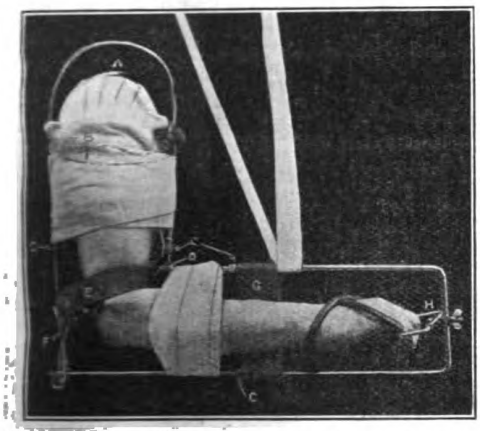
Universal splint applied to a case of fractured humerus.

Method of Application.

Fracture of humerus (Fig. 2).—One end of the axillary tube (B) having been withdrawn, the angled splint is laid over the fractured limb. Accessory rubber slings (G G) are placed in position; the tubular axillary band is replaced in the head-piece and drawn taut, thus fixing the splint at the shoulder. The wrist is next fixed to the hand-piece (H). The broad elastic band (E) is then passed over the forearm and fastened with the necessary degree of tension to the T-shaped metal loop (F). (See Fig. 3.) By this arrangement constriction of the soft parts and interference with the venous return are avoided. Traction being now applied, the fractured segments of bone are drawn asunder, the rubber tube in the axilla pulling upwards and the elastic band downwards.

As to final slinging and adjustment, the three cardinal points of the arm—viz., the shoulder, elbow, and wrist—having been immobilised, dressings are attached to the limb by bandages which encircle the arm and corresponding part of the splint, the removal of which in no way disturbs the adjustment of the fracture. When the patient is up a narrow sling passes round the wrist portion of the splir and supports it to the neck. The limb can be lifted int any position desirable for dressing and irrigation purpose as also for the prevention of fixation at the shoulder-join (See Figs. 2 and 3.)

FIG. 3.



Fractured humerus put up as in Fig. 1, the limb being raised and abducted for dressing purposes.

Fracture of forearm.—The shoulder having been fixed, th rubber band (L) is attached to the hand-piece (H), which

fixed in any position desired by means of the T nut controlling the hand-piece. The rubber band (E) is passed above the elbow and attached to the T-shaped metal loop (F), now fixed in position behind the elbow. The T screws (C C) are loosened and the forward end of the splint is drawn out till sufficient tension on the broken segments is obtained. The screws are then fixed in this position. Fig. 4.)

FIG. 4.

Universal splint applied to a case of fractured forearm. The forearm is completely pronated.

Fracture in elbow region.—In Fig. 5 the T screws (C C C C) and the winged nuts (D D) (Fig. 1) have been loosened and the forearm portion of the splint has been straightened and fixed in position. The T-shaped attachable loop (F) has been removed and the rubber band (E) has been used as an accessory sling.

FIG. 5.

Universal splint applied to a case of fracture of the neighbourhood in the elbow-joint.

Advantages of the Splint.

The advantages of this splint are the following:—

1. Only one splint is required for any typical fracture of the upper limb.
2. A gradual, painless, and sufficient extension is effected.
3. It is the ideal splint for field dressing stations. Once affixed, it need never be removed, as the rubber bands can be detached and sterilised daily.
4. The weight of the splint, with attachments, is only 1¾ lb.
5. It can be packed flat or in sections. By the latter method it can be sent by post in a cardboard box 12 × 9 × 1 in.
6. The entire splint can be sterilised and can at any time be placed in an arm-bath.
7. The comfort of the patient is enormously increased and pain is practically eliminated.
8. The nurse's work is reduced to a minimum.

This splint is a combination of three splints designed and used by the writer at the Barnet War Hospital, and the results there obtained emboldened him to seek a wider field. They have been tried and approved by the following surgeons, whose encouragement the writer would here wish to acknowledge: Colonel A. Carless, Eastern Command; Major E. Hey Groves, Beaufort War Hospital; Surgeon-General N. R. Howse, C.B., V.C., Australian Forces; Captain E. C. Hughes and Sir W. Arbuthnot Lane, Bart., Millbank; Mr. D. Ligat, Middlesex Hospital; Mr. V. Warren Low, St. Mary's Hospital; Colonel T. H. Openshaw, C.M.G., London Hospital. Special indebtedness is due to Major Hey Groves for the inspiration of the work and assistance in preparing this article; to Lieutenant H. T. Booker, R.E., for the drawings; and to Lieutenant W. Daunt, R.A.M.C., High Barnet War Hospital, for experimenting with the earlier models.

ON THE TREATMENT OF

RECENT GUNSHOT WOUNDS WITH BISMUTH-IODOFORM-PARAFFIN PASTE.

WITH SPECIAL REFERENCE TO COMPOUND FRACTURES.

BY L. COLLEDGE, M.B. CANTAB., F.R.C.S. ENG., CAPTAIN, R.A.M.C. (T.F.);

AND

HAMILTON DRUMMOND, M.B. DURH., F.R.C.S. EDIN., CAPTAIN, R.A.M.C. (T.F.)

A LARGE number of cases have now been reported in which the bismuth-iodoform-paraffin paste (B.I.P.P.), introduced by Professor Rutherford Morison, has been employed with satisfactory results. These cases, however, have all been sent to England suppurating freely before this treatment was applied, and its use in recent wounds has not been reported. The writers wish to record their experience of the use of B.I.P.P. in recent wounds as encountered in a casualty clearing station and to advocate this method as a treatment for recently infected wounds in which suppuration is not yet fully established. They have been further encouraged by the report of Dr. Louisa Garrett Anderson and Dr. Helen Chambers on a large series of cases treated in England, for they say "the best results are obtained when B.I.P.P. treatment is applied soon after the man has been wounded." The danger of gas gangrene has deterred surgeons from employing the method at this early stage in wounds which are constantly infected with the various strains of organisms which produce gas gangrene. Fleming found in the bacteriological examination of 127 cases of wounds from one to seven days old *B. aerogenes capsulatus* (*B. perfringens*) in 103 cases, streptococci in 102 cases, staphylococci in 40 cases, *B. tetani* in 22 cases. He found also a variety of other organisms in 67 cases. In a series of 25 specimens, including missiles, fragments of clothing, pieces of excised skin and portions of resected muscle from wounds seen in this casualty clearing station within 24 hours of the receipt of the injury, the following organisms were found by Captain J. W. McNee and Captain J. S. Dunn in films and cultures: in 23 cases large bacilli of perfringens type; in 9 cases streptococci; in 1 case *Staphylococcus aureus*; in 1 case Gram-negative bacilli. In only one instance in which some fragments of cloth from a wound were examined by films and cultures was the result negative.

Advantages of Method and Technique.

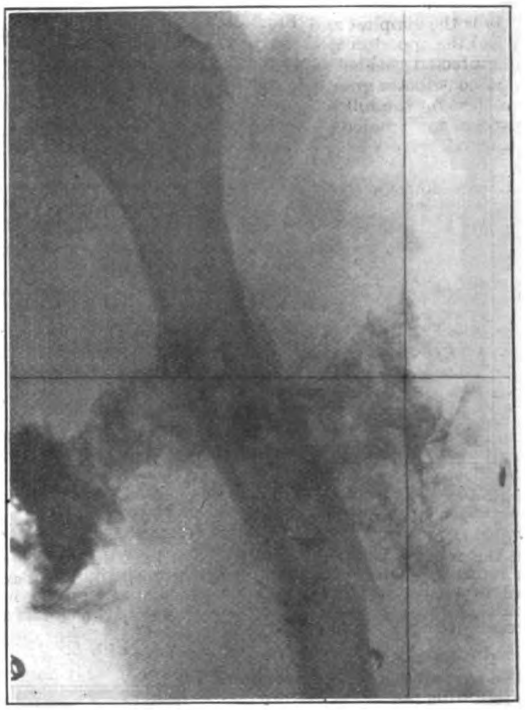
The method rightly used has the following advantages:—

1. The wound can be closed by sutures, rendering prolonged drainage unnecessary, and in the great majority of cases there is no suppuration.
2. No change of dressings is required and much disturbance of the patient is avoided—a most important matter to freshly wounded men to whom rest is essential.
3. It greatly increases the facility and reduces the discomfort of transport. Apart from wounds of the viscera and central nervous system, the management of compound fractures presents the most difficult problem for the surgeon in a casualty clearing station, and it is in this class of cases that the writers have found the method particularly valuable.
4. There is no increased liability to the development of gas gangrene. On the contrary, it is diminished.

Technique.—The patients usually arrive in a filthy condition, encrusted with mud. The skin around the wounds, for now they are usually multiple shell, bomb, or grenade wounds, is cleaned with ether soap and rendered as surgically clean as possible. The part is surrounded with dry sterilised towels. Surrounding the entry and exit wounds there is always a margin of necrotic skin heavily infected with micro-organisms. This is removed by excising a ring of skin one-eighth of an inch wide. The wound is then freely opened up and all foreign bodies and loose pieces of bone are as far as possible removed. Further, all devitalised muscle is resected and bleeding points are secured with Spencer-Wells artery forceps. This resection extends not only to muscle which is obviously necrotic, but also to areas which are devascularised and non-contractile. It is in muscle in this condition that gas gangrene begins to spread. Although this procedure is most important, the writers have had long enough experience to know that in itself it is insufficient to prevent the subsequent development of obvious signs of infection in compound fractures. The raw surface

is then well swabbed with methylated spirit, and the B.I.P.P., consisting of 2 parts of iodoform to 1 of bismuth subnitrate with sufficient liquid paraffin to produce the consistency of Devonshire cream, is smeared all over the wound and the ends of bone with a piece of dry gauze. It should be well rubbed in to form a thin film on the surface, and care should be taken not to leave any excess. It is convenient to leave the ligaturing of bleeding points until this stage, as otherwise the ligatures are apt to be rubbed off. Gaps in muscle can be brought together with catgut stitches when necessary. The wound is then sewn up with interrupted fishing-gut sutures and a dressing of dry sterilised gauze is applied; this is covered with wool, and, if required, a splint is applied. In a favourable case the dressing need not be disturbed until the patient is evacuated to the base, as it is an invariable rule to examine the wound before the patient leaves. If the outer dressing becomes stained with discharge it should be changed without disturbing the gauze in contact with the wound. If the patient has to be evacuated immediately to the base it is advisable to insert the fishing-gut stitches, but to leave them untied or only loosely tied. They can then be tightened later on without fear of tension being caused in the wound by retained discharge. This applies particularly to very extensive wounds.

It will be observed that the writers have differed from the technique described by Professor Rutherford Morison in the free excision of damaged tissues, the reason being the liability to the development of gas gangrene in recent wounds containing devitalised muscle. Such muscle is highly dangerous and permanently functionless; consequently, no further damage is done by resecting it. Moreover, the belly of the individual muscle is frequently torn across, so that the muscle as an organ is rendered useless, unless it be sutured with catgut, which this technique renders possible.



Results of Treatment.

As a rule there is a general reaction following this procedure lasting from 24 to 48 hours. This is shown by an elevation of the temperature and pulse-rate. This soon subsides and there are no other alarming symptoms, so that the surgeon must not be deterred and tempted to examine the wound. Should, however, the wound be examined, it will be found in a favourable case that the edges present the signs of a mild inflammatory reaction, the evidences of which have disappeared by the third or fourth day. There is a discharge consisting of serum mixed with the products of decomposing B.I.P.P. It is not foul, but smells strongly of iodoform. The amount is roughly proportional to the area of the raw surface involved. Should the case not be progressing well, the general appearance of the patient is most suggestive, and there is pain and tenderness in the part affected, and when examined it is red and swollen. The temperature and pulse-rate remain high. This has only happened in two cases, one a shell wound of the thigh, the other a grenade wound of the wrist, neither of them being compound fractures. The symptoms and signs were unmistakable the day following the operation in each case; both cases recovered after opening up and draining the wounds freely. The failure was probably to be attributed to insufficient resection of damaged tissues. So far there have been no cases presenting signs of iodoform or bismuth poisoning, but care has been taken not to use an excessive quantity of B.I.P.P. nor to leave any lumps in the wounds.

The writers have used this method since September, 1916, but not continuously. A large number of compound fractures have come under their observation since that date which have been treated by various methods; but as they have found this method gives the most satisfactory results, they now use it exclusively in all compound fractures. They have found it valuable also where amputation has to be performed on account of severe laceration of the tissues; in such cases the stump almost invariably suppurates otherwise.

Illustrative cases.—The following short notes of five typical cases illustrate its use in compound fractures:—

CASE 1. *Compound fracture of left femur.*—Lance-Corporal W., wounded by a shell fragment at 10 P.M. on Feb. 17th, 1917. The entry wound was over the anterior aspect of the thigh at the level of the junction of the middle with the lower third, size of a two-shilling piece. The exit wound at the same level was 4 inches in length, situated at the back of the limb. Operation 12 hours later. The wound was freely opened up in front and non-contractile muscle and many fragments of loose bone were removed. The same was carried out through the posterior exit wound. The biceps muscle which had been completely divided across showed much laceration. The wound was well dried out with methylated spirit and B.I.P.P. applied. The muscles were brought into apposition with catgut sutures and the skin with silkworm gut. The patient made a straightforward recovery and went to the base on the seventeenth day after operation. The temperature on one occasion (fourth day) reached 102° F., after which time it came down to normal. The anterior wound was healed, and posteriorly, except for a sinus leading down to a bare area of bone, the wound was healing well. Bacteriological examination showed exudate from this wound containing streptococci and staphylococci.

Radiogram of Case 5, showing the appearance of the fracture after being treated with B.I.P.P.

CASE 2. *Machine gun bullet wound of right radius.*—Corporal B. was admitted to hospital at 2 A.M. on Feb. 28th with a wound of the right arm. The missile had entered just below the head of the radius and passed out at a point on the same level over the inner aspect of the limb. The forearm was very swollen and tender, and there was no pulse at the wrist. Operation 11 hours after injury. On laying open the wound the radial artery was found divided close to its origin; both ends of the vessel were ligatured and several fragments of bone which were completely detached were removed. The radius showed much comminution just below the head of the bone. Wound dried out with methylated spirit, gauze and the B.I.P.P. applied The wounds were entirely closed without a drain. The patient left on the seventh day after the operation when he was dressed for the first time. Both wounds were healed by first intention. He was transferred to England on the fifteenth day after the operation quite healed and with the sutures removed.

CASE 3. *Rifle grenade wound of right radius.*—Private M., admitted to hospital on March 8th at 6 P.M. He had been wounded six hours previously. There was an entry wound in the outer aspect of the right forearm the size of a sixpence. The exit wound, which was larger and showed more destruction of the skin, was on the same level and on the inner aspect of the limb. Operation eight hours after injury. Both wounds were freely laid open and several fragments of bone were removed; the shaft of the radius, however, was not completely broken across After following the usual technique the wound was completely closed in layers. The usual general reaction followed and patient left with a normal temperature and pulse on the fifth day. The entry wound was healed by first intention and the exit wound showed a small amount of blood-stained serum from one point, otherwise it was healed.

CASE 4. *Compound fracture of femur.*—Private, admitted on March 3rd suffering from a scalp wound and a compound fracture in the lower third of the right femur, due to shell wounds. Operation 12 hours after injury. The scalp wound was excised and sutured; this healed by first intention and the stitches were removed on the sixth day. The thigh wound was freely opened up and all foreign bodies were removed. Skin and torn muscle were excised. The raw surface was treated with B.I.P.P. and the wound sewn up. A Wallace splint with plaster extension was applied. The patient was evacuated to the base on March 12th, the wound being quite healthy, and Colonel Cuthbert Wallace, A.M.S., informed us on April 1st that he had recently seen the patient in a satisfactory condition in a base hospital.

CASE 5. *Compound fracture of humerus.*—Private, admitted March 22nd suffering from shrapnel wound causing compound fracture of surgical neck of left humerus. Operation 12 hours after the receipt of injury. A shrapnel ball was removed from the axilla by new incision. This was treated with B.I.P.P. and sutured. The wound of entry was excised and all dead tissue was cut away. The raw surface and bone ends were treated with spirit and B.I.P.P. in the usual way and the wound sewn up. Patient was sent to the base on March 26th. There was then no sign of any suppuration in the wound when it was redressed with gauze and spirit.

Conclusions.

1. The method is applicable to recent as well as to wounds several days old.

2. There is no increased liability to gas gangrene if care be taken to eliminate that danger by free incision of damaged tissue.

3. It is the simplest and most reliable method the writers have had the opportunity of employing of avoiding suppuration in infected gunshot wounds.

4. It contributes greatly to the comfort and well-being of the patient for the following reasons: (*a*) wet dressings and irrigations are avoided; (*b*) as the dressings need seldom be changed there is a minimum disturbance of the injured part.

THE HÆMOGLOBIN VALUE OF THE BLOOD IN SURGICAL SHOCK.

BY F. A. BAINBRIDGE, M.D. CANTAB., F.R.C.P. LOND., D.SC. LOND.,
PROFESSOR OF PHYSIOLOGY IN THE UNIVERSITY OF LONDON;
AND
H. B. BULLEN, B.A. CANTAB.

IN a Memorandum recently issued by the Medical Research Committee (published in THE LANCET of March 31st) evidence is brought forward that shock, experimentally produced in animals, is usually accompanied by a considerable loss of plasma from the blood into the tissues. The loss of plasma not only diminishes the volume of the circulating blood but also renders it more concentrated, and the increased concentration is manifested by a rise in the *percentage* hæmoglobin value of the blood. The Memorandum also contains a reference to observations made in France by Captain Marshall, R.A.M.C., which support the view that loss of plasma into the tissues is an important factor in surgical shock *in man*.

Surgical shock in man, however, is frequently associated with considerable hæmorrhage; and, as is well known, the normal reaction of the body to hæmorrhage is the rapid absorption of fluid from the tissues into the blood. By this means the volume of the blood is more or less completely restored to its former level, although the blood becomes more dilute and its percentage hæmoglobin value is lowered. It seems probable that in a patient suffering from both shock and hæmorrhage the percentage hæmoglobin value of the blood represents the outcome of two opposing processes—namely, shock which tends to concentrate the blood and hæmorrhage which leads to dilution of the blood. Determination of the percentage hæmoglobin value in such a case ought to show which of these processes is predominant; a low hæmoglobin value may be regarded as indicating that the patient is spontaneously increasing the volume of his blood at the expense of his tissue fluids, whereas if the hæmoglobin value is approximately normal the physiological reaction to loss of blood is being counteracted by the tendency of shock to concentrate the blood.

We have recently had the opportunity of determining the hæmoglobin value of the blood in several cases of shock. The patients were injured almost simultaneously, and were admitted a few minutes later to St. Bartholomew's Hospital. Three hours later, when the hæmoglobin value of their blood was determined, four of the patients had lost a considerable amount of blood, and in three cases the hæmorrhage was not completely checked; all the patients showed well-marked clinical signs of shock. The nature of the injuries and the observations made on the blood are summarised in the table.

The hæmoglobin determinations in Cases 1–4 make it clear that the patients who recovered reacted to hæmorrhage by absorbing fluid from their tissues into the blood, and thereby restored the volume of the circulating blood. On the contrary, this compensatory process failed to take place in the patients who died from shock. Further, in Case 5, who had no hæmorrhage, the hæmoglobin value rose considerably above the normal figure. These cases are too few in number to justify any dogmatic statement as to the prognostic significance of the hæmoglobin value of the blood in surgical shock. It seems legitimate, however, to point out, first, that they entirely support the view that loss of plasma from the blood into the tissues is an important factor in shock; and, secondly, that they have a direct practical bearing.

The obvious inference from these observations is that, in shock accompanied by hæmorrhage, a normal or approximately normal hæmoglobin value indicates that the patient is unable to make up for the loss of blood by absorbing fluid from his tissues. In these circumstances the volume of his blood becomes inadequate for the carrying on of the circulation, and the intravenous injection of saline solution (preferably a hypertonic solution) is desirable at the earliest possible moment.

No. of case.	Man or boy.	Age.	Nature of injury, &c.	Hæmoglobin examination on same day.*		Result.
				3 P.M.	6 P.M.	
1	M	30	Compound fracture of tibia and fibula of both legs. Wound of right knee, involving the joint. Considerable loss of blood. Right leg amputated at seat of election 2.30 P.M. Hb sample taken immediately after the operation.	67	—	Recovered.
2	M	—	Both feet shattered; severe hæmorrhage. Both feet amputated approx. 4 P.M.	87	95	Died from shock 40 hours after injury.
3	M	—	Compound fracture of right ankle and considerable hæmorrhage. Superficial burns of arm and trunk. Amputation at seat of election at approx. 5 P.M.	92	—	Died from shock within 12 hours after injury.
4	B	17	Compound fracture of left tibia and fibula. Fracture of base of skull. Moderate hæmorrhage. No major operation performed.	62	—	Recovered.
5	M	—	Very severe deep burn of right leg and side; tissues charred to a depth of 1 in. Popliteal nerve exposed and partly burnt. No hæmorrhage.	108	94	Recovered.

* In each case the injuries were received at 11.40–11.50 A.M.

At the time of the first hæmoglobin estimation none of these patients, except Case 1, had received saline injections; Case 1 had 1 pint saline per rectum between 2.30 P.M. and 3 P.M. Between 3 P.M. and 6 P.M. Case 5 drank several pints of fluid.

A DEVICE FOR INSURING SPONTANEOUS SEPARATION OF BLOOD CLOT FROM THE WALLS OF THE CONTAINING VESSEL.

BY A. D. GARDNER, M.D. OXON., F.R.C.S. ENG.

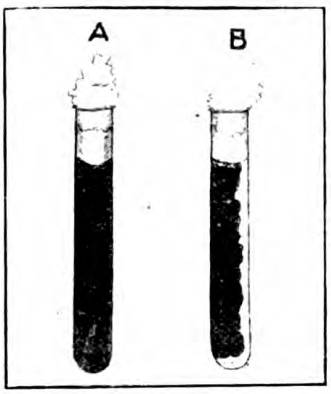
(*From the Department of Pathology, University of Oxford Standards Laboratory under the Medical Research Committee.*)

ONE of the chief difficulties that I, doubtless in common with many other workers, have experienced in the obtaining of serum from blood is the frequent refusal of clot to separate from the walls of the containing tube or cylinder. Many pathologists, it seems, have never been troubled by this difficulty; others, however, have. For instance, Lord Lister, as quoted by Sir W. Watson Cheyne,[1] observed that if blood be drawn aseptically into a glass vessel sterilised by heat the clot which forms does not contract and squeeze out serum. But, on the other hand, in reply to this quotation, Wright states that[2] "the whole of the serum industry depends on the fact that blood when drawn into a vessel which has been sterilised by heat *does* contract and squeeze out serum."

Thus we have apparently a disagreement between two very eminent observers upon one of the commonest laboratory phenomena. Lister's unqualified statement would meet with little support from workers who have had any consider-

[1] British Journal of Surgery, 1916.
[2] THE LANCET, Sept. 16th, 1916, p. 507.

able experience of serology, for blood clot is at least quite frequently found to separate and contract properly in glass vessels sterilised by heat. On the other hand, Wright's statement, which suggests that there are few or no exceptions to the rule that such clot does separate and contract, is not in agreement with my own experience. Dudgeon, Corbett, and Bawtree,[3] in describing the preparation of human serum, say that separation of clot and expression of serum take place in a few hours in sterile glass vessels. They mention no exception to this rule. I may observe in this connexion that my own experience of serological work at St. Thomas's Hospital was in full agreement with their observation, for I can hardly remember a single case of failure of separation while I was working there. In my present laboratory, on the other hand, about five out of every six specimens of human or animal blood fail to separate and contract in a satisfactory manner after coagulation. It makes no difference whether the glass vessels are finally washed with distilled or with tapwater before dry sterilisation; and I have been quite unable to find any reason for the difference. Professor G. Dreyer has suggested that it may be due to the fact that the blood specimens in this laboratory come, in a great majority of cases, from inoculated men and animals, while those that I remember at St. Thomas's were nearly all from normal individuals.



When a specimen of blood has been allowed to coagulate and the clot has been left to contract, but no satisfactory contraction has taken place, then it becomes necessary to use some sort of force to separate the clot from the walls of the vessel to which it remains adherent. But the use of force, entailing as it does the introduction of a glass or metal rod into the vessel, is objectionable. For it is impossible to separate the clot thus without breaking it to a certain extent and liberating a sufficient quantity of hæmoglobin to cause some pink or red colouration of the serum. Moreover, the opening of the vessel for this manipulation affords an extra chance that the serum may become spoiled by bacterial contamination.

These considerations, combined with the vexatious delay in the preparation of serum that results from a failure of clot separation, make it desirable to adopt some procedure which may insure the automatic separation and proper contraction of the clot and render mechanical interference unnecessary. The following simple method which was devised for the purpose has given uniformly satisfactory results over a period of six months.

Method.

Into the tubes or cylinders which are to receive the blood a small quantity of melted saline agar is poured. For an ordinary test-tube 1·0 c.c. is ample. The agar is a 1½ per cent. solution in 0·85 per cent. NaCl solution. No alkali is added. The tubes are then plugged and sterilised in the autoclave. Shortly before the tubes are to be used the agar is melted by immersing the lower end of the tube in boiling water and the melted agar is allowed to run up the walls of the tube, so as to coat them with a thin film. The excess of agar may be allowed to run back to the bottom of the tube or, if it be considerable, it may be poured away after removal of the plug.

Either the whole of the inner surface of the tube may thus be coated or there may be left uncoated a longitudinal strip, running from the mouth of the tube down some three-quarters of its length and having a width of about one-third of the circumference of the tube. In the former case the whole clot will detach itself from the glass, and either sink to the bottom or remain suspended by delicate attachments at its upper pole. In the latter case the clot will almost always adhere firmly to the uncoated strip of glass while separating everywhere else. The serum which separates out is practically always free from any visible trace of hæmoglobin, and it may be left in contact with the clot for several days without acquiring a pink tinge. The coagulation of the blood appears to be slightly delayed by contact with agar, and the quantity of serum obtained in a given time is usually rather less than in the case of a perfect automatic separation from a plain glass surface. But both these disadvantages, in themselves not important, may, if desired, be counteracted by placing the tubes in the incubator at 37° C. for one or two hours after collection of the blood. If this has been performed aseptically the high temperature will do no harm. Once coagulation has taken place separation and contraction occur with striking rapidity. The action of the agar film appears to be purely mechanical. The clot adheres firmly to the film and the serum which first exudes from the clot filters through the film or passes through cracks in it and separates the film from the wall of the tube. The adhesion of the agar to the clot is often clearly to be seen at the lower pole of the clot when a plug of agar has been left at the bottom of the tube; for the plug can be seen capping the lower pole of the clot and drawn up by it away from the floor of the tube. The appended drawing shows the results of allowing two portions of the same specimen of blood to clot (A) in an ordinary sterile glass tube, (B) in an agar film tube. The drawing was made after 24 hours. The control tube shows a complete absence of separation of the clot, while the agar film tube shows a separated and well-concentrated clot adherent to a part of the tube that has been intentionally left uncoated.

The question arises whether the serum is in any way affected by contact with the agar film. I can only say that experience has not led me to suspect any deleterious effect of the agar film on agglutinating serum. I have found by experiment that there is no determinable difference between the agglutinin titres of two specimens of the same blood when the one has clotted in an agar-lined tube and the other in a plain glass tube. But this is a point which would need to be taken more carefully into consideration when using this method in the production of therapeutic sera.

Gelatin has a very similar effect upon the separation of blood clot. In fact, it is in some respects better than agar. For instance, gelatin-lined tubes do not so often show an untidy "shreddy" clot as do agar tubes and the coagulation and separation are usually more rapid. But gelatin has the disadvantage of a low melting-point, which makes it a less convenient substance to deal with in hot weather and forbids the incubation of tubes, should this be desired. Moreover, there is at least a theoretical possibility that some digestion of the gelatin by tryptic ferments in the serum may occasionally take place. These considerations have led me to adopt agar in preference to gelatin for routine work.

Experiment to show the Percentages of Serum Obtained after 48 Hours, without Manipulation, from Ox Blood in Variously Treated Tubes.

—	Percent. by vol. of serum obtained. Total.	Percent. by vol. of serum from each of 4 tubes	—	Percent. by vol. of serum obtained. Total.	Percent. by vol. of serum from each
Saline agar tubes.	36·7	34·1 37·5 32·6 38·0	1% peptone gelatin tubes.	40·0	37·5 39·6 38·6 40·5
1% peptone agar tubes.	38·0	37·2 36·9 39·1 38·6	Nutrient gelatin tubes.	38·4	37· 38· 38· 39·
Nutrient agar tubes.	37·0	36·9 36·0 36·0 39·1			
Saline gelatin tubes.	40·0	41·3 39·6 38·6 40·5	Plain glass tubes.	20·6	37· 25· 2· *19·

* The clot in this tube had hardly separated at all; it was mechanically separated half an hour before the test.

The above table shows the quantities per cent. of serum obtained (without manipulation) from ox-blood which had been allowed to coagulate in a number of tubes treated in various ways. A glance will show that the quantity obtainable from tubes treated with three different kinds of agar and three different kinds of gelatin are very similar one to another, and that there is a considerable de-

[3] THE LANCET, August 19th, 1916, p. 315.

of uniformity in the percentages from the individual tubes. On the contrary, from the plain glass tubes a much smaller total percentage of serum was obtained (and this would have been even more striking had not the clot in one of these tubes been separated by manipulation about half an hour before the serum was drawn off). Moreover, the great irregularity of the percentages from the individual tubes—ranging from 37·2 per cent. to 2·2 per cent.—is in clear contrast to the uniformity secured by the agar or gelatin film.

Summary.

The spontaneous separation of blood-clot in glass vessels, and a uniform yield of serum, may be insured by coating the inner surface of the vessel with a thin film of agar or gelatin. For general purposes agar is to be preferred.

A SEBACEOUS HORN.

BY OSWALD VEVERS, M.R.C.S., L.R.C.P. LOND.,
ACTING MEDICAL SUPERINTENDENT, LAVERSTOCK HOUSE ASYLUM.

AN uncommonly well-developed sebaceous horn, the length being 4¼ in., the diameter at base ¾ in., is shown in the accompanying photograph. The spiral shape, site, and general appearance produced a striking resemblance to a ram's horn. The patient, a married woman, was admitted to Bucks County Asylum, suffering from delusional insanity, in September, 1916. During the daytime she was wont to conceal as much of the growth as possible by means of tufts of false hair, from which the free end of the horn protruded in a disturbing manner. The tip was freely movable through about two inches, without causing pain, the whole horn

Photograph showing the sebaceous horn.

moving *en masse* and being inalterable in form by even very considerable force. On grasping the base firmly movement could be elicited over the subjacent frontal bone, but the scalp here was not so freely movable as usual. Mr. L. W. Reynolds, of High Wycombe, informs me that he removed a similar growth from the patient's scalp eleven years ago, and that it "recurred a year later and then broke off," and continues, "whether it is associated with mental disease I cannot say, but the picture in Treves's book has a somewhat demented look about it." It would be interesting to know if any connexion has been traced.

I wish to express my thanks to the medical superintendent, Dr. H. Kerr, for permission to publish the case, and also to Mr. Reynolds, the patient's medical adviser.

Reports and Analytical Records
FROM
THE LANCET LABORATORY.

"CHEVALIER" MALT FLOUR.

(TUCKERS AND BLAKES, LIMITED, ASHLEY-ROAD MALTINGS, BRISTOL.)

THE analysis of this flour was as follows:—Moisture, 10·20 per cent.; maltose, 25·21 per cent.; dextrin, 13·04 per cent.; starch, 31·2 per cent.; protein, 15·75 per cent. (nitrogen = 2·50 per cent.); fat, 1·60 per cent.; mineral matter, 3·00 per cent. (containing 0·80 phosphoric acid). It will be seen that the diastasic process has been well carried out, the starch being largely converted into soluble dextrin and maltose. The flour still showed some diastasic activity. The reaction for enzymes was well marked. The flour was practically free from irritating husk. It has a pleasant malty flavour, and there can be little doubt of its nutritive value and easy assimilability. It mixes with milk very well, forming with it a sustaining and palatable liquid food, suitable for invalid and infant requirements.

CHLOROGEN.

(ARTHUR HYAMS AND CO., LIMITED, 10, ESSEX-STREET, STRAND, LONDON, W.C.)

Chlorogen is described as a water-sterilising solution containing di-basic hypochlorite prepared by Nesfield's process, and is intended for both military and civil use. It is a colourless fluid with chlorous odour. It is decidedly alkaline to litmus paper, the colouring matter of which it rapidly bleaches. On adding a solution of potassic iodide to chlorogen iodine is at once liberated. It is practically free from lime, but contains sodium salts. A marked chlorous odour is developed when it is added to water, 1 drop of chlorogen in 1 gallon being stated to give 1 part of chlorine in 1,280,000 parts. The powerful bactericidal action of chlorine so developed is familiar to all. The chlorine equivalent of chlorogen is well preserved.

COCOA AND MILK POWDER (SWEETENED).

(CADBURY, BOURNVILLE.)

This powder affords a very ready means of preparing a sustaining and nourishing beverage according to the manner directed. We found, as evidence of milk powder being present, 10·28 per cent. of milk sugar. The total amount of materials soluble in cold water was 72·5 per cent., which consisted largely of cane sugar. The total fat amounted to 12 per cent., the mineral matter to 2·50 per cent., nitrogen to 2·12 per cent., and moisture to 1·60 per cent. The flavour is attractive, being partly due to the full cream milk powder employed and partly to the cocoa, but, of course, the powder is decidedly sweet, owing to the cane sugar present.

LIQUOR UNOLINE.

(W. E. LOWE AND CO., LIMITED, 8, STAFFORD-STREET, OLD BOND-STREET, LONDON, W.)

This fluid has been prepared in accordance with a suggestion made by the late Sir Lauder Brunton some years ago that the mineral matters obtained by incinerating willow charcoal might give a more effective salt for medicinal purposes than when the ordinary potassium salts are employed. The salts in the willow charcoal are converted into nitrate by treating their solution with calcium nitrate, when presumably calcium carbonate is thrown out. The preparation has been credited with giving good results in rheumatism and neuritis, and particularly in arterio-sclerosis. On evaporating the "liquor" to dryness we obtained a clean crystalline residue made up chiefly of potassium nitrate, one-half fluid ounce (the usual dose) containing approximately 1 gramme of the salt.

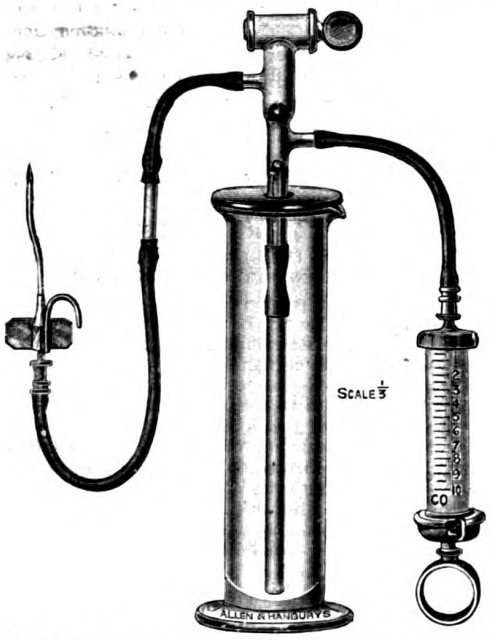
TABLOID HALAZONE (0·004 GRAMME).

(BURROUGHS, WELLCOME, AND CO., SNOW HILL BUILDINGS, LONDON, E.C.)

Halazone is a chloramine derivative associated with a sulphonic and a benzoic group—*p.* sulphon-dichloro-amino-benzoic acid. It was recommended in a recent report to the Medical Research Committee as a most

efficient disinfectant for drinking water. The tabloid halazone dissolves readily in water and develops a chlorous odour. The solution is alkaline and shows marked bleaching properties and easily sets free iodine from potassium iodide solutions. It leaves no unpleasant taste in the water and each tabloid is sufficient to sterilise a litre of ordinary water, but when the water is suspicious the addition of two is recommended, and contact should be allowed to take place for 40 minutes before the water is consumed.

(1) "PATENT" GROATS; (2) "PATENT" BARLEY.



(KEEN, ROBINSON, AND CO., LIMITED, LONDON.)

1. "Patent" groats contain a maximum amount of the nutritive constituents of the oat, while all irritating husk is removed. They are rich in both protein matters (11·7 per cent.) and mineral salts (1·7 per cent.). The special method of manufacture renders them a useful adjunct with milk in infant and invalid feeding. Their value in this respect is most probably assisted by the presence of vitamines and enzymes. 2. This last observation applies also to "patent" barley, which occurs as a fine flour. Barley, of course, contains about half the amount of proteins and fat present in oats, while the easily assimilable starch of barley reaches the figure of 81·5 per cent., the oat freed from husk showing 74·3 per cent. The uses of barley flour both as a beverage and for special dietetic purposes in infant feeding are well known. The starch of barley flour seems more readily digested than that of some of the cereals.

New Inventions.

AN APPARATUS FOR THE INTRAVENOUS INJECTION OF SALVARSAN.

IN view of the increasing importance of modern anti-syphilitic remedies, in the use of which so many medical men are now receiving instruction, it is greatly to be desired that the apparatus employed in such treatment should be of the highest attainable grade. I became familiar with Professor Welchmann's apparatus whilst working at the Virchow Institute, Berlin, but further experience in its use

disclosing several weak points I devised the modification, a sketch of which is appended In practice I have found it very satisfactory.

The essential parts of the apparatus are the two ball-valves (see illustration), the seating of which must be perfect. The function of the upper valve is to prevent blood being drawn from the vein when the piston of the syringe is withdrawn, whilst the lower valve prevents the return of the solution to the receptacle which contains it. The syringe should be filled with solution once or twice and emptied so that all air is expelled. When this has been done, the tube, which has a metal male portion, should be inserted into the socket of the needle. The piston of the syringe should then be drawn in and out until the required quantity of solution has been injected into the vein. The apparatus is easily sterilised by boiling and it is sufficiently portable to be carried in an ordinary inside coat pocket. In the sketch a glass cylinder is shown, but any kind of receptacle can be employed, such as a tumbler, &c. The quantity of fluid to be injected can be accurately gauged within wide limits. For instance, if 600 c.c. of salvarsan solution is prepared in a large glass flask 100 c.c. can be injected into six patients by simply changing the needle each time. A special advantage in the construction of the needle is that after insertion into any vein it will rest on the arm parallel with the surface. When working alone the instrument can be easily manipulated, one hand being kept on the needle, whilst the other is used by means of the ring in the piston rod, to work the syringe. I have found this form of needle preferable to any other pattern, both for entering the vein and for remaining in position after insertion. In the course of my work as pathologist at Netley I had to inject salvarsan into many dark-skinned soldiers (Indians), whose veins are difficult to see, and this form of needle then proved very useful. The apparatus can also be employed for the injection of saline solution.

Messrs. Allen and Hanburys, Wigmore-street, W., are the makers.

Knightsbridge. M. J. ROWLANDS, M.D. Brux., M.R.C.S.

A CRUTCH-LIMB.

FROM his experience as consulting surgeon to an army corps Professor v. Baeyer (Ettlingen) has evolved a very

simple form of prosthesis[1] for amputations of the leg, which may be regarded as something between a crutch and an artificial limb. He calls it a "seat-stick," but probably the compound word "crutch-limb" will suggest the device better to the English reader.

The crutch-limb consists of a stick expanding above into a flat board, to the top of which two girdles are attached, a pelvic and a shoulder, both of adjustable length. The illustration sufficiently shows its method of application. The device leaves both hands free, and avoids the necessity of axillary support with its dangers of nerve compression. Professor v. Baeyer states that the crutch-limb has become highly popular in his orthopædic reserve hospital.

A GREAT ADVANCE IN THE TREATMENT OF BURNS

SLIGHT or SEVERE.

AMBRINE

(Method of Dr. BARTHE DE SANDFORT.)

AMBRINE **instantly alleviates pain, promotes rapid healing, forms a sure Protection against Infection of the Wound.**

Although the **dressing** with AMBRINE is occlusive and adhesive, it becomes after a short period non-adhesive, **and can** be removed without pain, hæmorrhage, or injury to the newly forming tissues. The healing **takes** place without leaving scars or contraction.

SUPPLIED TO:—The British Navy, French Ministry of War and Marine, The French Red Cross, The Italian, Belgian, and Roumanian Governments, The French Railway Companies, The Carnegie Trust Company, U.S.A., &c.

INDICATIONS for the Use of AMBRINE:—

BURNS	CHILBLAINS NEURITIS	VARICOSE ULCERS PHLEBITIS	NEURALGIA RHEUMATISM	SCIATICA GOUT, &c., &c.

The BRITISH MEDICAL JOURNAL, Sept. 2nd, 1916:—

Re AMBRINE TREATMENT.

"..... The primary and quite incontestable advantages of the treatment are two: it is agreeable to the patient, because entirely painless; it is convenient to the surgeon, because easily and quickly applied. ..... It is possible that the treatment would be useful in dealing with ordinary ulcers, and in any case it is certain that the study of its application to the raw surfaces is worth pursuing. ....."

THE LANCET, June 10th, 1916:—

THE VALUE OF AMBRINE IN THE TREATMENT OF WOUNDS.

"Attention is being drawn to the remarkable success of the Ambrine Wax treatment now being used at the Hôpital St. Nicolas at Issy-les-Moulineaux for burns, frozen feet, and all wounds where the tissues have been so damaged as to exact great length of time and considerable disfigurement in their restitution by the usual means. The Minister of War, in reply to the deputy M. Mons as to why, in view of the marvellous results obtained by treating burns and frost bites with Ambrine at the Hôpital St. Nicolas, all the soldiers suffering from such wounds were not sent there, stated that this was being done as far as possible. ..."

With AMBRINE treatment no waste of the material takes place—sufficient only being prepared for each application as required.

The SCIENTIFIC TREATMENT of HAY FEVER & allied ailments.

KINECTINE

According to Dr. MOUNEYRAT, the discoverer of Galyl (the widely adopted Salvarsan Substitute).

FORMULA.—Chlorhydrate of Quinine c. Hectine—i.e., *Benzo-sulfone-para-amino-phenyl-arsenate of Quinine.*

Non-toxic, produces no ill results. Easily taken (tablets) and well tolerated.
Highly satisfactory clinical results.

As a prophylactic against Hay Fever, &c.

Rapid abortive action in the initial stages.

Curative action in the Advanced and Chronic conditions.

LITERATURE ON APPLICATION.

THE ANGLO-FRENCH DRUG CO., LTD., GAMAGE BUILDING, HOLBORN, LONDON, E.C. 1.
Telephone: HOLBORN 1511. (Late M. BRESILLON & Co.) Telegrams: "AMPSALVAS, LONDON."

ELECTRIC COLLOIDAL METALS

Employed by leading Physicians and Surgeons and in the Hospitals of France, Great Britain, &c.

Special GOLD MEDAL at the International Congress of Medicine, London, 1913.

ELECTRARGOL

(*ELECTRIC COLLOIDAL SILVER*).

For Hypodermic Injection—
Boxes of 6 tubes of 5 c.c. Boxes of 3 tubes of 10 c.c.

For Surgical use—Bottles of 50 and 100 c.c.

THERAPEUTICAL INDICATIONS:

All infectious diseases and in particular **Pneumonia, Bronchopneumonia, Typhoid, Typhus, Tetanus, Measles, Variola, Septicæmia, Scarlatina, Cholera, Erysipelas, Malta Fever, Acute Meningitis, &c.**

LOCAL APPLICATIONS:

Septic Infections of Wounds, Mammary abscess, Epididymitis, Orchitis, Whitlow, Furunculosis.

ELECTROSÉLÉNIUM

(*SÉLÉNIUM*). Boxes of 3 tubes of 5 c.c.

Treatment of Cancer.

ELECTROCUPROL

(*COPPER OXIDE*).

Boxes of 6 tubes of 5 c.c. Boxes of 3 tubes of 10 c.c.

Cancer, Tuberculosis, Infectious Diseases

ELECTR-Hg (ELECTROMERCUROL)

(*MERCURY*). Boxes of 6 tubes of 5 c.c.

All forms of Syphilis.

ELECTROMARTIOL

CLIN LABORATORIES — PARIS.

SANITAS

MEDICAL POINTS.

TORPID ULCERS speedily heal when treated with "SANITAS JELLY."

WOUNDS OF ALL KINDS are best washed with "SANITAS FLUID," which contains Peroxide of Hydrogen allied with other germicidal substances.

INFECTIOUS SORE THROATS are prevented and rapidly recover by gargling "SANITAS FLUID" and warm water (1-3).

PEELING STAGE OF INFECTIOUS DISORDERS.—Sponging with "SANITAS FLUID" (1-3) is strongly recommended.

ANTISEPTIC FOR SURGEONS.—Our "SANITAS SYPOL" is an improvement on the German Lysol.

BODY VERMIN.—"SANITAS ANTI-VERMIN PASTE" is a simple, safe, and effective remedy.

MUSCULAR RHEUMATISM AND LUMBAGO are speedily relieved by application of "POTEX," our new scientific potato preparation.

HAY FEVER.—Great relief is obtained by smearing up the nostrils, &c., with "KAYTOR," our new scientific preparation.

PRURITUS can also be frequently relieved by the application of "KAYTOR."

MOUTH AND TEETH WASH.—The most effective agent for this purpose is "SANITAS FLUID," which acts both as an oxidising agent and antiseptic.

FUMIGATION OF INFECTED APARTMENTS is best carried out by means of "SANITAS FORMIGATORS" or "SANITAS SULPHUR CANDLES."

The "SANITAS" CO., Ltd.,

LIMEHOUSE, LONDON, E.

Disinfectant Manufacturers, by Appointment, to H.M. THE KING.

THE LANCET.

LONDON: SATURDAY, JULY 14, 1917.

Air Raid Psychology.

IN certain schools of biological thought a favourite theme is the phylogenetic adaptation of the organism to repeated sense stimuli of a given type, whereby appropriate reflex action, by way of defence or otherwise, is installed. By thorough-going exponents of these views it is held that since high-velocity projectiles are a recent development in warfare the sense organs have not become adapted to such stimuli, hence they cannot react; in other words, wounds thus produced are painless, at least at the moment of contact. Aerial bombardments of crowded cities are a still more recent development of "civilised" warfare, and, *ex hypothesi* the individual must be even less adapted to such stimuli than in the former instance. What, then, of his behaviour at such moments? Any thoughtful consideration of the subject will lead to the conclusion that various psychological factors are involved and that a distinction may be drawn between the response of the individual and that of the crowd. Man is still largely an instinctive animal and only a little bit reasonable; his intelligence may point the better way but innate trends may prevent his following it. Instincts have different strengths in different individuals and different races, yet probably the most general and the most powerful is that of self-preservation. This is called into being by the emotion of fear, and tends to express itself either in flight or in concealment, or both. The more unusual, strange, unfamiliar the exciting stimulus, the more overpowering is the instinct likely to prove—*Omne ignotum pro magnifico* is a very old saying, but also a very true one. When, therefore, without warning, a bomb drops from the blue in a crowded thoroughfare to dash for the nearest shelter is as instinctive an act as for the puppy to hunt the first rabbit that crosses its path. Further, what is strange also excites the instinct of curiosity, which, once aroused, may come into conflict with the other instinct; and recent experiences undoubtedly go to prove that at its bidding the individual may brave the risk and ignore the call of self-preservation.

But other psychological factors, other psychical stimuli, come into play and jostle each other for possession of the final common path that leads to action. With increasing knowledge our behaviour becomes more and more rational; and, after the first momentary instinct to flight, a glance at the sky may reveal the reassuring fact that the bomb-droppers are not directly overhead, and at once the stream of action is determined in another direction. Or the individual may have run the gauntlet on a previous occasion and, profiting by his experience, ignore both fear and curiosity. The citizen who hears the cry of "Zeppelins!" and turns over muttering, "I wish they'd let me sleep," is not acting in a spirit of bravado, but according to a psychological law. Further, anger or pity is an emotion that may oust fear or curiosity and determine the individual's conduct. And yet again, what of such stimuli as self-control and sense of duty? Whatever the policeman's first instincts may be, no one who has seen him directing the current of humanity to safety at these anxious moments can doubt the motives which actuate him. The crowd, however, as has been acutely pointed out by GUSTAVE LE BON, is something more than a congeries of individuals. It is apt to be swayed by certain stimuli, just as it possesses certain psychological characteristics, to which the individual is a stranger. A crowd is apt to be impulsive, mobile, unstable; in it the heterogeneous is swamped by the homogeneous. Fear may be felt by the individual, but panic is a crowd-phenomenon. On the other hand, crowds may exhibit praiseworthy features, may demonstrate the ruling activity of virtues, whose rôle in the behaviour of the individual may be less easy to detect. Above all, what has often been regarded as a fundamentally important factor, that of race, is seen *par excellence* in the response of the crowd to stimuli of the character that we have become familiar with since the outbreak of the war. From a psychological viewpoint it is instructive and not a little entertaining to glance over the comments of the lay press after such experiences as have recently been ours in London. It may be remembered that after the raid of Sept. 2nd, 1916, when an enemy airship was brought down in flames, a daily paper next day described the sight as "beyond doubt the greatest free show that London has ever enjoyed." No doubt thousands, who had satisfied themselves that they at least were safe, positively "enjoyed" the whole thing, and forgot the acute mental distress and anguish of the actual sufferers of the raid. Sometimes anger is uppermost, as when a well-known writer declares the mothers of England "will not long consent to sit silent with their arms tied behind their backs." Another publicist, irritated at the frequency with which the "calm" of the public is insisted on, candidly protests, "It is only oysters who are not rather frightened when bombs are dropping round." There is no inconsistency in these varying comments, all of which are fair.

A large out-patient department of a hospital serving a raided district is an excellent place in which to learn what the effects on the attacked population really are. From this experience, more than once repeated, we believe in the traditional British phlegm, and we think it no exaggeration to assert that our public, as a whole, is calm and its conduct exemplary. He would be rather less than human whose heart does not beat more quickly when the guns indicate the proximity of the invader, and in the bombed areas there are many whose state of nervous fear is not far removed from the "shell shock" of the firing line. Between these, whose temperaments are of a nervous type, and others who, even in the danger area, may pride

themselves on their sangfroid and nonchalance, there remain the crowd of our fellow human beings animated by a diversity of instincts and motives, and pursuing a course determined by that stimulus which may attain the final common path and blossom into action. How different these psychical stimuli are we have sufficiently indicated, and how well, on the whole, reason has prevailed we are proud to record. We made a brief investigation into the demeanour of the inmates of the metropolitan hospitals during the last and severest air raid on London. A summary of this will be found on another page,[1] and shows that the hospital patients, obviously susceptible material to sudden shock, under good supervision remained calm. Nor do medical men hear much of subsequent apprehensiveness, sleeplessness, reaction in the form of fatigue, collapse, or breakdowns. Some of us know of the fits, hysterical and epileptic, that take on a fresh development, the strokes of paralysis from excitement, the heart failures, the acceleration of latent pathological processes, but these have not been common occurrences. And in the great majority of our fellows we believe the evidence before us shows their demeanour under stress to have been unimpeachable, and to augur well for whatever days of trial may yet be in store.

War Bread.

THE Ministry of Food have dealt frankly with the criticisms that have appeared lately as to the unpalatability and indigestibility of war bread—the former is admitted and the latter is not denied where baking has been faulty. We learn from an authoritative source that applications are reaching the Ministry of Food for permission to use pure wheat flour. Up to the present date the numbers of these applications have not been large, but they may grow to such an extent that more careful scrutiny will have to be made before granting them. The medical profession will render the country an undoubted service in cöoperating with the Ministry of Food to prevent an abuse of the privilege. In appealing to them to do this it may be pointed out that complaint is by no means general, the applications coming in much larger proportions from certain districts than from others. Thus Hampshire, Yorkshire, Lancashire, Lincolnshire, and Cornwall furnish 64 per cent. of the total number of applications from England, with less than one quarter of the total population.

A committee of scientific experts have instituted, at the instance of the Food Controller and by arrangement with the Wheat Commission, a series of experiments on the digestibility of war bread and the advantage of milling to various standards. The experiments are not complete, but we may look for an improvement of conditions as a result of the work. The Ministry of Food admitted at a press conference held in Grosvenor House on Tuesday last that certain millers have not yet succeeded in properly adapting their equipment to the existing orders, with the result that badly made flour has been used in certain districts. On the other hand, most of the mills have overcome the difficulties which at first presented themselves, and are now producing good and wholesome flour from mixed grain. War bread has not yet become a uniform commodity; but that it has been produced in enormous quantities in many districts with differing populations, and without a complaint arising, shows that the system of obtaining a palatable and digestible war bread merely awaits further development. The rapidity of this development will largely depend upon the attitude of the miller and baker, and when these important persons follow intelligently the directions supplied them for producing a good flour and bread respectively from mixed grain, then a food that is good both in texture and condition may well be hoped for. It must be admitted that both the miller and the baker have considerable difficulties to contend with in the production of palatable bread which will keep under present conditions. To the miller is set the problem of producing from maize and other cereals, with, in many cases, imperfect machinery, grades of flour which will blend satisfactorily with wheat, and flour containing more of the outer part of the grain than formerly. To the baker is set the problem of baking bread from a composite flour which differs in properties from that which he has been accustomed to handle. On the whole, both the miller and the baker have met these difficulties remarkably well, and there can be little doubt that, with further experience, the troubles will be completely overcome. That a palatable and nourishing bread can be produced which complies with the orders of the Ministry of Food is quite certain. The importance of this statement cannot be over-estimated: it is a confident message from those who know, and may be accepted at its face value. And the message means nothing less than this: the nation can be saved from bread famine by complying with the directions laid down and the precautions taken. The fact is well worth bearing in mind by those who are tempted to grumble. The suggestion is not that *half* a loaf but that a *whole* loaf is better than no bread at all. Such a change in the composition and texture of our daily bread as is enjoined by the orders of the Food Controller was bound to lead to dissatisfaction in many quarters, but every endeavour is being made to minimise the sacrifice which, to some extent, the consumer is asked to make. As time goes on war bread will improve rather than deteriorate; the further attention given to the special requirements of its preparation will assuredly have good outcome.

Questions like ropiness, mouldiness, staleness, and hardness of certain war breads are all being rapidly and seriously dealt with by competent experts. In the meantime no uneasiness need arise. Ropiness, for instance, is a fermentation due to a bacillus parasitic on grasses, and quite harmless to man or other animals. With the coöperation secured of the miller and baker, no reasonable ground for complaint can arise, while it should be a source of satisfaction that a general acceptance of war bread means robbing the enemy of a weapon

[1] See p. 59.

which he appears to look upon as infallible. The complaints received very largely reflect the fact that this is the third year of an unprecedented war. The country is in a state of siege and the supply of wheat is not enough to provide all the bread needed. Admixture of other cereals less adapted than wheat to bread-making is an actual necessity of the country, and one of the most serious responsibilities of the medical profession is to assist the administration by checking the flow of uncalled-for complaints. The relation of Government regulation bread to the health of the community is under the earnest consideration of a committee of the Royal Society.

Annotations.

"Ne quid nimis."

MENTALLY DEFICIENT OFFENDERS.

THE Report of the Howard Association for 1916 calls attention to the large proportion of physically and mentally deficient persons now in prison, and quotes from the Prison Commissioners' Report for the same year the statement that "one of the notable effects of the war on the prison population has been that the receptions are now, for the most part, confined to the physically and mentally weak." Seeing that the male population of the prisons is less than one-half of what it was the year before the war, the existing proportion of defectives is, of course, easily accounted for. Probably but few of the *floating* population of men of military age who in times of peace inhabit the local prisons for more or less short periods have not either volunteered or been recruited when deemed fit for military service of some kind. As regards the "mental defectives," there are doubtless many more of this class in prison, both now and before the war, than the 204 who were stated by the Prison Commissioners in 1916 to have been certifiable as such under the Mental Deficiency Act. Commenting on these facts, the Howard Association pertinently asks: "Why is it that mentally defective offenders are admitted to prison at all, and what is the use of certifying them as mentally defective if they are to be released, as was the case last year?" And the Association correctly replies to these questions that "it is the law of the land, and that there is nowhere else than prison for these offenders to go." The remedy, or at least an initial remedy, for this undeniably deplorable state of things, now suggested by the Howard Association, is that some of the prisons which have been closed or otherwise used during the war should be devoted to the segregation of mentally defective prisoners, in the interests of society and of the half-witted individuals themselves. We think that this suggestion involves a total misconception of the existing difficulty. As long as institutions properly adapted for the segregation, cure, and employment of mentally defective persons are unavoidable it would be worse than useless to transfer the patients at this time to small prison buildings—for it is mainly the small prisons which are empty—where nothing could be done for their benefit. No possible good of any kind could result beyond the convenience of confining them until suitable places were found for them. Such prisoners would be far less better off than they are now, and the suggested scheme could not be tolerated with only the general welfare of society in view. At present all that has been done, since the passing of the Mental Deficiency Act, for the care and control of mentally deficient offenders who are unfit for prison discipline is the establishment of an institution for women only. The Board of Control, which is now responsible for carrying out the provisions of this Act, has not as yet supplied accommodation for male defective offenders, although, even before the war, a prison which could have been rendered approximately suitable for a time was placed at their disposal by the Prison Commissioners. It may be said here, also, that before the passing of the Mental Deficiency Act the prison authorities made several endeavours to minimise the re-admissions to prison of mental defectives by informing the local police of all such prisoners discharged into their districts, in order that they might be brought before the notice of the local authorities and appropriately dealt with when found to be uncared for; but practically no regard was taken of such information. It seems to us that the prison authorities, who were among the first to press strongly on the Government more than 12 years ago the necessity for legislation in order to provide for proper care and control on discharge of prisoners who were found quite unable by reason of mental defect to shift for themselves, should not be saddled with the responsibility of directing asylums for either the mentally or the physically defective. Whether wisely or not the law has apportioned this duty to a Board of Control mainly composed of the former members of the Lunacy Commission, and it is rather for this Board than for the Prison Commission to make reply to the questions asked by the Howard Association.

THE TREATMENT OF SCIATICA BY APPLICATION OF STRONG HYDROCHLORIC ACID.

Dr. Harrington Sainsbury has described in THE LANCET of June 16th remarkable results from the treatment of neuritis, and particularly of sciatica, by the application of strong hydrochloric acid to the skin along the line of the inflamed nerve. He ascribes the treatment to Dr. Hugh Wingfield, but we may point out that it is not new and was noticed in our columns nearly 20 years ago[1] in an annotation on an article which was published in the *Semaine Médicale*. We may recall the circumstances, as this valuable remedy seems in the interval to have been almost completely forgotten. Moreover, the manner of its discovery is interesting. This was due to an accident founded on a blundering ignorance of chemistry. A man who had suffered for many years from sciatica was treated in an Algerian hospital by hypodermic injections of salt and water, but without much success. After he had left he bethought him that perhaps the salt was not strong enough and that a stronger preparation of salt might be successful. He therefore procured some "spirit of salt" (strong hydrochloric acid) and painted it on the skin. He got rid of his long-standing trouble in a few days. Shortly afterwards he attended the hospital for some other affection, and confided in Dr. Bourlier, professor of therapeutics, whom he saw, how he had got rid of his sciatica. Dr. Bourlier thought the plan worthy of trial, and employed it in several cases with invariable success.

[1] THE LANCET, Nov. 20th, 1897, p. 1338.

A thesis was then published on the subject by Dr. C. Gennatas, of Montpellier, on the basis of a dozen cases of sciatica, all of which were completely relieved by this means. As far as we know, only one paper on the subject has been published in this country. After the appearance of our annotation Mr. R. A. Bayliss reported 16 cases of sciatica treated by application of hydrochloric acid over the course of the sciatic nerve.[2] In most instances they had defied every other treatment. Two patients were completely cured, 11 were considerably relieved, and 3 did not improve. He also treated 10 cases of intractable pain in the heels and plantar region, the sequelæ of acute rheumatism, many being gonorrhœal. Four of the patients were quite cured, 1 was very much relieved, and 5 were not improved.

A DEFENCE OF HYPO-NUTRITION.

AN impartial study of the effect of lowered nutrition on a large unselected population would be of great interest at any time, and especially now when the food blockade is a recognised form of warfare. At a recent military-medical meeting in Berlin Professor Klemperer summarised the results of some hospital observations, probably made at the Moabit Hospital, of which he is director in peace times. No one, he says, need feel ill merely because he is thin, since a loss of 10–20 per cent. of his peace-time weight is normal. Except to manual labourers a reduction of the musculature makes no matter. Per head of hospital population not more than 1500 calories are available, amongst which milk and eggs are still included, but practically all diseases heal without delay, even when the protein intake is diminished. Professor Klemperer goes on to consider war bread. Made with 94 per cent. of flour containing much gluten it is tolerated by a surprisingly large number; even the cellulose is utilised in consequence of the formation of new intestinal ferments. The increased vitamine intake has resulted in a vigour new to many folks and a corresponding disappearance of constipation and neurasthenia. Gout and diabetes have also greatly diminished. On the other hand, Professor Klemperer noted an increased severity in the cases of tuberculosis coming up as out-patients, many of whom had seen active service, and also in affections of the blood-vessels owing to the physical and mental strains of warfare.

THE PARASITOLOGY OF PYORRHŒA ALVEOLARIS.

IN recent years the clinical effects which are supposed to result from pyorrhœa alveolaris and the causation and treatment of the disease have received a good deal of attention and been the subject of much experimental investigation. The difficulty has been to distinguish amongst the crowd of micro-organisms present in the pus from the alveolar pockets those which were primarily responsible for the lesions and those which were merely secondary infections. These latter, however, may be, and probably are, of great importance in the causation of symptoms. Attention has been drawn to the almost constant presence of amœbæ in the pus, and the disease has been attributed to their action, but on the whole the balance of opinion is against the view that they are the cause of pyorrhœa. It is true that amœbæ are nearly invariably to be found, but there does not appear to be any connexion between the severity of the disease and the number of amœbæ, nor has inoculation of the purified organism in animals or in the tooth sockets of the experimenters themselves produced any characteristic lesions. With this conclusion Dr. Aubrey H. Drew and Dr. Una D. Griffin, in the April number of the *Journal of the Royal Microscopical Society*, appear to agree. Taking advantage of the large amount of material passing through their hands at the Dental Hospital, they have investigated very fully the parasitology of pyorrhœa, and have described some interesting phases in the life cycle of the amœba and discovered what they believe to be new species of flagellates. In conjunction with Dr. Penfold they attempted, though without success, to obtain a lytic serum by the injection into animals of pure cultures of amœbæ which by their technique they had succeeded in obtaining from the pus. These cultures were able to produce abscesses containing living amœbæ when inoculated subcutaneously in the guinea-pig. No complement-fixation bodies could be detected in the patient's blood serum when alcoholic and saline extracts of the amœbic cysts were used as antigens. The important observation was made that cysts which closely resembled the form described as *Entamœba minuta* are found in the fæces of pyorrhœa cases, and might give rise to error in the diagnosis of dysentery; these cysts are believed to be those of *E. gingivalis*. The investigation was not mainly concerned with the clinical aspect of the question, but it was noted that emetine was of no value in treatment. Mechanical injury was thought to play an exceedingly important part in the commencement of the disease, which almost invariably starts as a marginal gingivitis. Following the injury the spirochetes, such as *Sp. vincenti*, appear to play the chief part in the disease, causing destruction of tissue and the formation of pockets in which pyogenic cocci and other organisms find a good breeding-ground where toxin formation and absorption can go on continuously.

ANGLO-SAXON MEDICINE AND THE ORIGINS OF FRENCH SURGERY.

ON Anglo-Saxon medicine Dr. Charles Singer throws light in an erudite monograph reprinted from the Proceedings of the Royal Society of Medicine and entitled "A Review of the Medical Literature of the Dark Ages, with a New Text of about 1100." Throughout the period prior to the twelfth century, when the translations from the Arabic writers, which afterwards so largely influenced mediæval medicine, had not yet permeated Europe, the Anglo-Saxons would seem to have stood practically alone among medical authors outside the pale of Latin or Romance Europe. Some 89 vernacular medical texts in Teutonic, or, as we should prefer to say, Nordisk languages, have been reprinted by Professor Sudhoff, and of these, as Dr. Singer points out, "not more than thirteen are earlier than 1100, and of the thirteen all save three or four and all the longer texts are English." Chief among these texts is the "Leech Book of Bald," probably written in the first half of the tenth century. This contains only herbal remedies with the conditions justifying their employment. Dr. Singer says:—

"The general characteristic of this Anglo-Saxon literature is the wide knowledge of herbs which it displays, together with the extreme simplicity of its pharmaceutical processes. There are no anatomical descriptions, there is no attempt

[2] Brit. Med. Jour., Nov. 19th, 1898, p. 1550.

to separate diseases from symptoms. The pathological condition is named and the remedy follows (as in the περὶ δόδαξίων or the Leech Books), or the herb is named and the symptom follows (as in the first part of the Herbarium of Apuleius)."

The text reprinted in Dr. Singer's pamphlet is the medical portion of the Scientific Encyclopædia of the Twelfth Century, contained in a MS. in the Library of St. John's College, Oxford. The work as a whole is perhaps the earliest known encyclopædia. It is couched in an often surprising latinity, and affords a good idea of the state of knowledge at the time of the Norman Conquest. The medical portion of the compendium deals with the constitution of the body in relation to the four humours, the regimen of the four temperaments, phlebotomy, prognostication of life and death, herbs, weights, measures, electuaries, plasters, an Anglo-Saxon charm to stop bleeding of the nose, the relation of fevers to the humours, the principles of pathology, panaceas, remedies, and the diseases to which they are applicable. In all this there is no word of surgical technique, even in the case of bleeding, or of surgical instruments, which, as Dr. Singer points out in a further learned account of the Guy de Chauliac MS., preserved at Bristol, were not figured in diagrams before the thirteenth century. Guy de Chauliac's MS. belongs probably to the period between 1420 and 1435, when John, Duke of Bedford, was Regent of France. The document was apparently written for presentation to him by Jean Tourtier, Master in Surgery. It contains eight miniatures, reproduced by Dr. Singer, representing various operations. We have here the origins of modern surgery. In one picture, for instance, an inguinal bubo is being opened, in another a fractured limb is being put into splints. Phlebotomy is practised as at a much later date, the patient holding a surgeon's staff of the kind still seen over barbers' shops, while blood pours from his right arm into a bowl. The pictures of ancient trephining instruments are of great interest, as are also others representing cauteries and gouges, but the modern instrument maker is not on familiar ground here as he would find little to suggest the evolution of his work.

ERRATUM.—In a note last week on the debt of medicine to the discovery of dyes an obvious misprint occurs, a negative having been omitted. We speak of the possibility of finding selective substances "which are inimical to the human organism"; the sentence should be "which are *not* inimical, &c." The context has probably prevented any misunderstanding.

THE LANCET, VOL. I., 1917: THE INDEX.

THE Index and Title-page to the volume of THE LANCET completed with the issue of June 30th are now ready. Owing to the continued shortage in the paper-supply, the Index will not be issued with all copies of THE LANCET, as was the custom prior to the War. Subscribers who bind up their numbers are requested to send a post-card to the Manager, THE LANCET Office, 423, Strand, London, W.C. 2, when a copy of the Index and Title-page will be supplied free of charge.

THE METROPOLITAN HOSPITALS AND THE AIR RAID.

HOSPITALS have a special and severe responsibility upon them in the event of air raids, as they have to provide for the protection of an aggregation of individuals, any or all of whom may be affected in ways that preclude opportunity being taken of ordinary precautions. For some patients the attacks add to a mental depression already upon them, while for others the physical disabilities increase the sensations of terror by the knowledge of abnormal helplessness. In these circumstances it is necessary that complete arrangements should be made in advance, not only for warding off danger as far as possible, but for keeping the unfortunate charges of the institution in good heart.

From an inquiry we have made at various of these institutions in the metropolis it is certain that the authorities have fully recognised their onus, that their staffs, medical and institutional, dealt with an anxious situation calmly and promptly, and that everywhere the note of readiness removed the worst concomitant of an air raid—namely, panic. It is noteworthy—though surprising only to those who are unfamiliar with the courage characteristic of hospital inmates in all circumstances—that the patients played their part splendidly; men, women, and children alike remained, almost without exception, calm and reliant upon the help that could be afforded them.

The following are notes made at the various hospitals:—

St. Bartholomew's Hospital.—There was no panic either among men or women. The nursing staff were able to keep those in their charge well under control, and no lasting bad effect from the severe strain was noticed even among the medical cases. The precautionary arrangements worked without a hitch.

Charing Cross Hospital.—The calmness of the patients was wonderful. Two girls cried, but no one else showed any emotion.

St. George's Hospital.—The patients remained perfectly calm and there did not appear on the surface to be any great difference of demeanour in the behaviour of the sexes. The main idea seemed to be curiosity and an endeavour to ascertain what was happening. Certainly there was no question of fear. The special arrangements made at the hospital, both for the treatment of a large number of emergency casualties and also for the speedy removal of patients, if necessary, from any part of the hospital, worked very satisfactorily.

Guy's Hospital.—A member of the staff, who was engaged with out-patients at the time of the raid, reports the demeanour of the patients to have been very good indeed. "Though naturally a little restless and anxious, in no way was there a tendency to panic. One woman commenced to cry but was soon reassured. I allowed my patients and the ordinary casualty patients to smoke; they appreciated this and there was no difficulty in controlling them. In my special department where nervous manifestations might have been expected, none occurred. One man who had his leg amputated on the occasion of the air raid on June 13th, when he suffered considerable shock, showed similar symptoms and cried like a child for four or five hours afterwards. The patients admitted immediately after the raid showed no signs of panic, and arrangements were quickly in hand for coping with large numbers of accidents, the junior staff and the nursing staff working admirably. I remember my head nurse's face, which said simply, "All this air-raiding is a nuisance." I had on this occasion no difficulty in getting the students to seek cover.

London Hospital.—The steady behaviour of the patients during Saturday's air raid, which has marked every raid since the Zeppelin days, was again manifested. There was no noticeable difference in the demeanour of the male and female patients, but the patients still with us who were admitted after the raid of a month ago were more terrified of this raid than any of the other patients. The arrangements made at this hospital for air raids are of the most minute and elaborate character, both in regard to the inmates and in regard to the reception of new patients, the various resident medical officers being assigned to different sections of the huge hospital with the special duty of quelling all panic and taking charge of the removal of patients should occasion occur.

St. Mary's Hospital.—During Saturday's air raid the behaviour of the patients in this hospital was excellent. The women and children, as well as the men, were calm and self-possessed, and ready and willing to submit themselves to the arrangements made by the hospital for their safety. These arrangements were all in working order.

Middlesex Hospital.—All the patients, male and female, behaved admirably during the air raid on Saturday last. That they maintained their self-control so well was largely due to the example set them by the sisters and nurses, who proceeded with their work in the ordinary way, thus inspiring the patients with confidence. This has been the case in all previous raids both by day and night. All the arrangements worked satisfactorily.

St. Thomas's Hospital.—Throughout the raid the patients behaved extremely well, though there were one or two cases of mild excitement; some of the bed-ridden soldiers were nervous, but the majority of the patients who were able to do so stood ready to give aid if occasion arose. There were some isolated cases of out-patients being nervous, but the vast majority were only anxious to see something of what was going on. The sisters and nurses of the hospital are now so used to alarms being given that they regard the whole proceeding very calmly and are thereby able to reassure their patients. The most excitement was

shown by some out-patients in the casualty department and other persons from outside who came into the hospital for shelter. These were all sent down into the basement where they remained quiet until all danger was passed. The hospital and the medical and surgical officers in attendance were prepared to meet any emergency, and there is a good supply of extra beds which would at once be sent to the wards for the accommodation of any cases brought in as a result of the raid.

University College Hospital.—The patients remained calm, the female as well as the male, and the hospital arrangements in case of emergency worked satisfactorily.

Westminster Hospital.—The patients remained perfectly calm and it was not observed that either sex was specially affected. "Nervous" cases of both sexes were somewhat upset, and some "heart" cases showed increased symptoms—rapidity of pulse, and so on. All other patients, medical and surgical, preserved their coolness excellently. The medical and nursing staffs went at once to assigned posts, their discipline being the main cause of the calm manner in which the situation was met by the patients.

The Hospital for Sick Children, Great Ormond-street.—During the raid there was no trouble whatever with the children in the wards nor with the nursing staff. The out-patient department was full at the time, and at the first sound of guns from the anti-aircraft section all the mothers and children were sent to the basement. Very few of the mothers were upset, and they were foreigners.

London Fever Hospital.—The behaviour of the patients was excellent. No cowardice was manifest. The boys with scarlet fever, with the exception of one boy who cried, took to active vocal verbalisms derogatory to the "fat-heads," "square-heads," and "pigs of Germans." Such of the female patients as could rise went to look at the fleet passing over the hospital, but one took refuge under her bed and another in a coat-cupboard. No other nervous manifestations were noticed among the patients. The medical superintendent of the hospital sends us this significant note: "I think that an anticipation of disaster was felt by most, but that they were all too proud to betray their fears by emotional manifestations."

Some of the hospitals were of course more tried than others, although for obvious reasons we refrain from indicating which. Our purpose is to show that a particularly vulnerable section of the population preserved their calm in a time of great trial, and that a well-thought-out organisation played the part assigned to it.

THE CONTROL OF VENEREAL DISEASES.

Enlightenment Campaign.

A cinema film entitled "Es werde Licht!" (Let there be light!) is being exhibited in the German cities, showing in dramatic form the misfortune which an individual suffering from syphilis can bring to his family as a result of his carelessness or his ignorance of the danger. The film is issued with the support of the German Society for Combating Venereal Diseases, and is compared by the *Münch. med. Wochenschr.* to the drama "Die Schiffbrüchigen," the German for "Les Avariés," of which an English version, entitled "Damaged Goods," continues to attract large audiences at the St. Martin's Theatre, London. The German film is said to be very impressive in spite of its undue length, the physician taking leave with the words "I have done my duty," after seeking without success to dissuade his syphilitic brother from contracting a marriage, and leaving the audience to draw the conclusion that in leaving his brother's unsuspecting fiancée to her fate the physician has by no means done his duty as judged by modern standards. The same conflict between professional and social motives comes out also in "Damaged Goods," in which, however, Brieux has drawn the rôle of the doctor on lines which command throughout the assent of the audience. The play might have indeed been written for an English audience of advanced thought except for the unfortunate statement made by the doctor, and not challenged, that not more than four out of every thousand young men have failed to run the risk of contracting syphilis. It is impossible to exaggerate the educational value of such plays and films as these, and Brieux may be regarded at the present time as a main agent in bringing the evils of unchastity before the youthful population of London.

The Early Preventive Treatment of Venereal Diseases.

We have been reproached during the last few months with, on the one hand, rendering accessible to those who wish to make use of them the means of indulging in promiscuous sexual intercourse without risk of contracting venereal disease; and, on the other, with refusing to regard the prevention of venereal disease as a matter purely of physical hygiene without reference to social and moral considerations. We therefore take the opportunity of printing the following letter which we have received from an Indian correspondent. Without containing anything new, this letter takes the *via media* which a medical man can adopt with a clear conscience towards his scientific knowledge and his social relations.

I have read with keen interest the correspondence in your journal on the prophylaxis of venereal diseases. The key to the situation lies in the realisation of the fact that while prophylaxis is good in its own way, it is capable of doing harm by removing the fear of consequences that has exercised a healthy check on illicit intercourse in some cases, though not in all cases. That consideration would adequately weigh against the rule of giving prophylactic advice if it were practicable to keep the advice away from those who seek it. But it is not so. Some may agree not to give such advice, others will disagree. And if the profession were to agree to observe the taboo, the quack would step in to supply the demand from the public. Since the advice is sure to be forthcoming, it would be better to let it come from the profession that knows its business than from the quack, and from the more scrupulous section of the profession than from the less scrupulous one. An attempted taboo would prove disastrous by driving the advice-seekers to less scrupulous and less competent advice-givers.

If we cannot withhold the advice, we should minimise the harm it is capable of doing by warning the patient that no prophylaxis besides abstinence is absolutely reliable or altogether safe, and informing him that illicit intercourse is injurious in a variety of ways, and that venereal diseases are not the only bitter fruits it bears. In that connexion a suitable moral lesson can be given which may have some salubrious effect in some cases if not in all cases.

In short, where advice is sought for, it should be given alongside with suitable moral advice. But it should not be carried home to those who seek it not. The great majority of such people would not care to follow the advice. On the other hand, immense harm would be done to the nation at large by openly countenancing and indirectly justifying indulgence, and thereby removing the sense of impropriety that has hitherto served as an effective healthy check in many cases, though not in all cases.

People who delight in considering themselves practical and scientific are prone to belittle and ignore the invisible moral and spiritual forces that rule the conduct of man and the destiny of nations, and to think too much of the visible means that achieve tangible results. But it is the invisible that counts in the long run, and material achievements eventually come to naught where they are not along the line of moral requirements. We should therefore take care not to preach and popularise prophylaxis at the risk of spoiling the moral sentiment and lowering the moral tone of the nation at large.

Princess-street, Bombay, April 28th, 1917. J. K. DAJI, L.M. & S.

NATIONAL BABY WEEK.

THE week in London closed under circumstances which amply justified the National Baby Week Council in having decided to give up street processions. On this day Queen Alexandra distributed at the Central Hall, Westminster, the prizes and certificates which had been awarded in the various competitions. As a result of Baby Week Adeline, Duchess of Bedford, announced at a meeting of mothers the establishment of a hostel for blind infants where treatment would be given and education arranged for them as they grew up. Dr. R. M. Wilson, who spoke at a conference on mothers' rights, emphasised the need for adequate medical attendance for mothers, as to which, he said, all idea of charity should be eliminated, the health of women and children being the proper care of the State. The new day nursery, which was opened by Lady Rhondda, at Edridge House, Fulham Park-road, with special grants from the Ministry of Munitions and the Board of Education, will accommodate 50 children and is regarded as a model of its kind. Mr. J. C. Jackson, the medical officer of health for Fulham, is chairman of the general committee. At a conference where the question of the supply of midwives was discussed, Dr. E. W. Hope, the medical officer for Liverpool, advocated the fixing of a standard of skill for the midwife, to whom some attraction should be held out in order to ensure the well-educated woman such remuneration as to free her from financial anxiety. He was not in favour of making the midwife a municipal officer. Through the midwives alone could the benefit of antenatal care be fully realised. Fewer doctors would be available for midwifery after the war.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The annual meeting of the Fellows of the College was held on July 5th, the President, Sir W. Watson Cheyne, being in the chair. The result of the election to the Council was as follows:—

	Votes.	Plumpers.		Votes.	Plumpers.
Vincent Warren Low	295	38	Henry Betham Robinson	188	15
James Sherren	228	32			
William Harrison Cripps	220	10	Harold Barr Grimsdale	147	28
Francis James Steward	197	53	Percy William Bassett-Smith ...	137	13

Colonel Charters Symonds, the Vice-President, declared that Mr. Warren Low and Mr. Cripps were re-elected members, and that Mr. Sherren was elected a member of the Council of the College. Seven Fellows voted in person, and 628 votes were received by post. Two voting papers were invalid and three arrived too late. Mr. H. J. Price and Mr. Willmott Evans acted as scrutineers.

Correspondence.

"Audi alteram partem."

THE LUMLEIAN LECTURES AND MEDICAL RESEARCH:

THE ASSESSMENT OF THE VALUE OF MURMURS.

To the Editor of THE LANCET.

SIR,—The principles which should underlie every clinical investigation are (1) to find out the mechanism by which each sign is produced, and (2) the effects which the cause of the sign has on the individual's future life. No doubt Sir Douglas Powell would say these principles are but truisms, but they are truisms of that kind which everyone reckons to recognise, but which no one puts in practice. The state of our knowledge of nearly every clinical sign reveals how systematically these principles have been ignored, and the attitude of the profession towards murmurs shows the need for applying them in practice. My reason for wishing Dr. Alexander Morison—or, for that matter, any other writer—to state precisely how a murmur should be assessed was to show that this could not be done. In this way I wished to emphasise the fact that a symptom so common, one which every doctor fancies is well understood, has never received that careful investigation which would enable us to appreciate its clinical significance and its practical application.

I could illustrate in numerous ways the need for a more thorough understanding of the significance of murmurs, but I will limit myself to one instance. Every doctor who engages in general practice will have from time to time put to him the question—whether a woman who has, or is supposed to have, some heart affection should be allowed to become pregnant. This is a momentous question, and every year concerns thousands of women. Now there is not in all medicine sufficient knowledge to enable the practitioner to answer that question in a satisfactory manner, and though it is constantly arising the practitoner can do nothing but give an opinion based mainly on guesswork and not on accurate knowledge. Why is this? Simply because he is taught by men who are ignorant of the subject. His obstetric teacher's knowledge of heart disease is too imperfect for him to be able to tell. His teacher of medicine never attends obstetric cases, so he can't know the effects of pregnancy on the heart. Why should not these teachers manfully acknowledge their ignorance? They have not had the opportunity to acquire the knowledge—why not frankly state this fact, and ask those who have the opportunity to undertake the inquiry?

The reason I speak thus dogmatically on the subject of heart disease and pregnancy is that this problem has been before me for many years. Shortly after entering general practice I attended a woman in labour with mitral stenosis, who died after great suffering, undelivered. I was so impressed by my helplessness that I read all the literature I could find on the subject. I was struck by the fact that no one seemed clear as to the source of danger, and no one had really studied the effects of pregnancy on the circulation of the healthy woman. I resolved to do this, and for years I made observations on women before pregnancy, during pregnancy and labour, and during the puerperium and afterwards. I accumulated a large number of observations, and when I came to analyse them I found myself unable to interpret them. I found variations in the size, the shape, and the position of the heart; modifications of the heart sounds and the appearance of murmurs; variations in the rate of the heart and frequent irregularities, and great distension of the jugular veins with marked pulsation. I searched the literature for enlightenment and failed to find it. I was therefore driven to a preliminary investigation—namely, to seek to know the mechanism by which these signs were produced and the effect the cause of these signs had upon the patient's future. This is what I have been doing the last 30 years. I have not solved the problem; I have only been able to indicate the lines on which this problem may be solved and to help to furnish some information in regard to the nature of the symptoms that may be of use to future investigators.

In my inquiry into the significance of these signs I was led to the conclusion that little advance could be made by the mere study of the murmurs, for I found that when heart failure ensued it was by impairment of the efficiency and by changes in the structure of the heart muscle. This led to a prolonged and systematic inquiry into the functions of the heart muscle and the signs of its inefficiency. Though for over 100 years it has been taught that the integrity of the heart's efficiency depended on the heart muscle, little or nothing had been done to study with precision and detail the signs by which this inefficiency was made manifest. The results obtained have in many ways shed a new light on the meaning of abnormal signs and on heart failure. Thus the relation of the condition of the heart muscle to any given murmur may be expressed in this way: (1) the presence of the murmur may indicate a valve defect which embarrasses a healthy muscle in its work, and we therefore have to look for the signs of embarrassment; (2) the presence of a murmur may indicate that the disease which damaged the valve may have also damaged the heart muscle and impaired its efficiency, so that we have not only to search for the signs of inefficiency, but also for signs of a damaged heart muscle.

I have failed to understand the mechanism by which the vast majority of systolic murmurs are produced. To call them curable mitral regurgitations, bruits of debility, exocardial and so forth, was simply to give them a name which conveyed a false impression, as I could get no evidence from studying them during life and examining the hearts after death to justify such terms. Failing in this, I turned to the question of the assessment in regard to the patient's future. By watching large numbers who led strenuous lives for many years I realised that the majority of systolic murmurs were without importance, and in searching for a method for differentiating those without significance from those that were of significance I inquired into the state of the heart muscle and came to the following conclusions.

If a systolic murmur was present and the response to effort was good, and there was no sign of any myocardial involvement, then the murmur was of no significance. If there was associated with the murmur evidence of functional inefficiency or of myocardial involvement, then the prognosis would depend on the extent and degree of the inefficiency and of the myocardial involvement, and this would be the object of further inquiry.

To illustrate the defects in our knowledge of the significance of murmurs, and to show how I have attempted the solution of the problem, I will comment on the letters of Sir Douglas Powell and Dr. E. H. Colbeck, as specific illustrations will carry more conviction than abstract propositions, however simple and convincing they may be.

Sir Douglas Powell gives an illustrative case which he quotes approvingly as giving all the details necessary for assessing the value of a diastolic aortic murmur. I quite agree with him it is a good example of the way in which the old school would view the matter, but in contrast to this I would show how partial and uninformative it is when it is desired to assess the value of the murmur. From the context I gather this case was one for life assurance. Now what would be the attitude of a medical examiner to such a case? Some would at once reject the man as a candidate, others might deduct a number of years from his prospect of life. On what grounds? Simply because experience tells that many people with aortic regurgitation die prematurely. Experience also tells that others with aortic regurgitation may live the normal span. As we do not know how to differentiate these, different examiners adopt different standards—but in no case is there such precise knowledge as to enable the examiner to assess the value of the murmur with any degree of accuracy.

Sir Douglas Powell's description leaves out certain data which are essential to the assessment. The first stage in heart failure is invariably shown by a limitation of the field of the heart's response to effort. This is made manifest to the patient by a sense of distress which is brought on by effort. There are a great number of sensations thus produced, each of them provoked by a different mechanism, and each of them differing in their significance, such as breathlessness, sense of exhaustion, tightness across the chest, pain, abnormal action of the heart. In estimating the efficiency of the heart muscle, not only the actual limitation of the field of response has to be recognised, but the sensations provoked by exhaustion, even if the field be not limited to any marked extent.

Now I know that everybody reckons to recognise that heart failure is manifested by a limited response to effort, yet the old school has never recognised its real significance. I maintain strongly as an experience forced upon me for the past 30 years that the recognition of the heart's efficiency is of the very first importance, of far greater importance than the recognition of any signs revealed by instrumental examination. The reason I say that the old school have never realised its importance is shown in two ways: Firstly, the questions asked by insurance companies never include the response to effort among their inquiries. Witness Sir Douglas Powell's description of his case—the response to effort is never referred to. Secondly, the profession has only an imperfect knowledge of the mechanism by which the sensations of distress in response to effort are brought about, and their relation to the heart's efficiency has never been fully appreciated.

I have already dwelt on the importance of changes in the heart muscle in estimating the value of a murmur yet save for an incidental reference to an increased size Sir Douglas Powell makes no reference to possible change, in the heart muscle. It is now a well-established fact that a disease like rheumatic fever frequently invades the heart muscle. Hitherto such invasion has been spoken of as silent—that is to say, it was supposed to give no sign of its presence. This, however, is not true, for the evidence is there, only we are too blind to see it. The changes in the size of the heart, in the rate of the heart, and in the rhythm of the heart afford evidence, but we are not yet sufficiently informed to value these changes. Take only one instance which shows definitely the invasion of the heart muscle. During rheumatic fever deposits of cells occur in the myocardium at different places which ultimately change into cicatrical lesions, damaging the heart muscle. If a deposit of these cells takes place on the bundle connecting the auricle with the ventricle, then the transmission of the stimulus from auricle to ventricle is interfered with, and we can now recognise the sign which this produces. Before the war my fellow-workers in the cardiac department of the London Hospital were making a study of all the phenomena in acute affections of the heart, and especially in rheumatic fever. They found in acute rheumatic cases a considerable number (about 10 per cent., if I remember rightly) in which they got evidence of a damaged bundle. Now it is a matter of chance whether the bundle is touched, so that the possibilities are that there are a great many cases where the deposits occur which do not fall on the bundle.

In reading Sir Douglas Powell's case I called to mind a similar case, a young man whom I attended for a mild attack of rheumatic fever and in whom I thought the heart had escaped. Some months after, when he seemed fit and well and was working hard, I detected a diastolic murmur. There was no enlargement of the heart. On taking a tracing of his jugular pulse I found evidence of an increased interval between the auricular and ventricular contractions, proof that the disease had invaded and damaged the muscle.

Perhaps this aspect of the matter will be better appreciated if I deal with Dr. Colbeck's statement that our knowledge of mitral stenosis has not advanced from the place where Sir W. Broadbent had left it. In my remarks I desire to convey no reflection on the past masters in clinical medicine. Broadbent was a great physician with a remarkably open mind, and I revere his memory from a personal point of view, for he was one of the very few physicians who appreciated what I was driving at, and for the kindly encouragement he gave me.

In the year 1880 I saw two young men, both had had an attack of rheumatic fever, and both had slightly enlarged hearts, and both had mitral systolic murmurs. Both were mechanics, and both were refused entrance into their trades union sick club because of their damaged hearts, though both had followed their laborious occupations without distress. I watched their cases for over 25 years. One pursued the even tenor of his way with no alteration in his cardiac condition. The other had a more chequered career. Seven or eight years later I discovered he had a short presystolic murmur. About 1890 I became aware that the murmur was separated by a slight interval from the first sound. In later years the separation became very distinct, the interval being so marked that it conformed to the usual description of a mid-diastolic murmur. About this time I was trying to unravel the meaning of the jugular pulse, and as he had a well-marked venous pulse I had no difficulty in setting a good record. There was something peculiar about the waves which I did not understand at the time, but later knowledge enabled me to recognise that there was an increased a.-c. interval—as I called the time between the waves in the jugular due to the contraction of the auricle and the carotid pulse. This I ultimately learned indicated an injury to the bundle connecting the auricle and the ventricle. The time of the mid-diastolic murmur corresponded to the time of the auricular wave in the jugular pulse, so that in this case it was demonstrated for the first time that this mid-diastolic murmur not only told us of the presence of mitral stenosis, but gave the information that the muscle wall of the ventricle was also invaded by the rheumatic disease, which had damaged the a.-v. bundle.

Somewhere about 1895 I detected a new murmur immediately following the second sound, so that he then showed a systolic, an early diastolic, and a mid-diastolic murmur. His heart's rate was always about 60, so that we had no difficulty in recognising these different murmurs. He continued his work till 1897, when he became seriously ill from extreme heart failure with dropsy. After a long period he made a slow recovery. During his illness his heart became very irregular, an irregularity which at the time I did not understand. I took careful records of his radial and jugular pulses, and in later years I recognised that the irregularity was due to the dropping out of ventricular beats—i.e., an increase in the heart block. The failure was evidently a myocardial one, for on his recovery the heart became quite regular and the murmurs present were unchanged. He resumed his work, and I detected no further change till March, 1904, when on one of his monthly calls on me I found his heart quite irregular with a disorderly rhythm. Up to this time records of his apex beat and of the jugular pulse had always shown "a" waves—that is, waves due to the left auricle in the apex-beat and to the right auricle in the jugular pulse. On this visit these had disappeared. The mid-diastolic murmur had also disappeared. A week later the heart was again quite regular, the "a" waves had returned to the jugular pulse and to the apex-beat tracings, and the mid-diastolic murmur had returned. This regular rhythm continued until November of that year, when the heart became again irregular, with the disappearance of all evidence of auricular activity—the condition of irregularity now known as auricular fibrillation, but which at that time I called paralysis of the auricle.

There were many other features revealed by this method of observation in this case, to which I need not here refer, as my purpose is to demonstrate certain facts connected with mitral stenosis which have never been clearly appreciated. Thus it is shown that the presystolic murmur appears some time after the causative attack of rheumatic fever; that as the stenosis is progressive its progress is made manifest by the changes in the murmur—first a short presystolic, then a longer presystolic, then a short diastolic which also increases in length. In observing a great many cases I find that these changes vary greatly in the time of their appearance after the causative illness—some, indeed, get a long presystolic and a long diastolic murmur within a few years. Here, then, we have a measure by which we can gauge the rate at which the stenosis takes place—a factor of the very greatest importance in giving a prognosis, especially in relation to heart disease and pregnancy.

In a great many people with mitral stenosis the real danger lies in the coincident changes in the heart muscle. I have notes of the case of a young man with moderate stenosis, but with a slight degree of heart-block, who died from muscle failure of the heart. On post-mortem examination extensive disease was found in the heart muscle. In another, a woman who suffered for years from a heart with a limited response, the mitral stenosis was very slight, but her death was finally precipitated by the onset of auricular fibrillation, and in her the left ventricle was extensively fibrosed.

In addition to these very important changes, it was in mitral stenosis cases that I got the clinical evidence that showed that curious cessation of auricular activity which we now call auricular fibrillation. I had long suspected this, and I set myself to watch individual cases of mitral stenosis, and in a woman whom I attended for 17 years, and who had in 1897 a serious attack of heart failure with marked irregular action, I was able to find all the evidences as in the case just described. Moreover, it was in these cases of mitral stenosis that I was able to recognise the extraordinary difference in the reaction of the heart to drugs of the digitalis group before and after the onset of the irregular action, and that peculiar susceptibility to the action of digitalis in auricular fibrillation which has revolutionised our conception as to the action of the drug.

I think if the reader duly comprehends the significance of these signs he is bound to admit that there has been a great advance in our knowledge in late years. I know that many physicians will probably "pooh-pooh" all these discoveries and tell us they get all the necessary facts from the old teachers, but the intelligent reader will have little difficulty in estimating the value of these protestations.

It will thus be seen that the assessment of a murmur cannot be of any value unless the efficiency of the muscle is taken into consideration. To appreciate the efficiency and the degree of efficiency it is necessary to detect the signs by which an inefficient and impaired muscle is made manifest. It is only in recent years that this matter has been studied, as it is only in recent years the methods by which it could be done have been developed.

Moreover, the manner by which heart failure is brought about and the action of cardiac remedies cannot be understood until we possess a fuller knowledge of the myocardial functions, and it is because we lack this knowledge that I made the statement that an accurate account of the action of digitalis on the human heart has never been published.

My reason for taking part in this correspondence is to show that if clinical medicine is to progress we must not rest content with the complacent notion that the limits of progress have been reached. We must recognise how imperfect is our knowledge of every clinical sign or symptom. Just as we do not know yet how to assess the value of many murmurs, so we are ignorant of the significance of many clinical signs.

Until this is recognised by the profession and a strenuous attempt made to understand the causation and significance of such signs, progress in clinical medicine will be greatly hampered. I am, Sir, yours faithfully,

Harley-street, W., June 29th, 1917. JAMES MACKENZIE.

THE DETECTION OF *ENTAMŒBA HISTOLYTICA* AND ITS CYSTS.

To the Editor of THE LANCET.

SIR,—In your issue of June 30th you publish an article, in the form of a report to the Medical Research Committee, on "The Detection of *Entamœba histolytica* and its Cysts," which calls for a little comment. The author does not refer to the paper published in your journal on April 14th by Dr. R. Donaldson, in which I had the honour of participating, but obviously there is much in common between the methods of both authors. Where, however, the latter author extends beyond the matters dealt with by Dr. Donaldson, he shows some lack of due judgment. Thus he gives instructions for the benefit of bacteriologists who may be tyros at the protozoal examination of fæces. Now perfectly inexperienced workers with the microscope may find these suggestions helpful, though less adequate than most text-books, but such persons must, as he points out, take their instruction at first hand, failing which they should not be in a position to make diagnoses at all. If, on the other hand, the remarks are addressed to those of riper experience in laboratory technique who have to turn their attention to this work, then I deplore the pessimism of the author, who considers that they need to be told to use good lenses and a mechanical stage!

Moreover, I demur at his advice on magnification. I find a ⅓" (8 mm.) objective far the best for routine examination. Used with a × 10 eyepiece this gives more than six times the area of field and 76 per cent. of the magnification of a ½" and × 6 eyepiece as recommended. The use of an orthoscopic eyepiece in place of the usual Huyghenian type greatly increases the field of view in either case. Everyone has his own preferences in these technical matters, and, like most microscopists, I would altogether mistrust the too detailed advice of others of whose *modus operandi* I knew little or nothing. Still, I am glad to notice that he does not mention that bad old idea of lowering the substage condenser to render details more easily visible. Although widely prevalent, it is quite inconsistent with optical theory or sound practice.

The portion of the paper dealing with staining the preparation treats, but without further profit, ground already covered in detail by Dr. Donaldson. Indeed, by the use of carbol fuchsin one great advantage of the earlier method is lost—namely, the diffused colour of the background, for the débris absorbs all the stain, leaving the field practically decolourised. If a saline emulsion be simply tinged with a little strong eosin, as good a differentiation of cysts (white on a red field) is obtained as with this carbol fuchsin and blue light. Neither method rids one of the confusion of other uncoloured objects, such as triple phosphate crystals; neither method aids the differentiation of the two types of cyst, and when doubt arises recourse must be had to iodine. In the previously quoted paper a certain mixture of iodine and eosin or rubin is advocated as the regular routine preparation for emulsification of fæces. Iodine *must* be used in doubtful cases, but two objections have been urged against its use in the first instance: firstly, that it agglutinates the fæces and so obscures the cysts. This is, I am sure, largely imaginary, since observation shows that not one specimen in 20 agglutinated with the strong iodine-rubin mixture, and, moreover, this solution will show up cysts even in unemulsified portions of fæces mounted in it.

The second argument is that it kills, and therefore obscures, free-living amœbæ and flagellates. In both cases, nevertheless, the sharply defined outline of the fixed organism at once attracts notice, and the absorption of stain actually enhances its visibility in many cases. Where acute symptoms are present final reference will always be to a saline preparation for the detection of living amœbæ; but I wish to emphasise that the primary use of a stained preparation does not exclude them. For military purposes the diagnosis of flagellates is of lesser importance, since almost all physicians agree in ignoring them.—I am, Sir, yours faithfully,

R. C. MCLEAN.

Pathological Laboratory, No. 1 War Hospital, Reading, July 4th.

ON SKIN-GRAFTING.

To the Editor of THE LANCET.

SIR,—The authors of the paper on the above subject in your issue of July 7th have apparently overlooked an article which appeared in THE LANCET of Nov. 25th, 1899, in which I described a method of skin-grafting in many respects resembling that which they describe and which aims at covering a raw surface with something firmer and less likely to contract than the ordinary Thiersch grafts.

I am, Sir, yours faithfully,

Upper Wimpole-street, W., July 7th. THOS. H. KELLOCK.

WAR HEART.

To the Editor of THE LANCET.

SIR,—The variety of war heart described by Colonel A. E. Garrod in your issue of June 30th is of great interest. Its occurrence in cases of malaria, dysentery, and trench fever, and the nature of the physical sign described, prompt me to refer to a similar condition found in another epidemic disease—viz., diphtheria. Colonel Garrod states that "the physical sign is an extension of the cardiac dullness towards the right, often to 1½ or 2 inches beyond the mid-sternal line. Only in extreme cases is there any conspicuous extension toward the left." This sign is also of frequent occurrence during the course of diphtheria, and in my experience is never absent in cases showing definite evidence of post-diphtheritic paralysis. The increase beyond the right margin of the sternum very often precedes the onset, and always accompanies the appearance of the well-known forms of diphtheritic palsy. If the latter be severe and extensive the dullness to the left is also increased and is of serious omen. In a paper read before our local medical society in 1908 I ventured to describe these right and left extensions as the "distant" and "near" danger signals respectively of the heart condition. These measurements of the deep cardiac dullness are of great prognostic value, and, as in the cases described by Colonel Garrod, give definite guidance, not only as to the need of rest, but also as to how long it should be continued. Why the right side of the heart dilates earlier than the left in these toxic states is an interesting question, and one to which I do not remember having seen a sufficient answer.

As one who had the privilege of working under the late Dr. D. B. Lees, I am glad to see the reference to his teaching and methods. He emphasised the importance of light finger percussion, of frequent (daily) mapping-out and measurement, and the careful keeping and comparison of records in the study of dilatation of the heart chambers in conditions of disease.—I am, Sir, yours faithfully,

Cardiff, July 2nd, 1917. ALFRED HOWELL, M.D. Lond.

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue :—

Killed.

Capt. J. E. Brydon, R.A.M.C., attached Yorkshire Regiment, qualified at Edinburgh in 1908, and had held appointments at the Bristol Children's Hospital and at the Darlington Hospital. Before joining the R.A.M.C. in the early part of 1915 he was in practice at Chagford, Devon.

Major W. G. Porter, M.B., B.Sc., F.R.C.S. Edin., D.S.O., who was acting as a combatant officer, qualified at Edinburgh in 1906, in which city he was a well-known ear, nose, and throat surgeon, and held several hospital appointments. When war broke out he held captain's rank in the Royal Field Artillery Territorial Force, and in the autumn of 1915 he went on active service in France. The award of the D.S.O. was gazetted early in June this year.

Accidentally Drowned.

Lieut. F. Whincup, R.A.M.C., was a student at St. Bartholomew's Hospital, London, and qualified in 1897. He had held appointments at the Shropshire and Mid Wales Eye, Ear, and Throat Hospital, at the Stroud Hospital, and at the Devon and East Cornwall Hospital, Plymouth. Prior to joining the R.A.M.C. he was in practice at Shrewsbury where he was physician to the Royal Salop Infirmary, and medical officer to the Post Office and Board of Education. He was accidentally drowned in France.

Died.

Capt. A. L. M. Churchill, R.A.M.C., attached London Regiment, was a student at Westminster Hospital, and qualified in 1895. After holding appointments at Wonford Hospital and at the County Asylum, Lancaster, he practised at Mevagissey, Cornwall, and joined the R.A.M.C. towards the close of the year 1914.

Lieut. A. Atkinson, R.A.M.C., was educated at Leeds, and qualified in 1884. He held the appointment of house surgeon at Leeds General Infirmary, and was in practice at Harringay, London, before joining the R.A.M.C.

Wounded.

Capt. L. R. Meech, M.C., R.A.M.C.
Capt. R. L. Kenihan, Australian A.M.C.
Major H. D'A. Beumberg, R.A.M.C., attd. Liverpool Regt.
Capt. R. Johnson, R.A.M.C.
Capt. F. A. Hampton, R.A.M.C., attached Royal Scots.
Capt. H. Young, R.A.M.C.
Lieut. J. Berry, New Zealand M.C.
Capt. E. A. Walker, R.A.M.C.
Major L. W. Bond, Australian A.M.C.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of medical men are reported :—

Second Lieut. C. W. Goodall, South Staffordshire Regiment, killed in action, second son of Dr. E. W. Goodall, of the North-Western Hospital, Hampstead, London.

Second Lieut. C. C. Lucas, Northants Regiment, killed in action, youngest son of the late Dr. R. C. Lucas, of West Lavant, near Midhurst, Sussex, and of Wimpole-street, London.

Capt. B. R. Poole, Canadian Army Veterinary Corps, killed by a shell whilst on duty with the Railway Corps, youngest son of Surgeon-Major Poole, Bengal Medical Service.

Second Lieut. J. E. Power-Clutterbuck, Royal Field Artillery, attached Royal Flying Corps, killed in action, only son of the late Surgeon-Major E. R. Power, A.M.S.

Second Lieut. J. MacH. Crombie, Royal West Kent Regiment, died of wounds received in action, youngest son of Dr. J. Crombie, of Sidcup, Kent.

MENTIONED IN DESPATCHES.

In a despatch received from General Sir Archibald Murray describing the operations undertaken by the Egyptian Expeditionary Force from October, 1916, to February, 1917, the names of the following medical officers are mentioned for gallant or distinguished conduct in the field or for other valuable services :—

Staff.—Maj. H. V. Bagshawe, R.A.M.C.; Maj. R. H. Bridges, R.A.M.C.; Capt. G. Dalziel, R.A.M.C., Spec. Res.; Lt.-Col. E. J. R. Evatt, R.A.M.C.; Capt. A. S. M. Macgregor, R.A.M.C. (T.F.); Col. C. J. MacDonald, A.M.S.; Col. (temp. Surg.-Gen.) J. Maher, A.M.S.; Lt.-Col. (temp. Col.) O. L. Robinson, R.A.M.C.; Col. M. J. Sexton, A.M.S.; Maj. G. C. Taylor, R.A.M.C.

R.A.M.C.—Capt. (temp. Maj.) J. Aitken; Capt. J. A. H. Aitken; Capt. C. H. Allen; Temp. Capt. P. H. Bahr; Capt. L. B. Baird; Capt. F. S. Bedale; Temp. Lt. F. J. H. Begg; Capt. M. Brennan; Capt. A. E. Bullock; Capt. (temp. Maj.) O. C. P. Cooke; Temp. Lt. F. W. Davidson; Capt. J. Davidson; Capt. H. R. Dive; Maj. (temp. Lt.-Col.) M. Dunning; Maj. (temp. Lt.-Col.) J. Evans; Temp. Maj. A. R. Ferguson; Capt. W. T. Gardiner; Capt. (temp. Maj.) W. W. Greer; Capt. A. A. Gunn; Temp. Lt. A. E. Harrisson; Maj. (temp. Lt.-Col.) R. B. Hole; Lt.-Col. A. Hosie (ret.); Capt. J. Inglis; Maj. C. Kerr; Temp. Capt. H. V. Leigh; Temp. Capt. F. J. McGlade; Temp. Capt. R. B. F. McKail; Capt. W. F. Mackenzie; Capt. A. A. McWhan; Lt.-Col. W. R. Matthews; Capt. W. H. Milligan; Maj. (temp. Lt.-Col.) H. T. Samuel; Lt.-Col. G. Scott (ret.); Capt. C. F. Searle; Capt. A. F. B. Shaw; Temp. Capt. H. P. Sheppard; Temp. Capt. H. E. S. Stiven; Capt. O. Teichmann; Lt.-Col. H. W. Thomson; Capt. W. T. Torrance; Capt. W. W. Treves; Maj. (temp. Lt.-Col.) G. A. Troup; Capt. P. S. Vickerman; Capt. R. G. Walker; Capt. A. P. Watson; Capt. T. Young.

Australian A.M.C.—Capt. W. Evans; Lt.-Col. W. A. Fraser; Lt.-Col. R. Macdonald.

New Zealand M.C.—Capt. (temp. Maj.) C. E. Hercus; Lt.-Col. C. T. H. Newton; Capt. R. L. Withers.

I.M.S.—Maj. R. W. Knox; Maj. T. C. Rutherfoord; Capt. R. B. S. Sewell; Lt.-Col. A. J. Willcocks.

Order of St. John of Jerusalem.—Dr. A. Granville, C.M.G.

Civil Departments, &c.—Dr. J. Warnock.

THE CANADIAN HOSPITAL, ORPINGTON.—On July 5th Mr. Walter Long, Secretary of State for the Colonies, opened an extension of the Ontario Military Hospital at Orpington. Like the original institution, the extension is the gift of the province from which the hospital takes its name, but it is open to wounded men of all branches of the Army of the Empire. When started in February, 1916, the hospital had an accommodation for 1040 beds, but this has now been doubled. A statement by Lieutenant-Colonel Macpherson, the Commandant, showed that during the past 12 months 8129 men had been treated, of whom more than half were inhabitants of the British Isles, 2943 of Canada, and 576 of Australia.

THE DEPLETION OF HOSPITAL STAFFS.—Mr. Cosmo Bonsor, the president of Guy's Hospital, has on behalf of the governors of the hospital drawn the attention of Lord Rhondda, then President of the Local Government Board, to the difficulties in which hospitals with medical schools were likely to be placed unless steps were taken to prevent the further depletion of their staffs; he pointed out that the closure of important departments was imminent and would be very serious in consequence. Lord Rhondda replied, hoping that the provisions of the Military Service Act, 1916, would prevent any undue hardship to hospitals, and considered that the Committee of Reference of the English Royal Colleges, acting in conjunction with the Central Medical War Committee, would be able to meet the needs of the Army without unduly restricting hospital service. No member of a hospital staff is taken until his case has been considered by the Committee of Reference.

KING GEORGE'S FUND FOR SAILORS.—This Fund, which has for its president Prince Albert and for its chairman the Duke of Connaught, has been established on the same lines as King Edward's Hospital Fund for London, in the interests of seamen of the Royal Navy and mercantile marine and their families. All institutions, including hospitals, which are supported wholly or in part by public contributions for the benefit of seamen will receive aid from the Fund. From July 22nd to 28th, "Navy Week," the leaders of the stage and the cinema industry have arranged a special programme in aid of the Fund, the offices of which are at Trinity House, Tower Hill, E.C.

OBITUARY OF THE WAR.

LEWIS EMERSON CLARK, M.D. McGILL,

CAPTAIN, CANADIAN ARMY MEDICAL CORPS.

Lewis Emerson Clark, who was killed in action on the Western front on the morning of June 7th, at the age of 29 years, was son of Mrs. C. F. Clark, of Vancouver, and was born at Ellsworth, Kansas, U.S. His family going to Canada, he entered McGill University, graduating in medicine in 1913, and spending the following years as interne at the Montreal General Hospital. He was then attached for short periods to the Women's Hospital and to the Royal Victoria Hospital, Montreal, and for the major part of a year prior to joining the C.A.M.C. was engaged as ship's surgeon. Arriving in England in June, 1916, he was in the following month

transferred to France to the 2nd Canadian General Hospital, and after service at this and the 2nd Canadian Stationary Hospital, was early this year made R.M.O. of a battalion, where his cheery disposition and capacity for dealing with men made him very popular. Captain Clark was unmarried.

OWEN HAIRSINE, M.R.C.S. ENG.,

MILITARY CROSS,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain O. Hairsine, who was killed in action on June 7th, at the age of 26 years, was youngest son of Herbert S. Hairsine, of West Hampstead. Educated at Tonbridge and the Middlesex Hospital, he qualified in 1914, and took a commission in the R.A.M.C., Special Reserve. He was in the retreat from Mons, being mentioned in despatches and receiving the Military Cross a year later. He had more than one narrow escape in the early days of the war when the dressing stations in which he was working were under shell fire, and his death, which occurred while he was bringing in a wounded man from the open, was instantaneous. His colonel wrote of him as a man of great value to the ambulance. Captain Hairsine was married a year ago.

FREDERICK WILLIAM HENRY DAVIE HARRIS, M.R.C.S. ENG.,

LIEUTENANT-COLONEL, ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonel F. W. H. D. Harris, whose sudden death occurred last month, was elder son of the late Commander W. H. Harris, R.N., and was educated at the Royal Naval School, New Cross. He completed his medical studies at University College, London, in 1880, and entered the R.A.M.C. five years later. He served for 20 years, dividing his time between India and Egypt. After the Boer War he received the King's and Queen's medals with clasps, being present at Stormberg and other engagements. For three years he was adjutant of the R.A.M.C. at Aldershot. On retiring in 1905 he was medical officer to the depôt at Bodmin, resigning that appointment to take up the secretaryship of the R.A.M.C. benevolent funds in London. At the outbreak of the present war he became the secretary of the Auxiliary R.A.M.C. Funds, which he assisted in establishing. He was also medical officer to the Army Clothing Department in London, and honorary treasurer to the R.A.M.C. Comforts Fund. He discharged his various duties almost up to the time of his death, his illness lasting a bare fortnight. A good comrade, a sportsman, and a sound man of business, his death will be regretted by numerous friends in all branches of the Army.

Colonel Harris leaves a widow, daughter of the late Major J. H. King, Royal Scots Greys, and two sons, both of whom are in the Army.

HENRY HAROLD ROBINSON, D.S.O., M.R.C.S. ENG.,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain H. H. Robinson, who was drowned when the transport *Transylvania* was torpedoed in the Mediterranean on May 4th, at the age of 40, was the younger son of H. Robinson, of Manchester. He was educated at Owens College, Manchester, qualifying in 1899, when he occupied resident appointments at Burton-on-Trent and Southport Infirmaries. He then settled in practice in Birkenhead, where he became honorary medical officer to the Birkenhead Children's Hospital, and an active member, sometime president, of the Birkenhead Medical Society. Although opposed to the principles of the National Health Insurance Act, when the Act became law he served on the panel and worked to the best of his ability to ensure its success. A fellow practitioner writes of Captain Robinson: "His loss means much to many. His patients lose his ever-ready and skilful aid, his colleagues an honourable practitioner of attractive brightness, his fellow townsmen one continually ready to do the best required of him. Brave, unselfish, and with a high sense of duty, he was beloved by his men in the Army, and held in high regard by his superior officers." Captain Robinson married in 1905 the daughter of the late J. C. Wann, J.P., and leaves a widow and two children. He was a contributor to the columns of THE LANCET.

DOUGLAS REID KING, M.B., CH.B. GLASG.,

MILITARY CROSS,

CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain D. R. King, who was killed in action on June 7th, was the fourth son of the late John King, of Helensburgh and Cove, and was educated at Larchfield School. He studied medicine at Glasgow University, where he was a gold medallist, graduating M.B. and Ch.B. in 1914. Having entered the Special Reserve of the R.A.M.C. as lieutenant, he joined for duty on Sept. 15th, 1914. He was mentioned in despatches in 1915 and received the Military Cross on June 3rd, 1917, four days before his death.

ANDREW VICTOR HONMAN, M.B., CH.B. MELB.,

MAJOR, AUSTRALIAN ARMY MEDICAL CORPS.

Major A. V. Honman, who was killed in France on May 20th, at the age of 26 years, was the son of Dr. Andrew Honman, one of the leading medical practitioners at Melbourne. He had a distinguished career at Melbourne University, graduating with honours in December, 1912. Volunteering for service on the outbreak of war, he left with the 2nd Australian Field Ambulance in October, 1914. With this unit he served at Gallipoli, and for good work at Suvla in August, 1915, was mentioned in despatches. At the time of his death he had been serving in France for about 12 months. Major Honman was by nature quiet and unassuming; he was much respected by his men for coolness and steadiness under fire and in difficult places. His loss will be keenly felt by many University and Service friends.

Obituary.

WILLIAM GEORGE TOTTENHAM POSNETT, F.R.C.S. IREL.

Mr. W. G. T. Posnett, whose death took place on June 17th at the early age of 46, had served both as civil and military surgeon in a variety of capacities. At Bloemfontein during the Boer War he was one of the operators at No. 8 General Hospital, performing there over 600 major operations. During the previous Zulu campaign he held a commission as surgeon-captain. Offering his services in August, 1915, to the French Red Cross, he served at Yvetôt for more than two months and received the warm recognition of the French Medical Service. In July, 1916, he was appointed by the War Office to examine recruits. He was then in the best of health, but often spoke of the bad ventilation and insanitary state of the recruiting stations. About Christmas-time he began to have fluctuations of temperature which he attributed to malaria. Gradually loss of weight, cough, and hoarseness necessitated treatment. A consultation on March 13th of two eminent specialists resulted in a diagnosis of tuberculous laryngitis and both lungs also affected.

Dr. Arthur Ransome, his father-in-law, who has sent us the details of Mr. Posnett's illness, writes that the extreme virulence of the infection was shown by the rapidity of its progress, and that he has drawn the attention of the medical officers of the London County Council and the Local Government Board to the risks their officers are running under the conditions prevailing at the recruiting stations.

THE SERVICES.

ROYAL NAVAL MEDICAL SERVICE.

W. P. Tew, C. de C. W. Langdon, W. L. Denny, J. J. Keatley to be temporary Surgeons.

ROYAL NAVAL VOLUNTEER RESERVE.

Surg. A. J. Gilbertson to be Staff Surgeon.
P. G. Fildes to be temporary Honorary Staff Surgeon.

ARMY MEDICAL SERVICE.

Col. O. R. A. Julian, C.B., C.M.G., to be temporary Surgeon-General.

ROYAL ARMY MEDICAL CORPS.

Temp. Col. W. Hunter (Capt., R.A.M.C., T.F.) reverts to the rank of temporary Lieutenant-Colonel on re-posting.

Lieut.-Col. (Temp. Col.) O. L. Robinson, C.M.G., relinquishes his temporary rank on re-posting.

To be temporary Colonels whilst employed as Assistant Directors of Medical Services of a Division: Lieut.-Col. A. G. Thompson, Bt. Col. Thomas W. Gibbard.

Majors relinquishing the acting rank of Lieutenant-Colonel on re-posting: A. M. Rose, D. P. Watson, R. C. Wilmot.

Temp. Major W. Bapty, Canadian A.M.C., to be temporary Major.

Capt. F. C. Davidson to be acting Lieutenant-Colonel whilst in command of a Field Ambulance.

Temp. Capt. R. Wilson to be temporary Major whilst in command of Troops on a Hospital Ship.

Temp. Capt. W. L. Maclean, Canadian A.M.C., to be temporary Major.

The undermentioned are granted temporary honorary rank whilst employed with No. 22 General Hospital:—As Major: K. Emerson. As Captains: F. Brigham, F. J. Caldwell, P. Gustafson, D. E. Ford. As Lieutenants: C. N. Lewis, W. S. Ramsey, L. M. V. Stone, D. J. Knowlton, G. W. Cottis.

Temporary Lieutenants to be temporary Captains: H. F. Ferguson, D. Gaston, H. M. Gray, K. Elmes, J. J. Shannon, A. Morton, T. S. Paterson, J. L. Torley, D. McLaren, W. W. Morrison, M. M. Frew, N. H. Smith, N. M. Cummins, G. Fehrsen, G. T. Garraway, R. H. Fleming, W. N. Montgomery, J. S. Kinross, C. E. Wise, F. W. Clark, J. Jaffé, J. R. P. McLaren, L. M. Davis, O. C. M. Davis, J. Cross, J. Glaister, Z. A. Green, H. R. Tighe, T. W. Bailey, J. G. Forbes, R. O. Lee, D. H. A. Galbraith, S. F. Harris, C. R. Reckitt, J. W. Thomas, W. S. King, T. O. Robson, A. E. Burroughs, J. A. Giles, H. S. McSorley, G. B. Archer, B. W. Mosher, L. W. Jones, H. J. C. Gibson, J. A. Edmond, E. J. Mannix, E. Lanzon, J. D. W. Beavis, E. Kennington, R. B. Bryan, J. F. Penson, G. O. Hutchinson, A. W. McGregor, C. Harris, H. C. A. Haynes, W. G. Johnson, B. C. Haller, S. N. Babington, A. Finlay, H. A. Colwell, J. E. McMillan, L. Blake, H. J. Davidson, W. H. Harvey, L. ap I. Davies, H. L. Shelton, V. L. Connolly, W. Steadman, E. V. Beaumont, H. F. Wilson, A. E. Gravelle, A. J. Bennee, W. P. H. Lightbody, J. C. Macaulay, J. A. Paterson, H. D. Gasteen, E. S. Molyneux, F. J. McCarthy, G. E. Chissell, J. T. Lloyd, S. Rodin, E. L. Steele, C. S. Tennant, I. Vandandaigue, F. R. Fraser, T. G. Elsworth, G. B. Bartlett, G. H. Culverwell, C. S. Thomson.

Officers relinquishing their commissions: Temp. Capts. H. A. G. Hadden (on account of ill-health, and is granted the honorary rank of Captain), A. E. Moore, S. H. M. Neave; Temp. Lieuts. W. A. Murray, E. E. Bryans, R. D. L. Greene, A. Campbell, P. L. Blaber, J. A. Hope, R. H. C. O. Wisdom, A. A. Halliday, J. Devine, S. F. Floyd, J. Crean, A. G. L. Smith, J. F. Walsh, A. P. Gibbons, J. B. McMorland, G. B. Ferguson.

SPECIAL RESERVE OF OFFICERS.

To be Lieutenants: L. J. Vincent, from University of London Contingent, O.T.C.; M. F. Murphy, from Royal College of Surgeons in Ireland Contingent, O.T.C.; J. Wilson, from Queen's University, Belfast Contingent, O.T.C.

Capt. S. J. Henderson relinquishes his commission on account of ill-health.

TERRITORIAL FORCE.

Major E. H. Cox to be acting Lieutenant-Colonel whilst commanding a Field Ambulance.

Major R. J. W. Oswald to be Lieutenant-Colonel on the permanent personnel.

Capt. (acting Lieut.-Col.) W. P. Ferguson relinquishes his acting rank on ceasing to command a Field Ambulance.

Capt. G. S. Williamson to be acting Lieutenant-Colonel whilst commanding a Field Ambulance.

Captains seconded for duty with a General Hospital: J. A. Innes, A. E. Campbell, F. G. Stuart, W. Alexander, A. A. McKenzie, A. J. Campbell, N. Hodgson, D. Cameron, J. Chalmers, E. McM. Dunlop, A. C. Hepburn, D. Campbell, J. W. Anderson.

Capt. A. W. Nuthall is seconded whilst holding a temporary commission in the R.A.M.C.

Lieutenants (temporary Captains) to be Captains: E. B. Kitching, J. W. Craven.

Lieut. H. Evers to be Captain.

R. T. Pearl to be Lieutenant.

Attached to Units other than Medical Units.—Major H. W. Williams to be acting Lieutenant-Colonel whilst commanding a Casualty Clearing Station; Capt. W. T. Rowe, from Army Medical Service, to be Major, and is seconded for duty with a General Hospital.

URBAN VITAL STATISTICS.

(Week ended July 7th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was 11·2, against 12·4 and 11·7 per 1000 in the two preceding weeks. In London, with a population exceeding 4,000,000 persons, the death-rate was 10·4, or 0·9 per 1000 below that recorded in the previous week; among the remaining towns the rates ranged from 3·3 in Ilford, 4·2 in Hastings, and 4·7 in Gillingham to 19·1 in South Shields, 19·8 in Wakefield, and 22·0 in Carlisle. The principal epidemic diseases caused 285 deaths, which corresponded to an annual rate of 0·8 per 1000, and included 114 from measles, 60 from infantile diarrhœa, 44 from whooping-cough, 32 from diphtheria, 11 from enteric fever, and 4 from scarlet fever. The deaths from measles showed a further decline compared with the numbers registered in the five preceding weeks, and caused the highest annual rates of 1·7 in St. Helens, 1·8 in Stockton-on-Tees, 2·3 in Walsall, 2·6 in Darlington, and 3·2 in Middlesbrough. The 642 cases of scarlet fever and the 1061 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 36 and 10 above the numbers remaining at the end of the previous week. Of the 3629 deaths from all causes in the 96 towns 128 resulted from violence. The causes of 28 deaths were uncertified, and included 6 in Birmingham.

Scotch Towns.—In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual death-rate was 13·0, against rates steadily declining from 17·0 to 13·6 per 1000 in the seven preceding weeks. The 292 deaths in Glasgow corresponded to an annual rate of 13·6 per 1000, and included 17 from whooping-cough, 16 from measles, and 4 from infantile diarrhœa. The 72 deaths in Edinburgh were equal to a rate of 11·3 per 1000, and included 2 from whooping-cough and 1 each from diphtheria and infantile diarrhœa.

Irish Towns.—The 116 deaths in Dublin corresponded to an annual rate of 15·2, or 3·2 per 1000 above that recorded in the previous week, and included 3 from whooping-cough, 2 from infantile diarrhœa, and 1 each from enteric fever and measles. The 92 deaths in Belfast were equal to a rate of 12·2 per 1000, and included 2 from measles and 1 each from whooping-cough, diphtheria, and infantile diarrhœa.

THE Minister of Pensions has appointed Colonel Sir John Collie, R.A.M.C., to be Director of Neurasthenic Institutions.

DUBLIN UNIVERSITY MEDICAL SCHOOL AND THE WAR.—Speaking at a meeting held in aid of the Dublin University Voluntary Aid Hospital last week, Professor A. F. Dixon, dean of the medical school, quoted interesting figures as to the part played by past and present students of the School of Physic in the war. About 900 past or present students were employed in one or other of the services of the Crown. Since June, 1913, 199 men of Irish or British birth had qualified from Dublin University, and of these 196 had volunteered for service. In addition, 175 medical students had volunteered without waiting to qualify. Of the women graduates 7 were serving with the Royal Army Medical Corps. The records of honours showed that 135 past students of the School of Physic had been mentioned in despatches, 47 had been awarded the Military Cross, 2 had received bars to the Military Cross, 31 had received the Distinguished Service Order, 11 had received the honour of C.M.G., 10 of C.B., 1 of K.C.B., 1 of C.I.E., and 5 had received foreign decorations. The record is very remarkable and is in keeping with the great traditions of Trinity College.

Medical News.

SOCIETY OF APOTHECARIES OF LONDON.—At examinations held recently the following candidates were successful in the subjects indicated:—

PRIMARY EXAMINATION, PART II.

Physiology.—R. G. Addenbrooke, Birmingham; D. R. Ainsworth, Manchester; C. C. Becker, Guy's Hospital; B. C. Betts, Manchester; S. Blackman, London Hospital; J. P. Brown, Liverpool; C. E. G. Busbridge, University College Hospital; M. D. Cadman, St. Thomas's Hospital; G. W. Cheater, King's College; L. C. F. Chevens, St. Thomas's Hospital; G. L. Clements, Birmingham; A. R. Crane, London Hospital; D. A. Dias, Liverpool; A. G. Duncan, London Hospital; A. H. Hall, Birmingham; R. R. Halsall and G. R. D. Hankinson, Manchester; M. C. Hartley, London Hospital; A. Hesselberg, Liverpool; D. Hunter, London Hospital; E. T. Lloyd, Guy's Hospital; F. J. M. Larkins, Liverpool; G. P. Lindsay, Guy's Hospital; F. Lockwood, Liverpool; H. A. Lomax, Manchester; I. B. McCann, Guy's Hospital; M. S. Mahmud and G. P. Monk, Liverpool; C. F. Newman, Birmingham; E. G. Parkinson, Manchester; H. A. Potter, Middlesex Hospital; P. L. Richardson, Guy's Hospital; L. Samuels, Manchester; W. H. Summerskill, Guy's Hospital; M. Tree, London Hospital; W. H. Turner, Guy's Hospital; A. Williams, Bristol; D. C. Williams, London Hospital; E. F. Wilson, Guy's Hospital; G. A. P. Wright, Bristol; S. Wright, Middlesex Hospital; and J. E. Zeitlin, London Hospital.

Anatomy.—D. R. Ainsworth and B. C. Betts, Manchester; S. Blackman, London Hospital; H. Brown and J. P. Brown, Liverpool; C. E. G. Busbridge, University College Hospital; M. D. Cadman, St. Thomas's Hospital; G. W. Cheater, King's College; L. C. F. Chevens, St. Thomas's Hospital; G. L. Clements, Birmingham; D. A. Dias, Liverpool; A. G. Duncan, London Hospital; A. H. Hall, Birmingham; G. R. D. Hankinson, Manchester; M. C. Hartley, London Hospital; A. Hesselberg, Liverpool; D. Hunter, London Hospital; W. T. Johnson, Birmingham and Middlesex Hospital; M. A. R. Khalifa and E. T. Lloyd, Guy's Hospital; F. J. M. Larkins, Liverpool; G. P. Lindsay, Guy's Hospital; F. Lockwood, Liverpool; H. A. Lomax, Manchester; I. B. McCann, Guy's Hospital; G. P. Monk, Liverpool; H. A. Nathan, King's College; H. A. Potter, Middlesex Hospital; J. G. Reed, St. Thomas's Hospital; L. Samuels, Manchester; W. H. Summerskill, Guy's Hospital; M. Tree, London Hospital; A. A. Weinger, King's College; D. C. Williams, London Hospital; E. F. Wilson, Guy's Hospital; S. Wright, Middlesex Hospital; and C. F. Young and J. E. Zeitlin, London Hospital.

UNIVERSITY OF ABERDEEN: INSTALLATION OF THE CHANCELLOR AND SUMMER GRADUATION.—On Friday, July 6th, the installation of the Duke of Richmond and Gordon, as Chancellor of the University of Aberdeen was held in Marischal College, the summer graduation being held at the same time. The proceedings were characterised with greater quietness on part of the students than is usually the case, and the ceremony was simple as befitted the times. The hall, however, was well filled, and there was a full attendance of the University staff. The Lord Provost and magistrates were also present. After taking the oath of fealty to the University, the new Chancellor took his place in the chair, and as the graduates in arts, science, and medicine were presented he capped and shook hands with each. The inaugural address was afterwards delivered. The following degrees in medicine were conferred:—

DEGREE OF DOCTOR OF MEDICINE (M.D.).

James Matthews Duncan and Robert Richards.

DEGREES OF BACHELOR OF MEDICINE (M.B.) AND BACHELOR OF SURGERY (CH.B.).

John Wilson Bowman, Frederick William Carter (distinction), Charles Alexander Harvey, Benjamin Wignall Jones, Duncan William MacKay, Acbyuta Menon Mannatazhat, Arthur Young Milne, George Fowler Mitchell, Andrew George Reekie, Charles Reid (second-class honours), James Maxwell Savege, James Innes Watson, Charles Mayfield Wood, and William Lyall Yell (distinction).

The John Murray medal and scholarship, given to the most distinguished graduate (M.B.) of 1917, was awarded to George Reid McRobert.

UNIVERSITY OF GLASGOW.—At examinations held recently the following candidates passed in the subjects indicated:—

DEGREES OF M.B. AND CH.B.

(*M*) *Materia Medica and Therapeutics*, (*P*) *Pathology*, (*M.J.*) *Medical Jurisprudence and Public Health.*—John Smith Aitken, M.; Carl Otto Anderson, P.; John David Arthur, P.; Alexander Kidd Begg, M.; Alexander Shanks Bisset, P.; William George Burns, P.; James Caddies, M., P.; William James Simon Cameron, P.; Thomas Watson Carstairs, P.; John Gilchrist Coltart, M., P.; Harold Livingstone Coulthard, P.; Andrew Murdoch Davidson, P.; John Donald, P. (distinction); William Edgar, P.; Matthew Forsyth Gibson, M., P.; George Osmond Grant, P.; John Hewitt, M., P.; Humphrey Josh Hollis, P.; Robert Gold Howat, M., P.; John Alexander Jenkins, M.; Samuel Himow Wolf Kamerasse, M., P.; John Kirk, P., M.J.; Archibald Campbell Lindsay, M., P.; Robert M'Courtney, P., M.J.; Donald Maclean, P.; Findlay Kerr Macmillan, P.; Allan Watt M'Rorie, P.; Robert Mair, M., P.; John M'Kean Maxton, M., P.; John Spence Meighan, P.; Modiri Silas Molema, M., P.; James Bennie Morrison, M., P.; Bryce Frood Niblock, P.; John Nicol, P. (distinction); John William Peden, P.; John Pollock, M., P.; James Morrison Ritchie, P.; William Scotland, M.; Herbert Harold Spencer, P.; Noel Eustace Stone, M., P.; John Brunton Sweet, M.; John Leonard Turpie, M.; James Alexander Walls, P.; Robert Kennedy Watt, M., P.; Robert Young, P.; and Stephen Young, M.

Women:—Helen Frances Allinson, P.; Susan Struthers Bryce, M., P.; Elizabeth Pace Cameron, M., P. (distinction); Mary Turner Liddell Clark, M., P. (distinction); Emily Loudon Clow, M., P.; Veronica Catherine Jessie Davies, M., P.; Edith Dennistoun Dobbie, P.; Charlotte Ann Douglas, M., P.; Margaret Hogg Grant, P.; Helen Hogg, M., P.; Alison Mary Hunter, P.; Alice M'Elwee, M., P.; Alice M'Glashan, M., P.; Annie Isabel Christian Maclardy, M.; Margaret Elizabeth MacLaren, M., P.; Mabel Mary Maclean, M., P.; Caroline Jane Maclennan, M., P.; Agnes Hislop Macwhirter, M., P.; Georgina Murdoch, M., P.; Kathleen Nicol, P.; Margaret Mitchell Paterson, M., P.; Louisa Evelyn Pigeon, M., P.; Helen Lennie Ralston, M., P.; Margaret Nelson Robertson, P.; Elaine Bessie Stuart Stocquart, M., P.; Muriel Amy Stowe, M., P.; Jean Banks Thomson, M., P.; Marion Thomson, M., P.; and Helen Barr Wilson, M., P.

New Medical Ordinance.—The following passed in Medical Jurisprudence and Public Health of the Fourth Professional Examination (in addition to the candidates under the Old Regulations named in the foregoing list):—

William Barras, Malcolm Chalmers, Kenneth John Alexander Gillanders, Edward Porteous Irving, Arthur Kennedy, Vida Johnston Perry, Ian Menteith Robertson, and John Joseph Robertson.

Lieutenant-Colonel G. Sims Woodhead, R.A.M.C.T., will give an address on Farm Colonies for the Tuberculous at the annual meeting of the National Association for the Prevention of Consumption to be held in the hall, 20, Hanover-square, London, W. 1, on Monday next, July 16th, at 5 P.M.

IN the winter session of 1916–17 there were 794 women studying medicine at the Prussian Universities, as against 705 in the corresponding session a year ago.

DONATIONS AND BEQUESTS.—By will the late Mr. Charles William Ware, of Ripon, Yorks, left, subject to a life interest, £4000 to the British Home and Hospital for Incurables, Streatham. The residue of the estate will go to the Royal Victoria Infirmary, Newcastle.

ANTI-MOSQUITO MEASURES IN CALCUTTA.—In a paper read at a recent meeting of the Calcutta Health Committee Dr. C. A. Bentley, Sanitary Commissioner for Bengal, emphasised the urgent necessity of controlling malaria in Calcutta, and of reducing the danger from all kinds of mosquito-borne diseases. He advocated the formation of a permanent anti-mosquito department to ascertain the prevalence of mosquito-borne diseases and educate public opinion in regard to the mosquito danger by a properly organised publicity campaign.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Experiments on Living Animals.

ON the motion of Mr. BRACE, the Under Secretary at the Home Department, there has been ordered a return showing the number of experiments on living animals during the year 1916 under licences granted under the Act, 39 and 40 Vic., c. 77, distinguishing the nature of the experiments.

Military Service (Review of Exceptions) Act.

The Select Committee of the House of Commons which is inquiring into the working of the Military Service (Review of Exceptions) Act particularly in relation to medical examinations is continuing the taking of evidence. Mr. SHORTT is the chairman of the Committee.

On Thursday, July 5th, Colonel Sir J. BLAND-SUTTON, a member of one of the special medical boards and senior surgeon of the Middlesex Hospital, gave evidence. He dealt with the work of the special medical board, whose function it was to examine cases in which differences of opinions existed between medical recruiting boards on the one hand and the private medical advisers of the recruit or the specialists whom he had consulted on the other. Since October of last year until the present time the special board had examined 3449 men. In 289 cases the classification was raised, in 1202 it was confirmed, and in 1958 it was lowered. The 1958 contained 336 cases where the man was rejected for service altogether. He thought that it might be asserted that about 3 per cent. of the medical certificates produced by recruits might be described as not quite *bona fide*. He considered as serious the proportion of cases in which classifications had to be lowered by the special medical board. He regarded the 336 rejected cases as showing a seriously large percentage of error. He could not say whether the decisions of the medical boards with which the special board disagreed were formed too hurriedly or under great pressure of work. In cases where the special board had raised the classification it might be that the condition of the recruits might be improved since their examination by the ordinary medical boards. The principal complaints for which the special board had decided to reject men were epilepsy 48, mental deficiency 29, tuberculosis 62,

heart disease 917, and kidney disease 18. In reply to questions relating to the relative value of medical certificates placed before the board, Sir J. Bland-Sutton said that the family doctor generally made a dogmatic statement that a patient had some specific ailment and was unfit for military service, and that the certificates given by specialists were, as a rule, all verbiage and meant nothing, and the men paid double the ordinary fee for them.

Mr. PRINGLE brought to the notice of the witness the statement that a man fit to do work in civil life was fit to do some work in the Army.

Sir J. BLAND-SUTTON replied that he was unable to accept that principle without qualification. A man with a weak heart might make a fortune as a stockbroker, but if he were put in the Army he would drop down dead from exertion. Cases of that sort had occurred. He went on to say that if the special medical board found that a very glaring error had been committed by a medical recruiting board the president of the special board drew attention to it by a note on the back of the paper relating to the case. He also mentioned that when the special board passed a man for service in a particular class they did it on the assumption that he would be so employed.

Colonel LEWTAS, I.M.S. (retired), the president of No. 2 travelling medical board, gave evidence as to his experience with the medical examination of 35,000 recruits. In the event of differences of opinion arising between members of the board they were discussed, and in the few cases where they failed to come to a decision the opinion of the majority prevailed or the recruit was sent to a special hospital for examination.

The CHAIRMAN: As far as you know, have any steps been taken to let medical boards know of the Ministerial pledges in the House of Commons affecting the policy of the medical boards generally?

Colonel LEWTAS: I presume they would get that in the Army Council's instructions.

The CHAIRMAN: Do you know anything that contains a statement of Ministerial pledges?

Colonel LEWTAS: I do not know that I do. All we know about are the instructions coming from the Army Council.

Evidence of Surgeon-General Bedford.

On Monday, July 9th, Surgeon-General BEDFORD, Deputy Director of Medical Services in the Northern Command, gave evidence. He described the working of medical boards. He stated that the president must be in a position to supervise the whole work of the board and be consulted by the whole of the examiners in regard to difficulties. He must himself classify recruits. That came about on Feb. 23rd of this year. The presidents of boards in the Northern Command reported to him. His own experience had been entirely in the Army. He was of opinion that the regular officer made the best president.

The CHAIRMAN (Mr. SHORTT): Why?

Surgeon-General BEDFORD: Because he has intimate experience of the conditions of military service and of what is called for from the soldier in camp, barracks, and bivouac. He admitted that regular medical officers had in peace time no experience of passing men in the lower categories as they were not then accepted. The civilian practitioner had been trained all his life never to look further than the individual, and he was inclined to reject permanently men who were of potential value in the lower categories. In reply to a question whether the attention of the boards had been drawn to this, witness said that he had sent out in September of last year a memorandum on the subject. It was of a confidential nature.

The CHAIRMAN read the memorandum which called attention to the very large proportion of men found permanently unfit by some of the boards, and to the great variety of results shown in a comparison of the returns of the boards. It was emphasised that every man found permanently unfit by a board was lost to the Army, and he could not be called up for re-examination or service of any kind. In future boards must understand that any man who was of any potential use to the Army for fighting, marching, digging, hauling, cooking, engine-driving, motor-driving, or as a draughtsman, tailor, electrician, baker, telegraphist, or a member of one of the trades or occupations necessary for the maintenance of the Army must be taken and placed in one category or another, and must not be permanently lost to the Army by being found unfit. Some boards were alive to this. Other boards were allowing enormous numbers of men to slip through their hands and become lost to the service. This must now cease and all boards must approximate their percentage of rejections to the lowest figures of the category appearing in the returns under review. Was there any difficulty (the CHAIRMAN asked) in getting that order acted upon by civilian doctors?

Surgeon-General BEDFORD: I think the boards responded to it very well. The memorandum was issued after a meeting at the War Office, which, he thought, took place in September.

The CHAIRMAN: Was it agreed that a memorandum should be sent out?

Surgeon-General BEDFORD: The general purport of the meeting was that there was a preventible leakage on account of the high percentage of rejections.

The CHAIRMAN: Did Sir Alfred Keogh know that you were to send this out?

Surgeon-General BEDFORD: I presume that he must have known that we were to do something to interpret the policy of the War Office with regard to this high percentage of permanently unfit.

The CHAIRMAN: You took it at the meeting that it was understood something should be done?

Surgeon-General BEDFORD: Yes.

The CHAIRMAN next took up a circular letter sent out by Surgeon-General Bedford on June 22nd, in which it was stated that men were being passed who were of no potential use to the Army. He had (the letter proceeded) been inspecting certain labour units, and he was shocked to see the specimens of humanity who had been accepted as of potential value to the Army—men almost totally blind, deformed, of the poorest physique, cases of severe rheumatism, cases of paresis which rendered locomotion almost grotesque, and several cases of insanity. This scandal must be stopped at once. Unless a recruit was of some potential value to the Army he should be rejected.

Surgeon-General BEDFORD explained that this communication was made after he and the general officer commanding had made an inspection of a labour battalion. He presumed that the pledges of Ministers would be communicated in the form of instructions from the Army Council.

In answer to Sir GODFREY BARING, Surgeon-General BEDFORD stated that the labour units which he inspected before the issue of the circular letter were the dregs of an enormous command, and they were taken out of very large numbers of men indeed. He thought on the whole the work of the boards had been good.

Sir GODFREY BARING: Do you now think the word "scandal" is too strong?

Surgeon-General BEDFORD: Yes. I should not have used the word "scandal." I was very much annoyed when I saw the particular units in question. They are the dregs of an enormous number of men, and when you have regard to these numbers the cases in question formed a minute proportion of the whole.

Surgeon-General JENCKEN, of the Eastern Command, also gave evidence. He stated that he had had many complaints as to the Mill Hill board, but he regarded them as unjustifiable. He was asked by the committee to furnish the correspondence on the subject of the complaints.

The Southern and Scottish Commands.

On Tuesday, July 10th, Surgeon-General BIRRELL, D.D.M.S., Southern Command, gave evidence. He spoke of the system of medical boards in that area. His experience was that the percentage of rejections varied very much, but some of the boards worked in agricultural and others in town districts. The percentage of rejections was much larger in the towns than in the country, and he thought that was due to the difference in the physique of the men. In cases of doubt the presidents of boards decided in consultation with the members. A president did not decide against the opinion of his board. The Army Council had issued an instruction that the president was to classify recruits, but he would do that after consultation with the boards. Witness went at considerable length into the administrative work of his office.

Replying to Mr. PRINGLE, Surgeon-General BIRRELL said that in his view a man should be put into the category for which he was fit at the time he was examined. The standard of fitness for general service had not been lowered, but some disabilities for which men were formerly rejected were not now considered as sufficient for disqualification. A medical board would attach importance to a certificate given by a man's own medical man, but he admitted that an Army Council instruction forbade civilian practitioners who had received commissions giving such certificates.

Mr. PRINGLE remarked that this would prevent large numbers of men producing the only evidence which they could otherwise obtain from a medical man.

The CHAIRMAN read two circular letters. One, it was stated, was sent out by Sir Alfred Keogh, Director-General of Medical Service, to the Deputy Directors of Medical Service. It was dated July, 1915, and it ran:—

I wish you to regard what I say as confidential. It is imperative for you to get as many men as possible not fit for war service put into a category as fit for garrison service abroad. We have so many civilian medical men working with us that you will have to be very strong in your action as regards the acceptance of their opinion when they reject men as unfit for garrison service abroad. This is a time when only very severe disability—heart disease, kidney disease, and so on—should be regarded as rendering men unfit. All those disabilities which in peace time we have been accustomed to consider should now go to the wall—varicocele, varicose veins, hammer toes, and a hundred and one other things which do not incapacitate men for ordinary garrison work. I would not write to you on this subject if the matter were not one of primary importance, concerning which Lord Kitchener is very anxious. Take it upon yourself to overrule decisions which place men in categories as unfit

for garrison service abroad for disabilities only which do not incapacitate very completely.

Surg.-General BIRRELL said that he had not seen this letter

The CHAIRMAN then read another letter from Sir Alfred Keogh issued after the meeting at the War Office in September, 1916. This letter said:—

Please issue orders to medical boards in your command that they are not totally to reject any man who can perform any kind of work without danger to himself or to others. Sedentary work does not mean clerical work only. It means any class of work which a man can do not involving the class of duties appropriate for other categories. Every man who can earn a livelihood in civil life can do something in the Army and it is perfectly ridiculous the continuance of these enormous numbers of rejections in each command. Will you please stop it at once and give very definite orders to your boards?

Surgeon-General BIRRELL said that on receipt of this letter he sent out a telegram saying that no man must be totally rejected for the Army who was fit for any work in it.

Surgeon-General CULLING, D.D.M.S., Scottish Command, was also called as a witness. It was not the case, he said, that in his command the policy was followed of inculcating into medical boards that owing to the difficulty of securing men for the higher categories they should turn the scale against the individual and in favour of the Army in cases where there was doubt. He was present at the War Office meeting of surgeons-general in September of last year, and he had afterwards issued a circular to presidents of medical boards that they were not to reject any men who could perform any kind of work without danger to themselves and others. It stated that the enormous number of rejections in his command ought to stop at once. He had not personally gone previously into the number of rejections in his command. A document dealing with heart murmurs had also been sent out from his office.

Answering Mr. PRINGLE, he admitted that the circular which he had sent out was done automatically as the result of the meeting in London. It was not confidential and it was marked "Urgent."

On Wednesday, July 11th, Surgeon-General HATHAWAY gave evidence as to the medical boards in the Western Command.

HOUSE OF COMMONS.

WEDNESDAY, JULY 4TH.

Lieutenant-Colonel Carter, I.M.S.

Answering Sir J. JARDINE and Mr. HOUSTON, Mr. CHAMBERLAIN said: Major Carter has suffered no injury and will suffer none in his career on account of the efforts which he made to bring to notice and to secure a remedy for the deplorable defects in the medical arrangements in Mesopotamia. I am only waiting till the copies of the report of the Commission can reach India to bring his conduct to the notice of the Government of India with a view to his services receiving suitable recognition. Meanwhile I may say that on account of his special knowledge and experience he was sent home in May, 1916, to advise as to the fitting out of hospital ships, &c., building in this country for Mesopotamia, and he has been engaged on this and similar work at the War Office ever since. Far from desiring to penalise him, the Government of India has more than once applied for his services, but on each occasion the War Office replied that he could not be spared from the valuable work he is now doing. Major Carter was granted the temporary rank of lieutenant-colonel on August 8th, 1916. He held the rank of major for three years previous to that date. He joined the Indian Medical Service from this country in 1902 at the age of 26.

Medical Board of the India Office.

Mr. CROOKS asked the Secretary for India whether the decisions of the medical board of the India Office were decided by a majority of the members; whether he would consider the advisability of adding a civilian doctor of eminence; and whether some provision for appeal against a decision or for a re-hearing could be made, in view of the fact that a decision at the present time, against which no appeal could be made, might in error cut short a promising career in the Indian Service.—Mr. CHAMBERLAIN answered: The India Office medical board consists of a president and one member. Their reports are submitted under their joint signatures. In the event of a difference of opinion that of the president would, no doubt, prevail. A suggestion that a civil medical practitioner should be added to these two I.M.S. officers was considered by me in Council about 18 months ago, but it was considered that there were not sufficient grounds for enlarging the present board. Having regard to the special character of their duties, I attach importance to the possession by members of the board of experience of the Indian climate and conditions. I am not aware of any such case having occurred as that suggested in the last part of the question. But if the honourable Member can give me particulars I will look into it. The practice of the board in all doubtful cases is to give the officer the benefit of the doubt, especially when pay or pension is involved.

Prisoners of War in Turkey.

Replying to Mr. MARRIOTT, Mr. J. F. HOPE (representing the War Prisoners Department) said: His Majesty's Government is unfortunately aware that there has been a very high rate of mortality among all the British non-commissioned officers and men, prisoners of war in Turkey, and constant representations have been made to the Turkish Government with a view to the improvement of their condition. The Ottoman Government recently consented to a concentration at one or two camps of all invalid prisoners of war with a view to better medical attention, but His Majesty's Government has yet to learn to what extent this measure has been carried out and what benefit has ensued from it. The prisoners of war in the Taurus and Amanus regions are being attended by British medical officers.

Military Hospitals in Oxford.

Mr. MARRIOTT asked the Under Secretary for War whether patients suffering from malarial fever were being sent for treatment to the military hospitals in Oxford; if so, whether Oxford had been specially selected for the treatment of patients suffering from this disease; and would he state the grounds upon which this selection had been made.—Mr. MACPHERSON replied: The answer to the first part of my honourable friend's question is in the affirmative. With regard to the remaining parts of the question a hospital in Oxford is one of a number of hospitals in the United Kingdom in which cases of malaria are being treated by specially qualified medical officers. The hospitals referred to were selected as convenient centres on the advice of the leading malaria experts.

Regulation Flour and Health.

In reply to Mr. ALLEN BAKER and Mr. HASLAM, Mr. BRIDGEMAN (speaking on behalf of the Ministry of Food) said: An expert committee is now engaged in the investigation of all questions relating to the effect which the Government regulation flour has upon the health of the community. The conclusion so far is, that while bread made from this flour, when properly baked, is perfectly wholesome, there are unavoidable local variations in the flour used and in the methods of bread-baking, and that these points require constant attention. It is inevitable that in the manufacture and use of a new and unfamiliar material for bread difficulties should arise, but I see no reason why difficulties which have occurred and been overcome in other countries should not be overcome here. In any case, having regard to the prospective supplies, there is no likelihood of being able either to lessen to any substantial extent the percentage of extraction from wheat or to admit the manufacture of a pure white flour.

Sterilised Meat in Scotland.

Mr. MUNRO (Secretary for Scotland), in reply to Mr. ANDERSON, wrote: I understand that the local authorities at Glasgow, Dundee, Hamilton, and Aberdeen have made, or are considering, arrangements for sterilising parts of specially selected carcasses of tuberculous animals for sale to the general public. The methods adopted have the approval of the Local Government Board for Scotland, who are satisfied that the selection of carcasses and the methods of sterilisation are such that the meat is rendered harmless and may be consumed without injury to health; and that it forms a useful addition to the food-supply of the country.

THURSDAY, JULY 5TH.

The Gratuity to Retiring Naval Surgeons.

Mr. HOHLER asked the Secretary to the Admiralty—

Whether the position of a naval surgeon retiring before the war with a gratuity was as follows: that the Admiralty had no further claim on his services, that as a voluntary act on his part he could place his name on an emergency list which in case of his being called upon to serve would entitle him to the rate of pay he was receiving when he retired plus a bonus of 25 per cent., and that for this voluntary act he received no extra gratuity or reward of any kind; whether he was aware that some ten or more naval surgeons who had retired before the war with a gratuity, and who had placed their names on the emergency list, had been called upon to serve but were not receiving the pay promised, the Admiralty claiming to deduct, and deducting, from their pay a sum equal to the interest on their gratuity, and would he refer to any statute, regulation, or Order in Council made before the war that justified this; if not, would he at once direct the repayment of the sums illegally deducted with interest at 5 per cent. to these naval surgeons; and would he state on what principle this deduction had been made and the rate of interest taken.

Mr. MACNAMARA answered: The position of the officer in question is indicated in the first part of the question. On being called out he receives (1) the rate of pay earned prior to withdrawal, and (2) a bonus of 25 per cent. in lieu of any further retiring allowance. The gratuity paid on withdrawal is in effect a commuted allowance and is comparable with the annual allowance payable to officers retiring under other conditions. The bonus is paid to both the emergency officer and the retired officer when re-employed and when the latter has his retiring allowance suspended, it is consistent to deduct the annual value of the gratuity received by the former officer. The authorising regulation is Order

in Council, May 13th, 1901, No. 157, under which the Treasury has approved both the payment of the bonus and the deduction referred to. Any doubt as to the legality of the decision regarding the latter would, therefore, be equally applicable to the former. The annual value of the gratuity is calculated on the basis of the cost of an immediate life annuity at the date of the withdrawal under the Post Office annuity table in force at the time.

Mr. HOHLER: Does the right honourable gentleman think you ought to give a man a gratuity and subsequently charge interest on it when the man rejoins on his own initiative?—Mr. MACNAMARA: The heart of the matter is this. The gratuity is considered to be a commuted allowance. The officer retired on allowance and re-employed got his allowance suspended. So it is deemed equitable to deduct the annual value of the gratuity from the officer retired on the same.

Mr. HOHLER: Has not the gratuity been used to get a practice?—Mr. MACNAMARA: I should be glad if my honourable and learned friend would argue his view, for which I have always much respect, before our Medical Director-General, the Accountant-General, and myself.

Medical Women Employed in France.

Mr. CURRIE asked the Under Secretary for War—

What differences, if any, as to rank, messing, gazetting, pay, allowances, badges, pensions, and status generally existed between medical men belonging permanently or temporarily to the Royal Army Medical Corps and duly qualified medical women employed, or about to be employed, in France or elsewhere abroad; whether an assurance could be given that any outbreak of illness amongst women attached as workers to our Army in France would be adequately dealt with; and whether Sir Alfred Keogh, as chief of the Army Medical Service, was the authority officially responsible for the medical care of women so serving.

Mr. MACPHERSON wrote in reply: The complete details as to pay, allowances, pensions, &c., are not yet settled. The Director-General, Army Medical Service, Sir Alfred Keogh, is responsible for the employment of these ladies and for dealing with illness amongst them.

Tuberculosis Schemes in Ireland.

Mr. PATRICK MEEHAN asked the Chief Secretary for Ireland whether he was aware that the grants made to the Queen's County Insurance Committee for sanatorium benefit for insured persons were inadequate and had been decreasing annually for the past five years; whether he was aware that the reduction of the grants had deprived insured persons of benefits to which they were entitled; and whether he intended taking any action in the matter.—Mr. DUKE wrote in reply: The returns of expenditure made by county councils in connexion with tuberculosis schemes indicate that there is a falling-off in the estimated receipts from the Insurance Committees in respect of the treatment of insured and exempt patients in the current year as compared with last year. The consequent deficit will fall equally on the Exchequer Maintenance Grant and the local rates. The question of grants for sanatorium benefit can only be dealt with by the National Health Insurance Commission.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.

ALDOUS, G. F., F.R.C.S. Edin., has been appointed Consulting Surgeon to the Kingsbridge Cottage Hospital.

HAYTON, C. H., F.R.C.S., Honorary Assistant Surgeon to the Ear, Nose, and Throat Department at the Prince of Wales's General Hospital, Tottenham.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

ABERDEEN ROYAL ASYLUM.—Temporary Assistant Physician. Salary from £250 to £350 per annum, with board, &c.

BATH COUNTY BOROUGH.—Temporary School Medical Officer. Salary £500 per annum.

BIRKENHEAD BOROUGH HOSPITAL.—House Surgeon. Salary £250 per annum and war bonus, board, &c.

BIRMINGHAM GENERAL DISPENSARY.—Temporary Tuberculosis Officer. Salary £600 per annum.

BOURNEMOUTH, ROYAL NATIONAL SANATORIUM FOR CONSUMPTION AND DISEASES OF THE CHEST.—Resident Medical Officer and Clinical Tuberculosis Officer. Salary £430 per annum, with board, &c.

BOURNEMOUTH, ROYAL VICTORIA AND WEST HANTS HOSPITAL, Poole-road—Resident House Surgeon for six months. Salary £250 per annum, with board, &c.

BRISTOL ROYAL INFIRMARY.—House Physician and House Surgeon. Salary at rate of £120 per annum, with board, &c.

DEVONPORT, ROYAL ALBERT HOSPITAL.—House Surgeon Salary £200 per annum, with board, &c.

DURHAM COUNTY COUNCIL.—Female Assistant School Medical Officer. Salary £300 per annum, &c.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.—Resident Medical Officer. Salary £200 per annum, with board, &c. Also Assistant Resident Medical Officer. Salary £100 per annum, with board, &c. Also House Physician for six months. Salary 30 guineas.

INSURANCE COMMITTEE FOR THE COUNTY OF LONDON.—Medical Adviser.

ITALIAN HOSPITAL, Queen-square, London, W.C.—House Surgeon for six months. Salary £150 per annum, with board, &c.

LIVERPOOL EYE AND EAR INFIRMARY, Myrtle-street.—Female House Surgeon.

MACCLESFIELD GENERAL INFIRMARY.—House Surgeon. Salary £200 per annum, with board, &c.

MANCHESTER, HULME DISPENSARY, Dale-street, Stretford-road.—House Surgeon. Salary £250 per annum, with apartments, &c.

MARGATE, ROYAL SEA BATHING HOSPITAL FOR SURGICAL TUBERCULOSIS.—Surgeon. Salary, if resident, £150 per annum, with board, &c.; if non-resident, salary at rate of £250 per annum

METROPOLITAN BOROUGH OF BETHNAL GREEN.—Female Assistant Medical Officer of Health. Salary £400 per annum.

NATIONAL HOSPITAL AND UNIVERSITY COLLEGE HOSPITAL SCHOOL OF MASSAGE AND ELECTRICAL TREATMENT, Queen-square, W.C.—Female Head of the School. Salary £200 per annum, with board, &c.

NETLEY, WELSH HOSPITAL.—Medical Officer. Salary £400 per annum, with board, &c.

NORTHAMPTONSHIRE WAR HOSPITAL.—Resident Medical Officer. Salary £1 daily, with board, &c.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, E.—House Physician for six months. Salary £100 per annum, with board, &c.

QUEEN MARY'S HOSPITAL FOR THE EAST END.—House Surgeon.

ROYAL FREE HOSPITAL, Gray's Inn-road, W.C.—House Physicians. Salary £50 per annum, with board, &c.

ROYAL LONDON OPHTHALMIC HOSPITAL, City-road, E.C.—Third House Surgeon. Salary at rate of £50 per annum, with board, &c.

ST. ANDREW'S HOSPITAL, Dollis Hill, London, N.W.—Resident Medical Officer for six months. Salary £323 15s., with board, &c.

SHEFFIELD ROYAL INFIRMARY.—House Physician. Salary £120 per annum, with board, &c. Also Two House Surgeons. Salary £120 per annum, with board, &c.

SOUTH LONDON HOSPITAL FOR WOMEN, South Side, Clapham Common, S.W.—Female House Physician for six months. Salary at rate of £100 per annum, with board, &c. Also Anæsthetist for Tuesday afternoons. Salary 10s. 6d. per attendance.

SUNDERLAND COUNTY BOROUGH EDUCATION COMMITTEE.—Temporary School Medical Officer. Salary £450 per annum.

WEST RIDING OF YORKSHIRE, MIDDLETON-IN-WHARFEDALE SANATORIUM, near Ilkley.—Assistant Resident Medical Officer. Salary £325 per annum.

WINCHESTER, HAMPSHIRE COUNTY COUNCIL.—Temporary Assistant County Medical Officer of Health. Salary £300 per annum.

NOTICE is given of a vacancy for a Medical Referee under the Workmen's Compensation Act, 1906, for the Macclesfield and Congleton and Sandbach County Courts in County Court Circuit No. 9. Applications should reach the Private Secretary, Home Office, not later than August 2nd next.

Births, Marriages, and Deaths.

BIRTHS.

DAVISON.—On July 3rd, at a private nursing home, the wife of H. Glen Davison, M.D., Captain, R.A.M.C., of a daughter.

EDWARDS.—On July 6th, at Grosvenor-street, Mold, North Wales, the wife of Roger B. Edwards, M.B., B.S., of a son.

PITT.—On July 1st, at St. Hildas, 326, Hoe-street, Walthamstow, the wife of W. O. Pitt, M.D., D.P.H., of a son.

SWAN.—On July 6th, at Wimpole-street, W., the wife of R. H. Jocelyn Swan, M.S. Lond., F.R.C.S., Major, R.A.M.C., of a daughter.

WANKLYN.—On July 7th, at a nursing home, Worthing, the wife of Captain W. McC. Wanklyn, R.A.M.C., of a daughter.

MARRIAGES.

SIMSON—HOOPER.—On July 7th, at St. Andrew's, Ashley-place, Lieutenant-Colonel Harold Simson, R.A.M.C., to Lilian Sybil Doulton, only daughter of Mr. and Mrs. Kinnersley Hooper, of Little Tangley, Wonersh, near Guildford, and St. James's Court.

WATSON—HAMENDT.—On June 16th, at New St. Andrew's Church, Toronto, Benjamin Philp Watson, M.D., F.R.C.S.E., F.A.C.S., Professor of Obstetrics, University of Toronto, to Angèle, daughter of Monsieur and Madame Hamendt, St. Nicolas, Belgium.

DEATHS.

ATKINSON.—On July 7th, suddenly, at Claramont, Felixstowe, Lieutenant Ambrose Atkinson, R.A.M.C., aged 57.

GREER.—On June 16th, killed in action, Captain Morrice Greer, R.A.M.C.

MACKINLAY.—On July 1st, at The Green House, Coatham, Redcar, James Egan Harrison Mackinlay, M.R.C.S., L.R.C.P., J.P.

PILCHER.—On July 3rd, at Gloucester-road, S.W., Colonel J. G. Pilcher, F.R.C.S., I.M.S. (retired), in his 79th year.

WHINCUP.—On July 2nd, in France, accidentally drowned, Lieutenant Frank Whincup, R.A.M.C., of Shrewsbury, aged 43.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Notes, Short Comments, and Answers to Correspondents.

HEELS AND HEALTH.

IT appears that the Legislature of Illinois has fixed a maximum height for heels of one inch and three-eighths. 70 per cent of the women concerned appear to wear heels two inches high, and the majority of the remainder heels of one inch and five-eighths. The order has been made on the grounds of economy. Heels are not seen in ancient footgear, and not all the men wore footgear at all, so that their abuse is a comparatively modern one. Military men have generally worn different boots according to rank, while men of lower rank went barefooted in all early civilisations, chalking their feet or using other preparations. At times women have made use of wooden soles raised some inches from the ground, but these were really low stilts and not high heels. The present-day high heels are often called Louis XV. heels, and the name strictly refers more to the shape of the heel which has the curves introduced at that flamboyant epoch, regardless of all orthopædics. A heel which has become somewhat popular during the last few years is the straight-backed heel, or, as it is called, the "Cuban" heel. If the heel is not sufficiently broad the foot wobbles at each step, hesitating and trying to find its balance like the foot of a poor tight-rope walker. This is a strain on the tendons of the foot and the weak ankle. The height of heels has a medical bearing, and having regard to some of the footgear which fashion exposes among modern women with unusual frankness, we suggest that this bearing is lost sight of.

THE CAUSATION OF SEX.

To the Editor of THE LANCET.

SIR,—In your notice of Mr. Dawson's book in your issue of July 7th you observe that Mr. Dawson contends "that male ova come exclusively from the right ovary and female ova from the left ovary." About 26 years ago I removed the right ovary from a lady about 40 years of age whose menses had been suppressed for two years. Four weeks after the operation she menstruated once and then became pregnant, giving birth to a girl (still living and a mother). After this in due time she became pregnant again and gave birth to a boy who was married two years ago. The lady is still living.

I am, Sir, yours faithfully,

J. E. BURTON,
Consulting Surgeon, Hospital for Women, Shaw-street, Liverpool.

July 10th, 1917.

A BELGIAN DOCTOR'S VIEW OF SOCIAL MEDICINE IN ENGLAND.

IN a recent number of the *Archives Médicales Belges* Dr. René Sand, medical officer in charge of the Ambulance at La Panne, writes with appreciation of the efforts at social amelioration which are being made in this country during the war. His conclusion is as follows:—

Le plus grand changement qui soit survenu en Angleterre dans ces deux dernières années n'est pas, comme pourrait le croire un esprit superficiel, l'institution du service militaire obligatoire—il n'est qu'une innovation—c'est la naissance d'un esprit public nouveau, qui repousse les palliatifs, n'accepte plus de temporiser, mais taille ses revendications à la mesure de l'intérêt général. Le coût des réformes sociales, leur amplitude, leur nouveauté faisaient hésiter l'Anglais de 1914. Mais la guerre lui a appris à compter par milliards de livres et par millions d'hommes; elle l'a contraint à résoudre en quelques semaines des problèmes aussi complexes que l'alimentation d'une nation entière; elle l'a habitué à l'action méthodique, coordonnée, disciplinée; elle lui a enseigné la hardiesse, la rapidité, le sacrifice des intérêts individuels; elle lui a montré les bienfaits de l'organisation, préparant ainsi aux réformes le terrain le plus favorable. Déjà pendant la guerre bien des innovations ont été introduites. Mais c'est dans la création d'un esprit nouveau que réside le plus beau gage d'avenir.

THE ECONOMIC PRODUCTION AND DISTRIBUTION OF MILK.

WITH reference to our observations on the keeping properties of condensed milk in a leading article under the above heading in our issue of last week, Messrs. Nestlé and Anglo-Swiss Condensed Milk Company, of 6 and 8, Eastcheap, London, E.C., who are well known as the largest producers in Europe and elsewhere of both the sweetened (not containing more than 40 per cent. of cane sugar) and unsweetened variety of full-cream condensed milk, write that: "1. Sweetened condensed milk, when properly made, will keep perfectly good for 9, 12, or more months, but as it is the object to preserve it during the summer for use during the winter, a maximum period would not exceed nine months between production and consumption. 2. Unsweetened condensed milk relies on complete sterilisation for its keeping properties and is guaranteed in any climate for two years, while it will keep intact for any period beyond that so long as the tin is unopened. 3. The economy in sugar, *qua* sugar, is such when sweetened condensed milk is used that so long as there is sugar to use for condensing whole milk the cost of a tin of milk compares favourably with the prices of the sugar and raw milk it contains." These observations are of special interest in view of the urgent need of preserving present supplies, while they are plentiful, in order to make up for the shortage of the coming winter.

S. D. S.—The literature is copious, but the best works are necessarily not written for lay readers.

T. C. next War.—The inequality to which attention is drawn has more than once been brought to the notice of the authorities.

G. B.—All preparations of paraffin tend to cause indurations when injected into the tissues. In the case of mercurial injections the quantity of liquid paraffin is so small that induration rarely results; theoretically at least a true oil should be preferable for the preparation of a mercurial cream.

F. C. P.—The important word "not" was dropped out, as fortunately the context shows. We are obliged for having the error pointed out. "Accustomance," the word of the learned lecturer, is in the Imperial Dictionary; "informatory" is now a much-used adjective.

Medical Diary for the ensuing Week.

SOCIETIES.

ROYAL SOCIETY OF MEDICINE, 1, Wimpole-street, W.

MEETING OF SECTION.

Thursday, July 19th.

DERMATOLOGY (Hon. Secretaries—J. E. R. McDonagh, Henry MacCormac): at 5 P.M.

Cases (at 4.30 P.M.).

Dr. Parkes Weber: (1) Macular Atrophy of the Skin associated with Ordinary Vitiligo; (2) Hirsuties in a Child; (3) Unilateral Striæ Atrophicæ of the Thorax (photograph).

And other cases.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

POST-GRADUATE COLLEGE, West London Hospital, Hammersmith-road, W.

MONDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye. Dr. Simson: Diseases of Women.

TUESDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

WEDNESDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

THURSDAY.—2 P.M., Medical and Surgical Clinics. X Rays. Mr. Gray: Operations. Mr. B. Harman: Diseases of the Eye.

FRIDAY.—10 A.M., Dr. Simson: Gynæcological Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Baldwin: Operations. Dr. Banks Davis: Diseases of the Throat, Nose, and Ear. Dr. Pernet: Diseases of the Skin.

SATURDAY.—10 A.M., Dr. Saunders: Diseases of Children. Dr. Banks Davis: Operations of the Throat, Nose, and Ear. Mr. B. Harman: Eye Operations. 2 P.M., Medical and Surgical Clinics. X Rays. Mr. Pardoe: Operations.

ROYAL INSTITUTE OF PUBLIC HEALTH, Lecture Hall of the Institute, 37, Russell-square, W.C. 1.

Course of Lectures and Discussions on Public Health Problems under War and After-war Conditions:—

WEDNESDAY.—4 P.M., Lecture XIV.:—Lieut.-Col. S. M. Copeman, R.A.M.C.(T.F.): Sanitation in War Time. Followed by a discussion.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.*

MANAGER'S NOTICE.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 6.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

METEOROLOGICAL READINGS.

(Taken daily at 8.30 a.m. by Steward's Instruments.)

THE LANCET Office, July 11th, 1917.

Date.	Rain-fall.	Solar Radio in Vacuo.	Maxi-mum Temp. Shade.	Min. Temp.	Wet Bulb.	Dry Bulb.	Remarks.

Extract from **LANCET.**

VITAMOGEN.

"The following analysis which we have made shows, apart from vitamines, that the preparation contains all classes of food substance: Moisture, 7·00 per cent.; mineral matter, 7·50 per cent. (equal to 2·50 per cent. phosphoric acid); protein, 24·96 per cent.; sugar, 20·83 per cent.; starch, 26·25 per cent.; fat, 1·51 per cent.; cellulose or fibre, 11·95 per cent. The preparation is largely soluble in cold water, the total soluble matters amounting to 62·80 per cent. The vitamines, of course, belong to a group of basic substances, but Vitamogen also contains, as will be seen from the analysis, a rich proportion of phosphoric acid."

Vitamogen

Regd.

Vitamine — "Tonic Food."

THE PRACTITIONER:—

"This new concentrated food contains, in addition to **Vitamines** many other highly nutritive bodies, and is rich in organic phosphorus. *(Analysis in detail is also given.)*

"**VITAMOGEN** is recommended for children, especially for those suffering from scurvy-rickets, or rickets, and in 'deficiency' diseases like Beri-Beri. It is useful in any form of nervous disease, such as Neurasthenia, Hysteria, Neuritis, and so forth, and for its **general tonic-effect in convalescence after severe illness.**"

VITAMOGEN is put up in 2/- and 4/6 tins containing approximately ½ lb. and ¾ lb. respectively, so that it is within the reach of all classes and obtainable of any chemist. Special terms to medical men and Hospitals.

VITAMOGEN owes its origin to our Chairman, who also invented "VIROL."

Telegrams: "KEEPWORTHY, LONDON."
Telephone— 1215 HOLBORN.

Vitamogen LTD. 24, HOLBORN, LONDON, E.C.1.

An original tin, with literature on the Vitamines, will be sent as a sample free to medical men on request.

Battley's Solution of Opium.

Liquor Opii Sedativus

(BATTLEY)

THE OLDEST and still THE BEST Hypnotic and Sedative.

Advantages:

- ¶ May be given with the greatest safety, being pure and free from harmful matter.
- ¶ No disagreeable after-effects follow its use.
- ¶ Never varies in strength.

The *Medical Annual* writes:

"**Battley's Solution of Opium** is a common word in the Practitioner's vocabulary. It has gained its reputation by its intrinsic value as a remedy which contains all that is sedative and anodyne in opium without its resinous constituents, which are, therapeutically speaking, impurities."

Strength—Twice that of Tinctura Opii B.P. Usual Dose—5 to 15 minims.

Issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.

NOTE.—We do not guarantee our preparations unless in original bottles with the autograph of Richard Battley over each cork and on the label, without which none is genuine.

Sole Manufacturers:

BATTLEY & WATTS, 18 Wellclose Sq., London, E.

Telegraphic Address: "Sedative, London." *Telephone:* Central 2183.

RELIABLE LIGATURES.

In ligature and suture material, there can be nothing better conceived for the sterile and aseptic preparation and conveyance of the same, than a hermetically sealed glass tube. Catgut or silk, as it is prepared in our laboratories must reach the surgeons' hands in absolutely sterile condition.

This is our positive guarantee.

BREAKABLE TUBES.

These Tubes possess advantages known to no other tubes. The perfection of Johnson & Johnson's Laboratory preparation of Ligature and suture material cannot be obtained elsewhere.

This preparation being British, inability to obtain supplies need not be anticipated.

FORMULA.—Casein 95%, Glycerophosphate of Sodium 2½%, Glycerophosphate of Calcium 2½%.

Its use is indicated in the treatment of Neurasthenia, Tabes Dorsalis, Neuralgia, Nervous conditions in which an excess of phosphates are excreted in the urine, Phthisis, Chronic Dyspepsia, Anæmia, Insomnia, and wasting diseases generally.

The presence of the Calcium salt gives it a high therapeutic value in the treatment of Rickets.

BLENOSAN CAPSULES

As a routine treatment for GONORRHŒA

BLENOSAN CAPSULES contain, in addition to the finest East India Santal Oil, a specially prepared extract of Kava Kava, possessing a full proportion of the **alpha** resin, the anæsthetic and diuretic properties of which are of great value in lessening the pain and irritation due to inflammatory conditions of the urinary canal.

KEROL

KEROL combines all the properties which go to the making of an ideal preparation.

It has been shown to be practically non-toxic, non-irritant and non-corrosive—a combination of properties which make it the one preparation which can be used with perfect confidence wherever the use of either a disinfectant or antiseptic is indicated. It is of high and definite germicidal value and is perfectly homogeneous

KEROL is highly recommended by Bacteriologists and by prominent members of the Medical Profession.

KEROL CAPSULES

INTESTINAL. These are of great value where intestinal antisepsis is indicated. In a comparatively short space of time the coli content of the intestine is reduced by over 99 per cent. They are non-irritant and perfectly safe.

STOMACHIC. For use in cases of stomach fermentation and other gastric troubles, and are of great value in reducing the number of malign organisms prior to administration of treatment with lactic ferments, i.e., sour milk, etc.

Samples and literature sent free to any Medical Practitioner

QUIBELL BROS. LTD
153 Castlegate
NEWARK

"Eminent authorities may differ materially upon certain points, but when all agree upon one opinion, the latter cannot fail to carry conviction and clinch a fact."

For fifteen years past the most eminent authorities of Europe and America have agreed, without a single dissenting voice, that no nutritive preparation is assimilated by the organism with the regularity, certainty, and rapidity of

Sanatogen

For the specific virtue of Sanatogen is something more than the sum of the action of its two component parts. Both these are of well-tried value, but in Sanatogen they are so blended and chemically combined as to form a new compound with properties exactly adapted to the wants of the human organism, and with quite unexpected therapeutic qualities.

Again and again has it been found—especially since the war began—that no mechanical mixture of these ingredients, no imperfect attempt to unite them organically, can result in such benefit to the patient as Sanatogen admittedly yields.

Sanatogen is now the absolute property of an all-British company, and is manufactured at Penzance by the original unique processes on which its efficacy depends.

Though the cost of manufacture has greatly increased, **the retail prices are unchanged**; and it is worth noting that these work out at only about sixpence per day for the usual dosage. We mention this because many physicians regard Sanatogen as an expensive product, though in reality it is cheaper in use than many less valuable preparations which are not so regarded.

For Samples and Literature apply to

GENATOSAN, LTD.

(British Purchasers of the Sanatogen Co.)

Chairman: Lady Mackworth.

12, CHENIES ST., LONDON, W.C. 1.

Sanatogen will later on be re-named "Genatosan" to distinguish it from so-called substitutes.

The Tonic for Summer

WHERE trying weather and jaded nerves combine to defeat the bodily vigour, Hall's Wine is especially to be recommended by the medical profession.

For the last five and twenty years it has proved its worth in cases of nerve-weakness and overstrain, and has earned an enviable reputation for reliability.

During the summer months it is particularly valuable in maintaining the physical energy at its normal level.

Hall's Wine stimulates the respiration, increases the oxygenation of the blood, and is a powerful aid to digestion.

In all cases of Nerves, Weakness, Anæmia, Insomnia, Depression, and in Convalescence after illness, Hall's Wine may safely be prescribed by doctors as the supreme tonic restorative.

Hall's Wine

THE SUPREME TONIC RESTORATIVE

Of all Wine Merchants, Chemists, and Grocers with a Wine Licence.

Extra Large Size 4/6. *Smaller size* 2/9.

STEPHEN SMITH & CO., LTD., Bow, London. 729

MADE IN AUSTRALIA

"EUMENTHOL" TOOTH POWDER

(HUDSON)

A fragrant, palatable, non-toxic, non-irritant germicidal powder, being a combination of Formalin, Menthol, &c., with a diatomaceous earth in conjunction with a pure high-grade peroxide (MgO_2). The Menthol is in chemical combination with Formalin to form the new antiseptic compound, Dimenthol-Formal, CH_2 ($C_{10}H_{19}O_2$) M.P. 56, 5°C. (Brochet), and unites an antiseptic action twice more powerful than Sublimate, with a very decided effect in hardening the Gums. A strength of 1 in 1000 kills all the salivary bacilli in less than two hours. Dessirier recommends Dimenthol-Formal for the treatment of aphthæ.

"Eumenthol" Tooth Powder on dissociation (in contact with water or the Oral Fluids) liberates free active Oxygen, and Hydroxide of Magnesia in a minutely divided state is produced.

THE LANCET states: "This Tooth Powder is designed on sound principles and is very agreeable to use. The distinctive feature about it is that, in addition to some approved germicides, it contains MgO_2, which readily parts with free oxygen, as our experiments have shown."

London Agents:
Wholesale—F. NEWBERY & SONS, Ltd., 27 & 28, Charterhouse Square, E.C.

40

Nights . . . in the Sick Room

ANXIOUS hours are the night hours in the sick room. Hours of patient watching and of vigilance.

At such a time nothing can be so companionable as a restful, steady light. But it should be a light that needs no tending: a soft light that has no glare.

Such a light—large or small, according to the variety chosen—may be secured by the use of

price's Night Lights

ROYAL CASTLE or CHILDS'
For Small Light

PALMITINE STAR
For Medium Light

93 Awards.

CLARKE'S PYRAMIDS
For Large Light and Heat.

From a health point of view, Price's Night Lights have everything to commend them. They do not vitiate the atmosphere. They are clean to handle and to use, whilst their light has just that unobtrusiveness so essential in the illumination of sick room and nursery.

Sold Everywhere.

Anæsthetics—The Anæsthetists at the Sheffield Royal Infirmary and the Sheffield Royal Hospital.

Hospital Practice (Medical and Surgical) at the Sheffield Royal Infirmary (326 beds) and the Sheffield Royal Hospital (191 beds). Large Out-Patient Departments and Special Departments for Diseases of the Eye, Skin, Ear, Nose and Throat.

Clinical Gynæcology and Obstetrics at the Jessop Hospital for Women (80 beds). Extensive In-door and Out-door Maternity Department.

Infectious Diseases—City Fever Hospitals (600 beds). **Mental Diseases**—South Yorkshire Asylum (1694 beds). **Diseases of Children**—Hospital for Sick Children (60 beds).

COMPOSITION FEE, £80, payable in three instalments, covers Lectures and Practical Classes except Pharmacy. In addition, for Hospital Practice, £49 17*s.* 6*d.*, payable in three instalments.

WOMEN STUDENTS.

Attention is particularly drawn to the facilities offered to Women, who are admitted on exactly the same terms as men. Special arrangements are made to meet their needs in certain departments—e.g., in the Anatomical Department Special Classes for Women Students only are taken by a Lady Tutor. All the Clinical Appointments at the Infirmary and Hospital are open to Women. Special Common Rooms at the University and the Hospitals are reserved for Women Students. The UNIVERSITY HOSTEL, Ashgate Road, is a Hall of Residence for Women. Particulars may be obtained from the Warden.

SCHOLARSHIPS.

An Entrance Scholarship of the value of about £130 is awarded annually in the Medical Department. Examination in June. Also Post-Graduate Scholarships. The Courses of Instruction for the D.P.H. are recognised by the Universities of Cambridge and London, and by the Royal College of Surgeons.

DENTAL DEPARTMENT.

Dental Surgery and Pathology—Vacant.
Dental Anatomy and Physiology—W. J. Law, L.D.S.
Dental Mechanics—H. James Morris, L.D.S.
Dental Materia Medica—P. S. Stokes, L.D.S.
Dental Metallurgy—F. K. Knowles, B.Met.; F. Ibbotson, B.Met., B.Sc.
Dental Histology—W. J. Law, L.D.S.

For other Subjects of Courses see General List above.

Dental Hospital Practice and Laboratory Instruction in Mechanical Dentistry (two years' course) at the Sheffield Royal Hospital.
Intending students should communicate with the Dean.

W. M. GIBBONS, Registrar.

Founded 1894. **THE INCORPORATED SOCIETY OF TRAINED MASSEUSES** *Incorporated 1900.*

Arrangements have been made for the following Examinations to be held in 1917:—

Massage—London and Manchester, Sept., Dec.; Dublin, Dec.
Medical Electricity—July, and Nov. (London, Manchester, and Dublin).
Swedish Remedial Exercises—July and Dec. (London).
Teachers' Certificate—October (London).

A Branch of the Society has been opened in Manchester, where Examinations are held and Lectures given.

The Society is approved by the Medical Profession, and its certificate-holders may not undertake cases without the permission of a registered practitioner. The Certificate of the Society is a qualification accepted by the Admiralty and the War Office, and over 1000 certificate-holders are working in Naval, Military, and Red Cross Hospitals, Convalescent Camps, &c.

For further information apply to the Secretary— 157, GREAT PORTLAND STREET, LONDON, W. *Telephone: MAYFAIR 4189.*

POST-GRADUATE COLLEGE, WEST LONDON HOSPITAL, Hammersmith-road, W.—For Prospectus apply the Dean.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL AND MIDWIFERY TRAINING SCHOOL, Marylebone, N.W.

MEDICAL STUDENTS and QUALIFIED PRACTITIONERS admitted to the Practice of this Hospital. Unusual opportunities are afforded of seeing Obstetrical Complications and Operative Midwifery about one-half of the total admissions being primiparous cases.

PUPILS TRAINED FOR MIDWIVES AND MONTHLY NURSES. On being found competent each pupil is awarded a certificate of efficiency.

SPECIAL PREPARATION FOR EXAMINATION FOR CENTRAL MIDWIVES BOARD.

VALE OF CLWYD SANATORIUM

This Sanatorium (opened 1901) is established for the Treatment of Tuberculosis as carried out by Dr. OTTO WALTHER of Nordrach. It is situated in the midst of a large area of park-land, at a height of 450 feet above the sea-level, on the western slopes of mountains rising to over 1800 feet, which protect it from North and East winds and provide many miles of carefully graduated uphill walks—similar in character and extent to those at Nordrach.

Small rainfall. Porous subsoil. Large amount of sunshine. Electric Lighting and Hot Water Radiators in each room.

The physician himself was a patient at Nordrach.

For particulars, apply to GEORGE A. CRACE-CALVERT, M.B., &c., Llanbedr Hall, Ruthin, North Wales.

Canvassing, either directly or indirectly, until after the first selection of candidates by the Committee, will disqualify the applicant by whom or on whose behalf such canvassing shall have been made

HERBERT REED, Secretary.

Education Department, 15, John street, Sunderland, June, 1917.

Durham County Council. — The

County Education Committee invite applications for the post of ASSISTANT SCHOOL MEDICAL OFFICER (woman), to act under the County Medical Officer, in connection with the inspection of children attending elementary schools, and such other duties as may from time to time be required by the Education Committee.

The salary will be £300 per annum, rising by annual increments of £25 to £350 per annum (in addition to a war bonus at the rate of £25 per annum), together with reasonable travelling and out-of-pocket expenses. The successful candidate will be required to devote her whole time to the duties of her office, and to reside in or near the district to which she may be attached, at a place to be approved by the County Education Committee.

In making the appointment preference will be given to the candidate who has

(1) Enjoyed special opportunities for the study of the diseases in children.
(2) Had some definite experience in school hygiene; and
(3) Had adequate training in State Medicine, or holds a diploma in Public Health.

The appointment will be subject to three calendar months' notice on either side, to expire on the last day of any calendar month. ASTHMA,

CHRONIC BRONCHITIS, BRONCHITIS, ASTHMA, HAY FEVER, and INFLUENZA.

This remedy is made by passing thick bibulous paper through a Solution of Nitrate of Potash, Chlorate of Potash, and other Chemicals.

DIRECTIONS.—Fold and place one or two pieces of paper on a dish and light the top as illustrated. A dense fume will then arise and gradually fill the room; and after inhaling it for a few minutes the air tubes will be cleared of mucus, the difficult respiration will cease, and the patient will fall into a sound and refreshing sleep. The outer air must be excluded by keeping the windows, doors, and chimney closed. The paper may be burned in the day as well as at night if necessary.

Price 2s. 9d., 4s. 6d., and 11s. per box.

Dr. Thorowgood, Physician of the City of London Hospital for Diseases of the Chest, in his "Notes on Asthma," page 62, says:—"The Ozone Paper prepared by Mr. Huggins contains nitrate of potash, chlorate of potash, and iodide of potassium, and of its efficacy I have had abundant evidence." Dr. Woodward, Worcester:—"Your Ozone Papers have given me more permanent benefit than any other remedy I have tried I have also found the same with regard to my Asthmatic patients."

Usual discount to the Profession and Trade.

JUST ISSUED PAPERS OF 1916

COLLECTED PAPERS BY THE STAFF OF ST. MARY'S HOSPITAL

JUST ISSUED PAPERS OF 1916

MAYO CLINIC

Some of the Contents

Some of the more important subjects are: Radium treatment, roentgen diagnosis, surgery of tonsils, syphilis and tuberculosis of the stomach, cancer of rectum, diverticula of bladder, cancer of the uterus, diagnosis and treatment of mammary conditions, surgery of thyroid, splenectomy, heart-block, transfusion in pernicious anemia, trifacial neuralgia, thoracic diseases and surgery, etiology of epidemic poliomyelitis, hospital problems of gonorrhea and syphilis, dental research.

"It is only necessary for us once more to express our admiration of the work done by the Staff of St. Mary's Hospital, and to welcome this valuable contribution to the literature of surgery."—EDINBURGH MEDICAL JOURNAL.

"No surgeon or physician could find a more suggestive or useful compilation."
MEDICAL PRESS AND CIRCULAR.

"It is a great advantage to those who have not the time or means to journey as far as Rochester in order to visit the Mayo Clinic to have an account of the advances in surgical technique produced at this hospital brought within their reach in this way."—THE MEDICAL TIMES.

Octavo of 1015 pages, illustrated. By WILLIAM J. MAYO, M.D., CHARLES H. MAYO, M.D., and their ASSOCIATES at The Mayo Clinic, Rochester, Minn. Cloth, 28s. net

Cullen's Diseases of the Umbilicus

SUPERB ILLUSTRATIONS

Dr. Cullen's new work contains chapters on embryology, anatomy, infections in the new-born, hæmo rhage, granulation tissue at the umbilicus, umbilical polypi, gastric mucosa at the umbilicus, Meckel's diverticulum, intestinal cysts, patent omphalomesenteric duct, prolapsus of the bowel, concretions, abscess, Paget's disease, diphtheria, syphilis, tubercu'osis, atrophy, fæcal fistula, hypertrophy, angioma, lymphocele, connective-tissue growths, dermoids, sweat-glands, abdominal myomata, papilloma, adenomyoma, cancer, sarcoma, hernia, exstrophy of the bladder, urachus and its diseases, acquired urinary fistula, &c., &c.

The DUBLIN JOURNAL OF MEDICAL SCIENCE says: "*We know no monogram on the subject so full, so informative, so exhaustive, or so valuable.*"

Octavo of 775 pages, with 269 illustrations. By THOMAS S. CULLEN, M.B., Assistant Professor of Gynæcology, Johns Hopkins University. Cloth, 35s. net.

Owen's Treatment of Emergencies

JUST READY

Dr. Owen's book gives not only the *actual technic* of the procedures, but the underlying principles and the reason *why* a particular method is advised. Especially strong is the chapter on *gunshot wounds*, which gives the new treatments that the great war has developed. The *ambrine treatment* of burns is given and illustrated.

12mo of 350 pages, with 249 illustrations. By HUBLEY R. OWEN, M.D., Surgeon to the Philadelphia General Hospital. Cloth, 8s. 6d. net.

Elsberg's Surgery of the Spinal Cord.

This book gives in clear definite language the diagnosis and treatment of all surgical diseases of the spinal cord and its meninges, illustrating each operation with original pictures. It goes thoroughly into symptomatology, diagnosis, and indications for operation and actual technic.

Large octavo of 330 pages, with 158 illustrations, 3 in colors. By CHARLES A. ELSBERG, M.D., Professor of Clinical Surgery, New York University and Bellevue Hospital Medical School. Cloth, 21s. net.

Books sent, Carriage Paid, on Receipt of Price.

W. B. SAUNDERS COMPANY, 9, Henrietta Street, London, W.C. 2.

Lancet.—"**We have nothing but praise for this Annual.**"

Thirty-fifth Year. Fully illustrated in Colours, and Black and White. **NOW READY. 10/- *net.***

MEDICAL ANNUAL, 1917

Arranged in Alphabetical order for Easy Consultation.

Contributors:

E. WYLLYS ANDREWS, A.M., M.D., Chicago; JOSEPH G. BLOMFIELD, B.A., M.D.; FRANCIS D. BOYD, C.M.G., M.D., F.R.C.P.; FRANCIS J. CHARTERIS, M.B., B.Ch.; JOHN D. COMRIE, M.A., M.D., F.R.C.P.; LEWIS A. CONNER, Ph.B., M.D., New York; CAREY F. COOMBS, M.D., F.R.C.P.; W. H. DOLAMORE, M.R.C.S., L.R.C.P., L.D.S.R.C.S.; JOHN S. FRASER, M.B., Ch.B., F.R.C.S.; W. E. FOTHERGILL, M.A., M.D.; DAVID McV. FLECK, M.B., Ch.B.; HERBERT FRENCH, M.A., M.D. F.R.C.P.; EDWARD W. GOODALL, M.D., B.S.; C. THURSTAN HOLLAND, M.R.C.S. L.R.C.P.; J. RAMSAY HUNT, M.D., New York; ROBERT HUTCHISON, M.D., F.R.C.P.; FREDERICK LANGMEAD, M.D., F.R.C.P.; E. G. GRAHAM LITTLE, M.D., F.R.C.P.; CHARLES FRED. MARSHALL, M.D., F.R.C.S.; BEDFORD PIERCE, M.D., F.R.C.P.; JOSEPH PRIESTLEY, B.A., M.D., D.P.H.; SIR LEONARD ROGERS, Lt.-Col. I.M.S., M.D., F.R.C.S., F.R.C.P., Calcutta; A. HUGH THOMPSON, M.A., M.D.; J. W. THOMSON WALKER, F.R.C.S.; W. I. DE COURCY WHEELER, B.A., M.D., F.R.C.S.; A. GASCOIGNE WILDEY, Dep. Surg.-Gen. R.N.; MARGUERITE WILSON, M.B., CH.B., Glasgow.

This year's volume has a unique value. It is a faithful digest of current Medical and Surgical thought, and hence is coloured of necessity by the War. But War problems will confront the Practitioner on every hand, and he must be prepared to deal with them. Such a digest cannot be obtained elsewhere.

UNIFORM IN SIZE WITH THE "MEDICAL ANNUAL." **8/6** *net.*

"A FIRST-RATE ACQUISITION FOR EVERY PRACTITIONER."

THE MEDICAL ANNUAL SYNOPTICAL INDEX

TO REMEDIES AND DISEASES for the Ten Years 1905 to 1914:
together with a Dose Index in Imperial and Metric measures in accordance with the British Pharmacopœia, 1914, and indicating the alterations that have been made.

Subscribers now serving abroad can have a copy reserved on sending a post card to the Publishers. Payment and delivery can await their return if desired. As this work, in addition to its own valuable information, renders every fact contained in the ten volumes of the Annual immediately available for reference, the Publishers will gladly reserve the remaining copies for Subscribers to the Annual who possess the volumes to which it refers.

OPINIONS REGARDING THE PRECEDING VOLUMES.

Reading. "I desire to congratulate you . . . of the greatest use to all busy practitioners, and to those wishing to refer to details of methods of treatment."
Glasgow. "I am delighted with this book: medical men must find it a treasure." *Guildford.* "Will be of the greatest possible use, and is most capitally done."
"It is by no means necessary that the reader should possess all the numbers to render this volume of use—it is a work in itself, and contains a vast amount of information."—*Lancet.*
"A perfect gem of an index, with cross references. The multitude of facts compressed into the small compass of its four hundred pages makes the book one of permanent value."—*Medical Press and Circular.*

BRISTOL: JOHN WRIGHT & SONS LTD. London: Simpkin, Marshall & Co. Ltd.

RELIABLE LIGATURES.

In ligature and suture material there can be nothing better conceived for the sterile and aseptic preparation and conveyance of the same, than a hermetically sealed glass tube. Catgut or silk, as it is prepared in our laboratories must reach the surgeons' hands in absolutely sterile condition.

This is our positive guarantee.

BREAKABLE TUBES.

These Tubes possess advantages known to no other tubes. The perfection of Johnson & Johnson's Laboratory preparation of Ligature and suture material cannot be obtained elsewhere.

Fighting the Fly: Saving the Baby

THE British Commercial Gas Association, a co-operative advisory and research body representing the chief gas undertakings of the United Kingdom, both company and municipal, has recently brought out a special number of its monthly illustrated publication

"A THOUSAND AND ONE USES FOR GAS"

which deals with the important subject of refuse destruction and the campaign against the fly peril.

Another pamphlet, produced in connection with the National Baby Week Campaign and entitled

"SAFEGUARDING THE BABIES,"

deals with the hygiene of modern lighting, cooking, heating, and water-heating in nurseries both private and communal.

All readers of this paper who are interested in these vital questions of public health are invited to apply for free copies to

The Secretary, The British Commercial Gas Association, 47, Victoria Street, Westminster, S.W. 1.

THE SINGER "10"

AN IDEAL DOCTOR'S CAR

A FEW OF THE FAMOUS **SINGER "10's"** ARE NOW AVAILABLE FOR IMMEDIATE DELIVERY TO THOSE ABLE TO OBTAIN PERMITS FROM THE MINISTRY OF MUNITIONS.

PRECEDENCE IS USUALLY GIVEN TO DOCTORS.

If would-be Purchasers so desire, we will supply them with the necessary form of application.

Write to-day for full particulars—

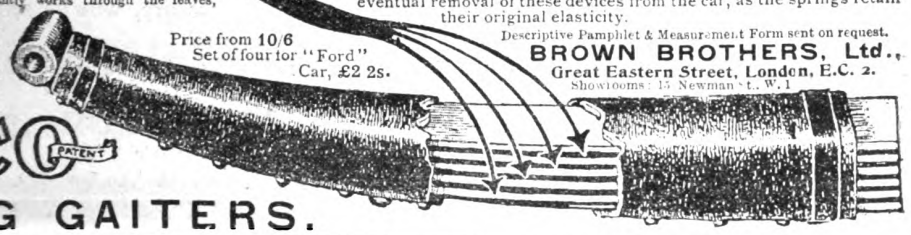
SINGER & CO., LTD., COVENTRY.

A film of grease between each leaf

DUCO Gaiters protect the springs from dust, mud and water, at the same time maintaining a constant supply of lubricant.

As the springs alternately compress and rebound, the grease in the gaiters constantly works through the leaves, giving the car a fine silky movement, allowing it to ride much more easily.

Suitable for all types of springs. Once fitted, need not be removed, but simply replenished with grease from time to time.



The springs of a Car usually work for the first few weeks after leaving the manufacturers' hands, but from this period onwards, with washing and the accumulating of mud and dust, the springs get less efficient every day, until eventually they are nothing but a mass of rusted steel.

To overcome this, subsidiary springs or "shockabsorbers" are added with varying results. The fitting of the DUCO Spring Gaiter means the eventual removal of these devices from the car, as the springs retain their original elasticity.

Price from 10/6
Set of four for "Ford" Car, £2 2s.

Descriptive Pamphlet & Measurement Form sent on request.

1867 HAYDEN'S HVC VIBURNUM COMPOUND 1917

In 1867 HAYDEN'S VIRBURNUM COMPOUND was first introduced, and for fifty years it has enjoyed an ever-increasing demand, due to the confidence accorded it by the medical profession for its therapeutic dependability in Gynecological and Obstetrical conditions.

It gains and retains confidence by the results it manifests therapeutically, the only convincing test of the value of a medicinal remedy and upon this basis we invite your consideration.

Accord Hayden's Viburnum Compound a trial in your next Dysmenorrheal patient, and *you will be convinced. Dose*: One or two teaspoonfuls three times a day or as required. Administer in three or six teaspoonfuls of hot water.

A supply of the genuine H. V. C., with literature, will be sent you on request.

Gastro-Intestinal Disorders

Angier's Emulsion is particularly efficacious in gastro-intestinal disorders of a catarrhal, fermentative, ulcerative, or tubercular nature. Petroleum undergoes no chemical change in the stomach, hence it exercises its sedative, demulcent, lubricant effects throughout the entire intestinal canal from the duodenum to the rectum, and is therefore of value whether the inflammation be seated in the large or small intestine. Treatment of intestinal diseases with Angier's Emulsion is efficient, because it makes possible the direct local application of a soothing agent to the inflamed areas which are beyond the reach of other remedies. Either alone or as a vehicle for the administration of intestinal antiseptics or astringents, Angier's Emulsion is invaluable in the treatment of enteritis, gastro-intestinal catarrh, dysentery, infantile diarrhœa, and enteric fever.

ANGIER'S EMULSION

PETROLEUM WITH HYPOPHOSPHITES

DEAR SIRS,—I advocate strongly the employment of Angier's Emulsion in all cases of flatulent dyspepsia; of intestinal indigestion accompanied by auto-intoxication produced by the decomposition of ill-digested food and the consequent formation of toxins; and of mucous colitis. I have seen in my own private practice, and as a consultant, cases in which this excellent emulsion proved itself to be *the* remedy. (Signed) ——, M.D. Edin., &c.

"In those chronic cases of irritation of the large bowel accompanying non-inflammatory adhesions, in which conditions one meets with tenderness, pain, and a continuous process of auto-intoxication, in my opinion no substance taken internally is more valuable than liquid paraffin for mechanically maintaining the activity of the bowel and so relieving the patient of the above-mentioned symptoms. After long experience of many forms of paraffin and petroleum both in character of emulsions and otherwise, I have found none so satisfactory to the patient as Angier's Petroleum Emulsion." ——, M.B., D.Sc., M A.

Sanaphos

T. M. Reg.

For all Disorders of Nutrition and Nerves

NUTRITION needed for nerves in Neurasthenia and Nervous Debility in these nerve-wearing and distracting times is amply supplied by SANAPHOS, which is not a one-constituent food but is replete in tissue-repairing and energy-giving constituents.

These are supported by the phospho-nucleins and other organic phosphorus compounds, enzymes, and vitamin, which ensure assimilation and repair, restoring to the organism, tone, nerve fitness, and vigour.

SANAPHOS has an attractive milk-like flavour and is soluble. Patients take it readily, and it has given most valuable results in all debilitated conditions, restlessness, insomnia, and helps in a very striking way in bringing those weakened by illness back to strength.

SANAPHOS is and always has been wholly British.

SANAPHOS is procurable at fixed prices from all Chemists and Stores throughout the world.

An Urgent Call to Save the Babies!

The present loss of Infant life—at a moment when these little lives are more precious than ever—is a matter of grave concern to the nation. Each year 100,000 infants perish in the United Kingdom. This appalling mortality is largely due to contaminated milk and improper feeding.

The child's birthright is its mother's milk, but where that is absent, small in quantity, or of poor quality, the best—the only—alternative is Nestlé's Milk.

NESTLÉ'S MILK

is *pure* milk—the best and richest full-cream—abounding in just the nutriment that baby needs—that will build up bone and tissue and make the little one strong and sturdy.

Thousands of the gallant men now fighting for King and Country owe much of their strength and vigour to the Nestlé's Milk on which they were reared in babyhood—need more be said?

The Proprietors of Nestlé's Milk have published, under the title of **"Heroes All,"** a magnificent Album of Portraits of over 200 of these men, together with the testimony of their parents. This book will carry the final word of conviction, and we want every Medical Man in the Kingdom to see it. A complimentary copy sent post free on application to

NESTLÉS, 6-8 EASTCHEAP, LONDON, E.C. 3.

CLINICAL PATHOLOGY AND RESEARCH

The Staff of the Virol Research Laboratories, which are under the control of a Medical Superintendent, consists entirely of qualified members of the medical profession with special experience in their own departments; every specimen submitted is examined and the report thereon signed by the actual investigator. The work is done exclusively for the medical profession, and in no case is any information given to the patient.

The buildings are structurally exceptionally well equipped and are open to inspection at any time during working hours by qualified members of the medical profession, who are also invited to make use of the library and reading room. Demonstrations of pathological methods are given from time to time by the Medical Superintendent.

The scale of fees has been designed to afford to the Medical Practitioner laboratory facilities for every class of patient.

A price list will be sent on application. Specimen charges are as follows:—

SYPHILIS:	Detection of spirochæta pallida in scrapings from the primary lesion by the ultra-microscope and stained films	**5/3**
	Wasserman Reaction on the blood	**5/3**
GONORRHŒA:	Detection of the organism in pus	**2/9**
DIPHTHERIA:	Microscopical and cultural examination of swab	**1/3**
TUBERCLE:	Examination of sputum for T.B.	**1/3**
AGGLUTINATION TEST	for typhoid, paratyphoid, &c. ...	**2/3**
BLOOD:	Examination of spread films with differential count of leucocytes	**7/9**
TUMOURS, &c.:	Report with mounted paraffin section ...	**6/3**
URINE:	Simple qualitative examination with microscopical examination of centrifugalized deposit	**4/9**
AUTOGENOUS VACCINE	with twelve graduated doses ...	**21/3**

An Ideal Antiseptic

of wide applicability in the treatment of infected wounds and in surgical practice.

CHLORAMINE-T

p-toluene-sodium-sulphochloramide.

Introduced by Dr. H. D. Dakin and his colleagues of the Leeds University.

The use of the Hypochlorite antiseptics marks a new era in treatment. The new product—CHLORAMINE-T—is a great advance on the solutions containing Hypochlorous Acid which are now so widely used. It is practically non-toxic, does not coagulate blood serum, and is stable both in powder and solution. It may be employed not only for the treatment of wounds, but also as a mouth wash, nasal or vaginal douche, and for urethral irrigation.

Supplied in Powder in 1oz. bottles 1/2; 4oz. 3/6; 1lb. 12/6. Also in Tablets—8·75 grs.—bottles of 25, 1/4; 50, 2/6; 100, 4/6. Tablets—43·75 grs.—bottles of 12, 2/8; for making solutions of known strength. All post free.

Chloramine-T Gauze

containing approximately 5% Chloramine-T is also prepared. It is a non-toxic and non-irritating antiseptic gauze, and should be used dry, and subsequently moistened (if necessary) when in position.

Supplied in Rolls, 1/- each, post free.

May be ordered from any of the 555 branches of Boots *The* Chemists or direct from Headquarters.

Manufactured in the Laboratories of

BOOTS PURE DRUG CO. LTD.,

STATION STREET, NOTTINGHAM.

Prescribed by the Medical Profession for 35 years.

The MEDICAL PRESS & CIRCULAR (London, Eng.) says:
"Few modern improvements in pharmacy have done so much as Benger's Preparations to assist the physician in his treatment of the sick."

"AN OUTSTANDING FOOD."

Everywhere Benger's is the Food relied upon by the British medical profession, in the prostration of illness, after severe operations, and in cases of difficult feeding.

Benger's is the One Food which contains the active enzymes of natural digestion (the amylolytic and tryptic ferments), and because of these, *it is the One Food* which is self-digestive to any extent the physician may prescribe.

It is a safe food to give in sickness and in severe digestive derangement, and is usually retained when all other foods are rejected.

BENGER'S FOOD (which is to be prepared with fresh new milk) is enjoyed by invalids who are unable to assimilate milk alone or milk and water.

BENGER'S
Food

for INFANTS, INVALIDS, AND THE AGED,

is sold throughout the World by Chemists, &c., in sealed tins, price 1/-, 1/6, 2/6, 5/-, and 10/-.

A physician's sample, with full particulars, will be sent post free on application to any member of the medical profession.

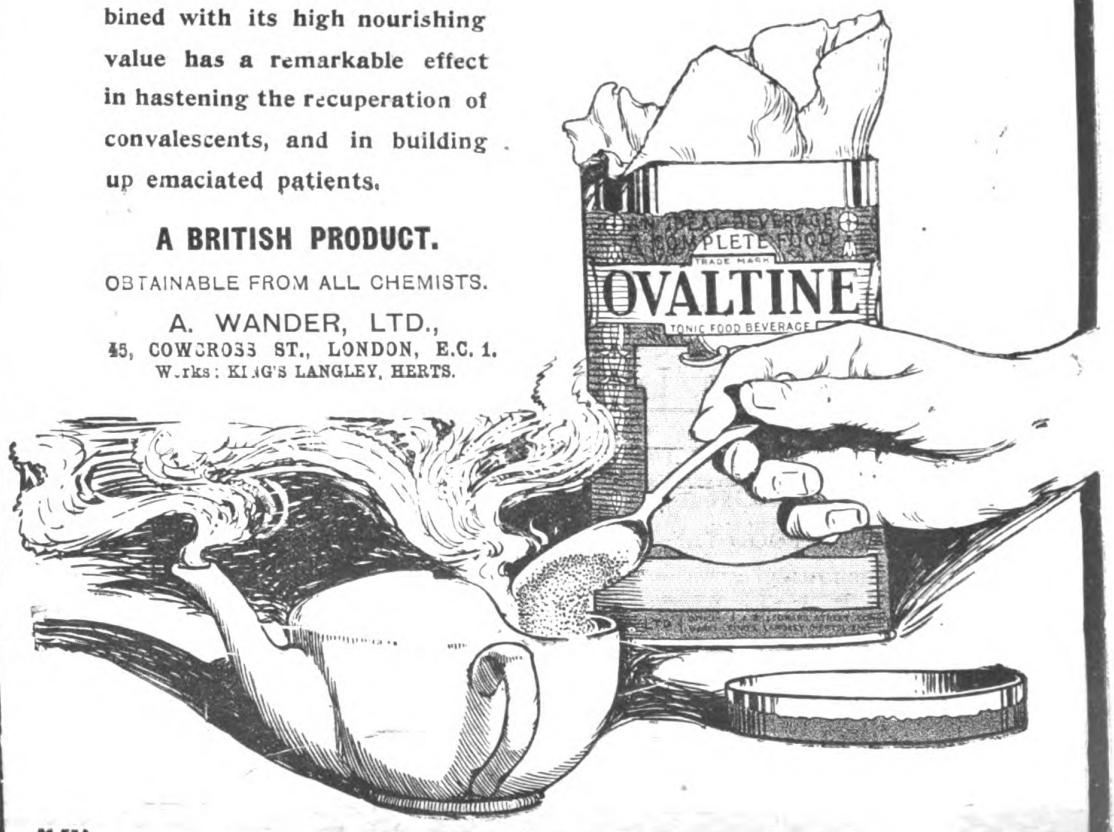
N.B.—BENGER'S FOOD is the direct outcome of the pioneer work on digestive ferments by the late Sir William Roberts, M.D., F.R.S. and the late Mr. F. Baden Benger F.I.C., F.C.S. in 1880, since when it has been the premier dietetic preparation of its kind in the British Empire.

M 80a

OVALTINE

TONIC FOOD BEVERAGE

IN THE SICK ROOM.



The ease of preparation of "Ovaltine" is an obvious advantage. The granules on being dropped into hot milk dissolve in a few seconds. Troublesome and tedious cooking processes are thus avoided.

A cup of "Ovaltine" contains as much nourishment as three eggs, and is digested and absorbed with the minimum of strain to the digestive functions. Its flavour is always acceptable even to the most fastidious and during prolonged courses. "Ovaltine" is distinguished from ordinary invalid foods in being unusually rich in organic phosphorus compounds. This combined with its high nourishing value has a remarkable effect in hastening the recuperation of convalescents, and in building up emaciated patients.

A BRITISH PRODUCT.

OBTAINABLE FROM ALL CHEMISTS.

A. WANDER, LTD.,

SOLE AGENT FOR GREAT BRITAIN, THOS. CHRISTY & CO., 4, 10 & 12 OLD SWAN LANE LONDON E.C.

Prophylactic Vaccines

The undermentioned Vaccines are prepared in the Vaccine Laboratory of St. Mary's Hospital, London (Director: Sir A. E. Wright, M.D., &c.), and are supplied to the Medical Profession through the agency of PARKE, DAVIS & Co.

ANTI-CHOLERA VACCINE

(Prophylactic)

Prepared from cultures of the cholera vibrio from material recently obtained on the Continent.

ANTI-MENINGOCOCCUS VACCINE

(Prophylactic)

Prepared from several strains of the Diplococcus intracellularis meningitidis (Weichselbaum) isolated from cases of epidemic cerebro-spinal meningitis.

N.B.—MENINGOCOCCUS VACCINE FOR TREATMENT is also supplied.

ANTI-PARATYPHOID VACCINE

(Prophylactic)

Prepared from cultures of the Bacillus paratyphosus (*A* and *B* in equal proportions).

N.B.—Ten-fold dilutions of this Vaccine can be used in the treatment of paratyphoid infections.

ANTI-TYPHOID VACCINE

(Prophylactic)

Prepared from cultures of the Bacillus typhosus.

N.B.—TYPHOID VACCINE FOR TREATMENT is also supplied.

ANTI-TYPHOID-PARATYPHOID VACCINE (T.A.B.) (Prophylactic)

Prepared from cultures of Bacillus typhosus, B. paratyphosus *A*, and B. paratyphosus *B*. For use in cases in which it is desired to administer a mixed prophylactic vaccine.

N.B.—This Vaccine has largely supplanted Anti-Typhoid Vaccine, and is of the same formula as that which is being issued to the Army.

ANTI-TYPHOID-PARATYPHOID CHOLERA VACCINE (Prophylactic)

A mixture of the three vaccines. For use when time does not allow of administering each vaccine separately.

Each of the above-mentioned Vaccines is supplied in sets of two bulbs (as required for the protective inoculation of one adult) at 5s. 6d. per set, also in bottles of 25 c.c. (sufficient for sixteen adults) at 27s. 9d. per bottle.

ANTI-CATARRH VACCINE

(Prophylactic)

For use where it is not convenient to employ an autogenous vaccine. Prepared from cultures of B. pneumoniæ (Friedländer), Pneumococcus, Staphylococcus, M. Catarrhalis, B. septus (diphtheroid), B. Influenzæ, and Parodontal Streptococcus.

ANTI-GANGRENE VACCINE

(Prophylactic)

Prepared from cultures of organisms obtained from various wounds Contains B. aerogenes capsulatus (B. perfringens, B. Welchii), Staphylococcus, Streptococcus fæcalis, and S. pyogenes.

For use in cases of severe wounds, to prevent the occurrence of gangrene, septicæmia, erysipelas, &c.

Anti-catarrh Vaccine and Anti-gangrene Vaccine are supplied in bulbs of about 1 c.c. and in bottles of 25 c.c.

Sole Agents for the sale of the above-mentioned Vaccines:

PARKE, DAVIS & Co., 50-54, Beak St., Regent Street, LONDON, W.

Telegraphic Address: "CASCARA, LONDON." **Telephone No.: REGENT 3260 (six lines).**

Advances in Treatment

Intramuscular Injections in Syphilis

The most convenient and accurate method of administering intramuscular injections is by means of the "Hyposol" Ampoule-Syringe, which contains the dose of semi-fluid cream in the barrel and by a simple adaptation is made ready for use. Special intramuscular needles are supplied with the doses.

"Hyposol" Ampoule-Syringe charged with Salvarsan Cream ready for use.

"Hyposol" Trade Mark **Salvarsan,** doses of 0.1, 0.2, 0.3, 0.4, 0.5 or 0.6

"Hyposol" Trade Mark **Novarsenobenzol,** doses of 0.15, 0.3, 0.45, 0.6, 0.75 or 0.9.

"Hyposol" Trade Mark **Mercurial Cream,** 1 grain of Mercury in each.

"Hyposol' Trade Mark **Calomel,** doses of $\frac{1}{6}$, $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$ or 1 grain.

A booklet entitled "Hypodermic Medication," with a list of solutions supplied in "Hyposol" and "Azoule" form, will be sent post free on application.

Allen & Hanburys Ltd., London.

City House: 37 Lombard St., E.C.3. *West End House:* 7 Vere St., Cavendish Sq., W.1.

For Invalids, Dyspeptics and the Aged.

'Allenburys' The DIET

Invaluable in Sickness and Convalescence.

TITLE IMPORTANT

The "Allenburys" DIET is a complete food chiefly intended for Adults, and is *quite distinct* from the "Allenburys" Foods for Infants. It is quickly prepared, exceptionally palatable, easily digested and wholly nourishing.

COMPOSITION & PREPARATION

The "Allenburys" DIET is made from pure, rich, full-cream milk and whole wheat, both ingredients being partially pancreatised during the process of manufacture. It needs boiling water only to prepare it for use.

ANALYSIS

Fat	15·4
Proteid	15·2
Soluble Carbohydrate ...	47·2
Starch	15·7
Mineral Matter	4·3
Moisture	2·2

Caloric Value of the "Allenburys" DIET when prepared ready for use:

Fat	23·8
Proteid	10·4
Carbohydrate	42·9

INDICATIONS FOR USE

In all Gastric conditions where it is found that curd is not digested, Gastritis, Gastro-Enteritis, Gastric Catarrh, Gastric Ulcer, Gastric Influenza, Obstinate Vomiting. In all Acute Disorders. Before and after Surgical Operations. In Convalescence, Gouty Dyspepsia, Insomnia, (taken last thing at night it promotes refreshing sleep and digestive rest). Neurasthenia. All forms of Tuberculosis. In Senile Disorders of the Digestion. When pure milk is not obtainable, viz., on Board Ship, in Tropical Countries or Distant Lands, or whenever a light nourishment is required. For the Invalid, Dyspeptic, and the Aged it is an essential nutrient.

ADVANTAGES

Most invalids' foods require cow's milk to be used in their preparation; this involves much time and careful mixing to avoid the presence of burnt milk or lumpiness—common characteristics of foods so prepared. The "Allenburys" DIET does not require cow's milk to be added. By the simple addition of boiling water a complete food is produced that is smooth to the palate and pleasant to the taste. The "Allenburys" DIET can be taken for prolonged periods without any distaste arising. These distinct advantages are of immense service in the work of a busy hospital or understaffed sick-room.

MANUFACTURED BY

Allen & Hanburys Ltd., Lombard St., London.

Prices: In sealed tins 1/9 and 3/6 each.

"YADIL" ANTISEPTIC

(Tri-methenal allylic carbide compound) enables the Medical Profession to obtain

Complete Internal and External Antisepsis.

NON-TOXIC. NON-CAUSTIC. NON-IRRITANT. Contains neither copper, mercury, arsenic, iodine, ether, alcohol, phenol nor cresol. Does not coagulate albumen. Will not harm the most delicate tissue. Does not modify hæmoglobin. Increases the activity of the phagocytes. Is intensely diffusive and possesses considerable cell-proliferant properties. Does not stain nor deteriorate. Fully miscible with water. Powerful deodoriser. Non-flammable. Can be used freely for both internal and external antisepsis.

THE SUCCESS OF "YADIL" ANTISEPTIC

in the treatment of infectious diseases is due to the following facts: Although bactericidally equal to pure phenol, it can be administered internally in dosage of 30 times (and more) that of phenol, without the slightest risk to the most delicate tissue or disturbance to the digestive organs. Owing to its diffusive powers, "YADIL" permeates the body fluids and is excreted largely by the lungs and skin, and in passing through the tissues it destroys germs and their spores. Hence the brilliant results obtained in all diseases of micro-organic origin, such as:—

All Fevers—Diarrhœa—Dysentery—Gastric Ulceration—Acute Bronchitis—Enteritis—Incipient Tuberculosis—Skin Diseases—Abscesses—Syphilitic Ulcers and Sores—Rodent Ulcers—Gonorrhœa (especially female cases), &c.

For the treatment of Septic Wounds nothing equals "YADIL." Wounds which had been suppurating for months have been healed in 8 to 10 days and new tissue formed in a remarkably short time.

As a febrifuge, "YADIL" is superior to quinine. Temperature reduced in 24 to 36 hours.

"YADIL" is a British discovery throughout, and not the usual adaptation of German antiseptics.

No Free Samples.—The success of "YADIL" has been established in Hospital and Medical Practice. Owing to scarcity of supplies, we regret being unable to distribute free samples.

CONCENTRATED FORM:—

Sizes	2 oz.	6 oz.	20 oz.	40 oz.
Retail Prices	**1/6**	**3/-**	**8/9**	**16/-**

"YADIL" makes from 1 to 2 gallons of dilute solution per oz. for the treatment of Wounds, Sores, Abscesses, &c.

Obtainable from usual sources of supply, or direct from us. Orders from abroad should be placed through London buyers or Shippers. Literature sent to Doctors on request by the SOLE PROPRIETORS and MANUFACTURERS—

CLEMENT & JOHNSON, 19, Sicilian Avenue, London, W.C.1.

Telegrams: "CLEMALEXA, LONDON." Telephone: CITY 4373.

The word "YADIL" has been registered as a Trade Mark.

Carnrick's Liquid Peptonoids

BEEF, MILK, and WHEAT (Pre-digested).

A Sustaining, Stimulating, and Palatable auxiliary food, rich in all the nutritive principles of Beef and Wheat (except the fat) pre-digested by Pepsin and Pancreatin; ready for immediate absorption and assimilation, especially useful for the restorative feeding of patients unable to digest food in any other form.

INDICATIONS.—In crises and exhaustion; all cases of gastro-intestinal disease; pneumonia; and as a colonic nutrient.

Of "Liquid Peptonoids" THE LANCET writes:—"A very valuable food .... a very powerful and agreeable tonic and stimulant."

THE HOSPITAL:—"Its most valuable feature is that clinically it has proved itself capable of absorption when everything else has been rejected by the stomach."

THE BRITISH MEDICAL JOURNAL:—"Readily taken and well borne, even by a very delicate stomach."

DOSE.—One or two tablespoonfuls four to six times a day.

A paper on colonic alimentation, giving the latest methods and formulæ, will be forwarded on application to the Company. To ensure a correct supply to patients, Physicians are respectfully requested to specify this preparation in writing.

CARNRICK & CO., Limited, 183, Acton Vale, London, W. 3.,

Will be pleased to send Samples Free of Charge to Medical Men.

"MALTINE" WITH IRON.

Each fluid ounce contains— Iron Pyrophosphate ... ... 8 grains.

This is a particularly bland and assimilable preparation of Iron, in which the astringency of the ferruginous salt is counteracted by the laxative action of the "MALTINE" base.

The word "MALTINE" is our Trade Mark.

In prescribing kindly specify "MALTINE COMPANY."

THE MALTINE MANUFACTURING CO., LTD.,

183, ACTON VALE, LONDON, W. 3,

Will be pleased to send Samples Free of Charge to Medical Men.

ALL REACTIONS of the body fluids and tissues are COLLOIDAL.

Before a drug can exert its full therapeutic action it is necessary for it to become converted into the colloidal state (Dr. ——, in the BRITISH MEDICAL JOURNAL, 19th May, 1917).

CROOKES'

COLLOSOLS are Drugs in the Colloid State.

COLLOSOLS are isotonic and isomorphic with the elements of the body.

COLLOSOL ARGENTUM

is a perfectly stable colloidal solution of Silver, constituting a non-toxic and non-irritant antiseptic for general practice, which is entirely harmless to the host.

It is specially indicated in superficial bacterial infections such as **Gonorrhœa, Cystitis, Infective Wounds,** and diseases of the **Eye, Ear,** and **Mouth.** It is also specific in **Gonorrhœal Rheumatism** by subcutaneous injection. Also by internal administration in **Dysentery** and other intestinal affections.

COLLOSOL ARGENTUM is prepared in AQUEOUS SOLUTION in 1½-oz., 4-oz., and 8-oz. bottles, or in ampoules, also as a PASTA in glyco-gelatin base, or as an OINTMENT, and is also supplied as SUPPOSITORIES, PESSARIES, BOUGIES, and OVULES.

Full particulars of COLLOSOL ARGENTUM, as also of COLLOSOL MERCURY, COLLOSOL IODINE, COLLOSOL SULPHUR, and COLLOSOL COCAINE supplied on application.

COLLOSOLS are prepared for the Proprietors, Crooke's Collosols Ltd., at

THE CROOKES' LABORATORIES,

50, Elgin Crescent, LONDON, W. 11.

Battle scene reproduced from ancient Hindu-Javanese bas-reliefs in Java. The warriors fight with bows and arrows and with swords and daggers of various designs. Several are armed with weapons resembling the ancient Persian sword ending in a point beyond the broadening of the blade, the effect of which was to add force to the cut. The oblong, convex shields were made of wood and leather with a strap or lath of wood through which to pass the hand. The rank and file wear close-fitting caps probably of linen, while the officers wear cone-shaped head-dresses over their tressed and piled-up hair. The warriors over whom are held umbrellas are personages of high rank. Date, A.D. 650-800.

PROTOZOOLOGISTS.

Report to the Medical Research Committee from the Military Dysentery Convalescent Hospital, Barton-on-Sea, Lieut.-Col. J. Chaytor White, I.M.S., Commanding.

(With an Excerpt from Notes on 2000 Cases of POST-DYSENTERIC DIARRHŒA at the Military Dysentery Convalescent Hospital, Barton-on-Sea, by W. WADDELL.)

1. *Introduction.*

THE cases dealt with in this paper were discovered to be carriers of *Entamœba histolytica* in the course of the ordinary routine examinations of fæces at this convalescent hospital; none of them were found to be carriers of dysentery bacilli. They were all treated with emetine bismuthous iodide, and it has been thought worth while publishing the results, as this is the first time, so far as we know, that the drug has been tested on such a large scale. The treatment has had the advantage of being carried out under the supervision of one medical officer at a place where the necessary protozoological examinations could be made on the spot.

2. *Previous History of the Cases.*

All the cases came into the hospital as convalescents after dysentery, 52 direct from hospital ships, the remainder from home hospitals.

With 9 exceptions all the cases were invalided from the Eastern Mediterranean area (87 cases) or Mesopotamia (6 cases). The other 9 cases were invalided from France; of these, 5 had exhibited dysenteric symptoms previously in Egypt, and 2 in Gallipoli, while another (10*) contracted dysentery in India in the autumn of 1914, just before being sent to France with a division of Indian troops; of the remaining case from France (1787) we have no further details.

Two other cases (1082, 1684) had previously had dysentery in India in 1908 and 1914 respectively, but as one went subsequently to Gallipoli and the other to Salonika it cannot be said with certainty that they became infected with *Entamœba histolytica* in India. Two cases had formerly had dysenteric symptoms in South Africa, one (787) in 1909, the other (1881) during the Boer War, while a third (1540) had "dysentery or enteric" in the Boer War.

Three cases (899, 1197, 1483) reported having diarrhœa with blood and mucus in France for a few days in 1915 before going to Salonika or Gallipoli; but it is impossible to say whether it was of amœbic origin. Seven cases which had dysentery in Gallipoli afterwards went to Salonika, where they all relapsed.

One case (902) had no history of acute dysentery; he was invalided from Salonika to Malta with nephritis, and, while in hospital there, was found to be passing cysts of *E. histolytica*; there seems no doubt he was a "contact carrier."

There is no direct evidence that in all cases the acute phase of the disease was due to *Entamœba histolytica*; but since the majority of the cases have a history of more or less chronic or intermittent diarrhœa (even in England), with occasional relapses of an acute character, it may be presumed that in them this organism was the cause of the trouble.

A large number had been treated with emetine hypodermically, one or two having received as many as 100 injections. One case (1987) had been operated upon for liver abscess.

3. *Method of Treatment.*

The form of the drug used was a keratin-coated tabloid (prepared by Burroughs, Wellcome and Co.); each tabloid contained 1 grain of emetine bismuth iodide.

As a rule the daily dose, consisting of 3 grains, was given to each man after the mid-day meal. The time of giving the daily dose was decided by the men after trials of various hours; they were less disturbed by taking the dose at mid-day than at any other time, and objected strongly to its being given at night owing to night-calls to the latrine. After having their dose at 1 P.M., all lay down and rested; during the earlier part of the day they were allowed out within the lines, and, being put into blue, they were easily kept under observation.

The 102 cases were treated in various batches between Sept. 15th and Nov. 7th, 1916, and the full course extended over 12 days, until 36 grains of emetine bismuth iodide had been taken. The men treated in the first batch, however, had only eight or nine doses, some of which consisted of two tablets instead of three, so that they had only from 21 to 25 grains each; and two or three others who did not tolerate the drug well, but suffered from great depression, also had less than the full amount.

Each man was provided with a card on which were noted the daily dose and, opposite, the results—number of times sick and number of evacuations—which it produced. Each daily dose was administered by the medical officer's own hand. All the men were placed under the same conditions of living. The diet adopted comprised mainly milk, eggs, fish, puddings, mutton, and cabbage, steamed and sieved.

4. *The Effects of the Treatment on the Men.*

The behaviour of each case under this drug was very much the same.

They practically all were either purged or they vomited, or both. Usually a man who vomited much did not have so much diarrhœa, and a man who had much diarrhœa did not vomit so much; and usually whichever of the symptoms predominated at first, that was the most marked symptom throughout. Very few were violently attacked both ways. Out of the 102 cases, only 2 or 3 were not affected at all, either by vomiting or diarrhœa, and a few had one natural evacuation daily; while 5 vomited only once (see tables for details). The worst cases had on some days 10 or 12 motions in 24 hours, or vomited 5 or 6 or even more times in the day. Of real tolerance of the drug there was none; certainly a number of men as time went on were not so often sick, but that was the best that could be said. The vomiting usually began about an hour after taking the dose, the diarrhœa not often sooner than three hours. Two men had violent colic and required fomentations. It was noted that in the vomit the brick-red colour of the drug was fairly often seen, showing that the keratin coat dissolved before reaching the intestine.

Various stomach and bowel sedatives were tried to control irritation, but none were of any real use except tinct. opii, and that was only used in extreme cases. The tabloids were tried in powder, but the vomiting was sooner produced and increased in intensity; so this was discontinued. A few of the most disturbed cases were kept entirely in bed, which relieved, but did not save them from, attacks of diarrhœa and vomiting.

In three cases of old carriers (1378, 787, and 10) the effect of the treatment on the general health was very pleasing. All three, particularly a staff sergeant of the Indian Army, were weak, thin, pale, and depressed; after the course appetite came back, weight was regained, and all three reported that they felt like new men. In most cases, however, the men were, for the time being, considerably pulled down by the vomiting and diarrhœa produced by the treatment. All were heartily glad when the ordeal ended and they were set free.

The tables show the curative properties which the drug certainly possesses; but until its preparation has been improved, and its intensely irritating properties abated or removed, a just estimation of its value in chronic dysentery cannot be made.

5. *Collection and Examination of Specimens.*

It is obvious that the value of the microscopical examinations depends very largely upon the accuracy with which the identity of any particular specimen can be guaranteed. We think it wise to insist upon this fact, because in practice it is not easy, as might be supposed, to eliminate doubt.

There are in our experience, some men—we believe them to be few—who seem unable to realise the importance of the tests, and will exercise the utmost ingenuity in trying to substitute for specimens of their own fæces those of other men. In some cases this may be done as a joke; in others a man, who suspects himself to be positive, will endeavour to pass off as his own a specimen from a man known, by reason of his approaching discharge, to be free from infection. And even if the collection of specimens is so efficiently supervised that substitution is impossible, one man may persuade another to impersonate him with the same object in view. Elaborate precautions are therefore taken at this hospital to prevent the mixing of specimens,

* The numbers in brackets refer to the case numbers, for which see Tables I. and II.

and any sample about which there can be the slightest doubt is always rejected. We have reason to believe that in many hospitals the necessity for taking these precautions is not fully realised, and the tests made are, to a certain extent, unreliable in consequence.

The specimens were examined with the greatest care, and no test is recorded as negative unless at least two coverslip preparations, each from a different part of the fæces, had been searched without result. As a general rule the suspensions were made in normal saline, but iodine preparations were often used in addition. All problematical specimens, which were especially frequent immediately after treatment, were examined by both of the protozoologists at the hospital.

6. *Results of the Examinations.*

In the accompanying tables will be found the exact amount of the drug received by each man, the period of treatment, the number of doses, the amount of vomiting and diarrhœa produced, and a list of all the tests made, both before and after treatment. A date upon which *Entamœba histolytica* was found is given in italics. An asterisk after the date denotes the presence of cysts, a dagger that of free amœbæ. The presence of only a small number of cysts is marked by one asterisk, of a moderate number by two asterisks, and of a large number by three asterisks; while the number of free amœbæ present is indicated by a similar number of daggers.

The cases fall into two groups: those that may have been cured, and those that definitely relapsed. It is convenient to deal first with the latter group.

(*a*) *The cases that were not cured.*—There can be no doubt that in 19 out of the 102 cases the treatment failed to cure the men of their infections of *Entamœba histolytica*. It will be seen from the table that each of these cases had repeated positive tests after the end of treatment.

It is true that the finding of a small number of specimens of *Entamœba histolytica* on one or two occasions after treatment does not necessarily indicate that the man had not been cured. Thus, in Case 1299, two or three free amœbæ were found on the eighth day after treatment, and although the next two examinations were negative, one or two cysts of *Entamœba histolytica* were found on Nov. 24th, 26 days after treatment; but since then the case has been examined 15 times in the ensuing nine weeks, each time with a negative result; it therefore seems justifiable to include him among the probably cured.

In about half-a-dozen other cases a few degenerate cysts, which might possibly have been those of *Entamœba histolytica*, were found after the end of treatment (nearly always among large numbers of *E. coli* cysts). These cases were kept under observation longer than would otherwise have been the case; but as the small cysts did not recur, the tests have been recorded as negative.

In the 19 cases that were not cured, undoubted examples of *Entamœba histolytica* were found, often in large numbers, on at least two occasions after treatment; and the presence of the organism has been confirmed in each case by other workers since the men left the hospital.

Fifteen of these cases were examined at least once during treatment, and 14 of them were then found to be negative. It is well known, however, that carriers of *Entamœba histolytica* do not always pass cysts every day, at any rate in sufficient numbers to be found in practice (*v.* the examinations before treatment in the tables[1]); the fact that many of these men had one negative examination during treatment does not, therefore, necessarily indicate that they all cleared up temporarily owing to the action of the drug. It was, however, found impracticable to make several examinations of the men while under treatment; and, indeed, for all practical purposes, it is the examinations after treatment that are the most important.

One semi-acute case (787) had a double course of treatment. His general health improved, but at every examination numerous active amœbæ were found in the stools, and this continued after he left Barton. He has since been operated upon for amœbic abscess of the liver.

Another semi-acute case (10) also improved considerably in general health after treatment, but continued to pass at intervals sporadic active specimens of *Entamœba histolytica*. At Barton he had three full courses of the drug, the third course being given towards the end of November. After leaving the depôt he was reported to have passed on Dec. 18th and 19th large numbers of cysts of *Entamœba histolytica* and smaller numbers of them on the 20th and 21st (no cysts were ever found at Barton), which disappeared under a further course of the drug. Unfortunately, the man has gone back to India before his complete cure could be established.

It is difficult to assign any reason for the failure of these 19 cases. It is possible that in some of them the full effect of the drug was not obtained owing to a portion of the drug being lost through vomiting or diarrhœa; on the other hand, some of the worst cases in this respect are among those apparently cured (e.g., 968, 1540, 1628, 1686). Moreover, the first batch of men treated all had considerably less than a full course of the drug, while among them only two cases definitely relapsed.

Another possible reason for some failures may be the form of drug used. In all the cases previously reported upon[2] the drug was given as a powder enclosed in gelatin capsules. Perhaps in some cases the compressed keratin-coated tablets used at Barton may not have got thoroughly broken up, and some of the effect may thus have been lost. Nevertheless, the general production of intestinal disturbances and malaise tends to show that the drug did have some effect. It is possible that had the capsules been pounded up and put into cachets a more satisfactory result would have been obtained. (It is true that powdering the tablets was tried on one occasion at Barton, but from the accounts of some of the men the powder formed a kind of cement on the tongue and was difficult to swallow; a cachet or capsule would overcome this difficulty.) On the other hand, one case (C 26) at Chichester[3] was not cured by a course of 40 grains of the powdered drug, though he may have been cured by a subsequent course of 68 grains.

The duration of infection or the region where it was acquired may possibly have some effect, for it is noteworthy that four out of the five men who are known to have had dysentery previously in South Africa or India (viz., 10, 787, 1684, 1881) were among those who relapsed. There is no evidence, however, that the failure is in any way connected with the intensity or duration of the acute symptoms; indeed, among the relapses is included the one case that had never had any symptoms of acute dysentery (902).

Dobell has shown that emetine hydrochloride fails to cure about two-thirds of the cases treated. It seems to us that while emetine bismuth iodide is a much more efficient drug, nevertheless, at any rate in the form used at Barton, it may fail to extirpate about 20 to 25 per cent. of *Entamœba histolytica* infections. Again, a man who has once relapsed after emetine hydrochloride injections is very seldom cured by a further course of the drug,[4] and similarly the two cases (10 and 787) which had more than one course of emetine bismuth iodide at Barton were still not cured. All the cases that relapsed at Barton have again relapsed after another full course of the drug, with the exception of three men (899, 1393, and 1765). Of these, 1393 has been under observation since treatment for eight weeks, during which he has had nine examinations, all negative, while 1765 has had, similarly, six negative examinations in five weeks, and it seems likely therefore that both these cases have been cured.† The other case has only had four negative examinations (three within eight days of the end of treatment), and his "cure" is therefore much more open to doubt. It seems possible, however, that there may be some cases which are permanently resistant to emetine bismuth iodide.

(*b*) *Cases that were apparently cured.*—While there can be no doubt about the cases that relapsed, it is by no means so certain that the remainder were permanently cured, for it is conceivable that some relapsed after they were last examined. The evidence of cure depends upon the value of the negative examinations, and until we know more about the way the presence of *Entamœba histolytica* in the fæces of relapsing carriers may vary from day to day it is impossible to speak with certainty. We can, however, draw certain conclusions from the behaviour of the cases that did relapse.

The table shows that cysts generally reappeared in the fæces fairly soon after treatment had ceased; thus, out of the 19 cases 10 were discovered still to be infected on the first, 5 on the second, 3 on the third, and 1 on the fourth examination after treatment. The average number of days between the last dose and the first positive test was only 6·5, and it is probable that had daily examinations been made it would have been much smaller. The longest period between the last dose and the last negative test was never more than eight days, except in one case where it was four days longer.

The remaining cases, on the other hand, had an average of 4·3 negative tests after the end of treatment, the average number of days between the last dose and the last test being 17·3. Only one case did not have at least one examination later than the eighth day after the end of treatment, and many had three or four; indeed, if we take the 65 cases that had 12 doses we find that they had altogether 144 negative tests later than the eighth day after the end of treatment, an average of over two per man.

† Since this paper was written both the cases have relapsed. 1393 had 12 negative examinations after treatment at Mont Dore Hospital between the end of November and the middle of February, 1917. He had another negative test at Barton on Feb. 17th. He was subsequently reported to be passing blood in the stools, and a further examination on March 6th revealed the presence of large numbers of cysts of *E. histolytica*. In view of the long period during which this case was negative it is probable that the opinion expressed at the end of para. (*b*), concerning late relapses, will have to be somewhat modified.

It is improbable, therefore, that, had many cases relapsed later, some would not have been detected; and the foregoing facts, together with what we know of other cases followed over longer periods,[5] warrant us in the belief that the majority of these 83 cases may really have been permanently cured.

7. *On the Amount of Emetine Bismuth Iodide Necessary to Effect a Cure.*

Nineteen cases had only eight or nine doses, amounting to 21–25 grains of the drug, and other 7 had also less than 36 grains; yet of these 26 cases only 2 (899 and 1393) definitely relapsed. Most of the others had at least two negative tests

TABLE I.—*Cases that are not known to have relapsed after Treatment.*
(The italics in the table indicate the dates on which *Entamœba histolytica* was found.)

Lab. No. of case.	Total No. of grains of E.B.I. given.	Period of treatment.	No. of doses.	During treatment.				Dates of protozoological examinations.		No. of neg. tests after end of treatment.	No. of days between last dose and last test.
				Total No. of vomits.	Max. No. on one day.	Total No. of motions (approx.).	Max. No. on one day.	Examinations before 3rd day of treatment.	Examinations after 3rd day of treatment.

subsequent to the eighth day after treatment, and in only 9 cases was the last test previous to the thirteenth day after treatment. On the other hand, the two cases that relapsed are among the three that seem to have cleared up permanently after the second course of treatment (*v. supra* 6 (*a*) last para.), and it seems possible that on the first occasion they did not get sufficient of the drug.

It appears, therefore, that while there are undoubtedly cases which clear up under a smaller amount of the drug,[6] it is preferable to give the full course of 36 grains as a general rule. But if the ill-effects of the treatment on a man's general health are very marked, it would seem quite justifiable to give a somewhat shorter course, inasmuch as it seems likely that the first eight or nine doses of the drug may cure the great majority of those cases which it can cure at all.

8. *Length of Time during which it is Advisable to Keep Patients under Observation after Treatment.*

If all cases could be cured by the drug, as early work seemed to indicate, no examinations after treatment would, of course, be necessary. Our observations, however, seem to show that we may expect 20 to 25 per cent. of failures; and although this is a much better result than that obtained with emetine hydrochloride, yet it indicates that the success of the treatment should be checked by adequate protozoological supervision, if the end aimed at is the elimination of the convalescent carrier, in which case it is important that relapses should be detected.

The results detailed above seem to show that in the majority of cases that are going to relapse cysts will be found in the fæces within a very few days of the end of treatment, and somewhat earlier, apparently, on an average than in cases that relapse after treatment with emetine hydrochloride. One case, however, was not detected until the thirteenth day after completing his course, and if examinations are only made at intervals of a few days, some such cases are bound to escape earlier detection.

Again, it is evident that negative examinations made during or immediately after treatment are of very little value. Leaving out No. 10, which case was examined daily, 9 out of the remaining 18 cases were negative upon their first examination after treatment. In all, they were examined 77 times after treatment, and 30 of these examinations (nearly 40 per cent.) were negative, while 6 cases had two or more negative examinations.

From these considerations, therefore, it would appear advisable that cases which have been treated with emetine bismuth iodide should be kept under observation for not less than a fortnight after the completion of treatment, during which time as many tests as possible (certainly not less than four) should be made.

9. *Effects of Treatment on other Protozoa.*

Fifty-six of the carriers treated were found to be infected with *Entamœba coli*, in 13 of whom it was found once only. In 11 cases it was found only before, and in 11 others only after, treatment. It appears to be at least temporarily affected by the drug, disappearing during treatment, but generally reappearing sooner or later. There is, moreover, a remarkable similarity in the usual time of its reappearance to that of *E. histolytica* in the cases that relapsed. Thus, omitting the 11 cases in which it had not been found before treatment, it reappeared in 19 cases on the first, 12 on the second, and 3 on the third examination after treatment. The average number of days between the last dose and its reappearance was 6·05 (compared with 6·5 for *E. histolytica*), and the longest period between the last dose and the last negative test before its reappearance was eight days, as in the case of *E. histolytica*, except in one case, where it was 11. Thus in general its behaviour is strikingly similar to that of *E. histolytica* in those cases that relapsed.

On the other hand, the flagellate parasites of the small intestine appeared to be unaffected by the drug. *Giardia* (*Lamblia*) was found in 29 of the 102 cases, usually in the encysted form; it was present in the fæces on 10 occasions during treatment.

Chilomastix occurred in 12 cases; the unencysted form was less uncommon than that of *Giardia*, being present on seven occasions, four of them during treatment.

Trichomonas was found in 2 cases only, on the same date during treatment.

Conclusions.

1. Emetine bismuth iodide is much more effective than emetine hydrochloride in the treatment of carriers of *Entamœba histolytica*, but about 20 to 25 per cent. of failures may occur.

2. The intensely irritating properties of the drug in many cases are a drawback in its general application.‡

3. The definite failure to cure 19 out of the 102 cases treated at Barton may perhaps be in part due to the form of the drug employed (a keratin-coated tabloid).

4. It is improbable that there were many relapses later than those discovered; and as several of the cases had only eight or nine doses instead of 12, it seems likely that less than 36 grains may be effective.

5. It is advisable to keep cases under observation for not less than 14 days after treatment, and to examine them not less than four times during that period if relapses are to be detected.

6. The drug is without appreciable effect upon the intestinal flagellates, but has an effect, usually temporary, on *Entamœba coli*.

Acknowledgments.—For information relating to cases which were afterwards treated and studied at Mont Dore

‡ Since the above was written a new preparation of the drug in the form of salol-coated pills has been introduced by Dr. H. H. Dale; we are informed that this preparation of the drug is much less irritating than that used at Barton.

Military Hospital, Bournemouth, we are indebted to Captain S. Shepherd, R.A.M.C., and Mr. D. G. Lillie; for information regarding Case 10 to Dr. G. C. Low; Captain Cambell, R.A.M.C., of Hilsea Military Hospital, kindly enabled us to continue our observations on Case 1974.

POST-DYSENTERIC DIARRHŒA AND ITS TREATMENT.

(An Excerpt from Notes on 2000 Cases at the Military Dysentery Convalescent Hospital at Barton-on-Sea.)

BY W. WADDELL.

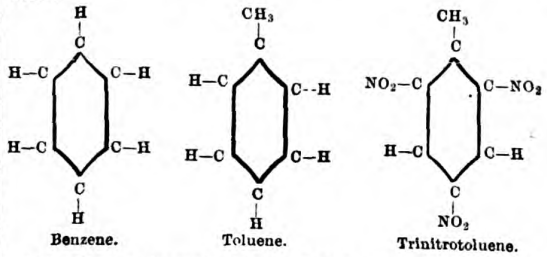
This is the commonest sequela of an attack of acute dysentery and it follows both the amœbic and bacillary form of the disease with little distinction between. The post-amœbic diarrhœa is certainly more persistent, and is more prone to relapses. The post-bacillary is more easily controlled and does not relapse anything like as often as the former.

Ordinary astringents may abate the diarrhœa in both cases, and in some cases no doubt stop it, but in most it returns as soon as the astringent medicine is left off, and the case may go on like this for months. The unsatisfactory results from the use of astringents led me to inspect regularly the dejecta, and much information was obtainable as to why astringents fail so frequently.

The motions varied from very pale and almost jaundice-like colour to dark brownish green; they were full of undigested food particles; and were all more or less putrid and highly offensive. The patients passing these motions, which vary in number from two to eight or ten daily, are naturally more or less debilitated and down in weight. The appetite is poor, sclerotics yellow, dull and injected, complexion usually pale, patients languid and dull.

All the symptoms, objective and subjective, indicate a derangement of the liver functions—particularly a dyscrasia of the bile, a reduced output, or both. A chemically deranged bile must needs result in a non-digestion of the bowel contents, and if also the bile flow is diminished, the antiseptic qualities being also inhibited, putrefaction of the bowel contents is directly encouraged. No worse condition could exist where intestinal catarrh is present than that the contents of the already irritated intestines should be in such irritating and septic conditions, as already has been pointed out. Astringents, therefore, often fail entirely, or only partially succeed in bottling up the poisonous bowel contents, and perhaps it is often fortunate they do fail.

Castor oil will give great relief to these cases, but only temporarily, so also will mag. sulph., but neither will bring about a large flow of clean healthy bile, the thing so much required. This, however, can be easily done by full doses of tincture of rhubarb, B.P.



My routine is to give every such case not less than from 4 drachms or even 6 drachms at one dose. Forty-eight hours having been allowed to work it off, the motions are again inspected. If their colour and composition is still unsatisfactory, a second or even a third similar dose is given. When their colour assumes a healthy brown or yellow tone, it indicates that the whole bowel is now freely flushed with clean healthy bile and its putrid contents got rid of. In many cases the diarrhœa now stops of its own accord, but if it still continues a few doses of some binding medicine will be now safe and successful. Usually I give 30 grains bismuth subnitrate with 10 drops of dilute hydrochloric acid and 10 of tinct. opii, two or three doses daily. The diet should be soft and bland so far as possible, and a tonic containing pepsine should follow cessation of the diarrhœa.

Calomel is too severe and causes a lot of colic; so does podophyllin. Euonymin is uncertain. Small doses of tinct. rhei are quite useless; the dose must be large and its action full and speedy. In carrier cases tinct. rhei is useless. It apparently has no effect on *E. histolytica*, whatever it may do to other entamœbæ such as *E. coli* or *Lamblia*, &c. The emetine bismuth iodide is, I believe, the antidote to the *E. histolytica*. This drug I have given in 200 cases with considerable success. Better results will yet be obtained when the drug is improved and rendered less an emetic and purgative, as, being frequently and quickly cast out of the body, there is not time for its full effects to be developed.

THE EFFECT OF TRINITROTOLUENE UPON THE BLOOD.

BY P. N. PANTON, M.A., M.B., B.C. CANTAB.,
CLINICAL PATHOLOGIST, THE LONDON HOSPITAL.

THE present manufacture of previously little used chemical substances upon an enormous scale happens to have thrown some light upon the obscure problem of the causation of blood diseases. We are, if we except chlorosis, as ignorant of the etiology of the so-called primary blood diseases as of their cure, and the proof that the absorption of a definite chemical compound can reproduce exactly a well-recognised blood state is worthy of consideration. Trinitrotoluene, or as it is commonly called T.N.T., is a benzene derivative, thus:—

The effect of benzol upon the blood has been recognised for several years, and the following papers upon this and allied substances may be briefly considered before describing the blood changes among workers in T.N.T.

Previous Observations.

The condition of the blood in men engaged in the manufacture of dinitrobenzol was investigated by Dr. Walter Malden[1] in 1907. The changes in the blood described by Dr. Malden are briefly as follows:—

The red cells are considerably reduced in numbers, they vary in size and shape, and very constantly show marked basophil granulation. Nucleated red cells are occasionally present. The hæmoglobin is proportionately decreased, the colour index being normal. The total white cells are increased, but with a considerable relative decrease in the polymorphonuclear cells. The eosinophil cells sometimes, and the mast cells more often, are relatively and absolutely increased. Dr. Malden's results are based upon the examination of 21 men employed and still at work. No cases of severe illness are apparently referred to in his paper. No animal experiments with D.N.B. are mentioned.

Dr. Selling[2] investigated the action of benzol upon the hæmatopoietic organs of guinea-pigs, and succeeded in producing in these animals a condition of aplastic anæmia. Dr. Selling was led to perform these experiments by the occurrence of three cases of benzol poisoning admitted to the Johns Hopkins Hospital. These cases, two of which terminated fatally, were employed in a tin-box factory for 4–5 months. On admission to the hospital they were suffering from high fever, purpura, and anæmia of the aplastic type. A description of the cases is to be found in the Bulletin of the Johns Hopkins Hospital.[3]

Klemperer and Hirschfeld.[4] These authors repeated Selling's experiments and found in their animals microscopic evidence of more or less severe marrow destruction, also, and in every case, severe and extensive necrosis of the liver and kidneys. They quote Pappenheim as having found similar necrosis in the liver and kidneys of guinea-pigs after 1–2 weeks' administration of 2–3 grammes of benzol. They further refer to experiments in which erythræmia was produced by administration of benzol in small doses.

Kiralyfi[5] describes a fatal case of leukæmia treated with benzol. The white cells became reduced from 73,000 per c.mm. to 460 per c.mm. when the patient died. No post-mortem account is given.

Neumann[6] describes another case of leukæmia treated with benzol in which the leucocytes fell from 56,000 to 5300 in 36 days when the treatment ceased. The leucocytes, however, continued to fall until they reached 200 per c.mm. when the patient died. Post mortem they found marrow changes similar to those produced by Selling in guinea-pigs, but the condition of the liver is not mentioned.

6 Therapie der Gegenwart, 1913, p. 56.

Mühlmann[7] describes a fatal case of lymphatic leukæmia treated with benzol. In the liver he found extensive necrosis of the central portions of the acini, as well as diffuse leukæmic infiltration. He refers to the necroses found by Pappenheim in the liver of guinea-pigs after benzol. The necroses in these animals were in the periphery of the lobules and not in the central portions.

Heffter[8] describes the case of a man poisoned by inhalation of benzol fumes. The man died within a few hours of inhaling the fumes. Heffter describes the post-mortem appearances and gives seven other references to cases of acute benzol poisoning. Benzol cannot be discovered in the body after death.

Stadelmann[9] investigated the effects of toluylenediamine on animals. Toluylenediamine has the formula $C_6H_3(NH_2)_2CH_3$. The drug gave different results with different animals. Dogs always got severe jaundice. Cats got hæmoglobinuria and usually slight jaundice. Guinea-pigs got marked anæmia and not true jaundice. No blood counts are given.

Willcox[10] describes cases of aeroplane "dope" poisoning. Willcox, by experiments on white rats, proved the constituent of the dope which causes jaundice to be tetrachlorethane. In this description of the human jaundiced cases he makes no mention of the blood condition. The association of tetrachlorethane with dope poisoning had been previously proved and published by Heffter and Joachimoglu.[11]

Investigation of those Actually at Work.

In considering the effect of T.N.T. upon the blood it was thought worth while to examine first by the ordinary methods of blood-counting and microscopy the blood of a series of people actually at work upon the substance. Fifty cases were thus examined and the results tabulated. The tables are not given here, but are included in a report to the T.N.T. Advisory Committee. The 50 cases were all women and all at work at the time of the examination. The cases were taken more or less at haphazard, but a few women who were noticed in the works to look pallid were purposely examined, and those who had been the longest employed were especially asked for. A large percentage had slight blueness of the lips and a few were markedly cyanosed. The girls, as a whole, looked fit and well. Some were of pallid complexion, but this is no guide to the blood condition. The time employed in the factory varied from one year and three months to a few days. It may be said at once that there is no evidence that the daily absorption of T.N.T. by these women had any deleterious effect upon the blood.

The red cells, hæmoglobin, and colour index are not adversely affected. I judged the average number of red cells in women of this class to be between 5 and 6 million to the c.mm., and nearer the latter than the former number; and the average hæmoglobin percentage to be about 90 per cent. or possibly a little under.

A subsequent routine examination of a number of girls employed in the manipulation of another substance leads me to think that the normal standard is probably lower than that given, and suggests that the average worker in T.N.T. may receive actual benefit to the number of red cells and the percentage of hæmoglobin.

I thought at first that the lowest readings occurred among the latest comers to the works, but this is not borne out by the figures.

The average number of red cells among those employed more than three months (24 cases) is 5,200,000 per c.mm., the average hæmoglobin percentage is 88·7. The average red cells among those employed less than three months (26 cases) is 5,700,000 and the average hæmoglobin 90 per cent.

If those employed one month or less are taken and the case of an abnormal plethoric girl employed only a few days is omitted, 9 cases are left with average red cells 5,500,000 and average hæmoglobin 86·1 per cent.

These numbers are sufficiently close to justify the statement that no appreciable change in the number of red cells nor in the percentage of hæmoglobin could be traced to a duration of employment greater than one month.

The morphological characters of the red cells throughout were normal. Not a single nucleated red cell nor a single cell showing granular degeneration was observed in 50 stained preparations. A very slight degree of poikilocytosis was seen in a few films. Three of the more anæmic cases were re-examined two weeks later and were found to be slightly less anæmic. Slight degrees of anæmia are necessarily found in examinations of girls of this age and condition. So far as the red cells and hæmoglobin are concerned no such changes are found as were noted by Malden among the D.N.B. workers. Yet the women at this factory were daily absorbing doses of T.N.T., since, at the time of this examination, Professor Benjamin Moore had proved the elimination of a T.N.T. compound in the urine of all workers examined. There is no alternation of labour in this factory.

The white cells of the blood in a very large percentage of cases were well above the normal number, and that this increase resulted from the employment is suggested by the high figures found among those longest employed. In 40 cases at work more than one month the average number of leucocytes was 10,000 per c.mm. In 9 cases employed one month or less the average number was 7500. I should judge the normal number to be from 4000 to 6000. The relative proportions of the white cells were not greatly altered, but many cases with high counts showed a distinct relative increase in the polynuclear neutrophils. The eosinophil cells were in a large number of cases above the normal. Very few abnormal white cells were seen in any preparation. In view of the blood changes found in the cases of severe anæmia to be described, it seems probable that this leucocytosis, usually of the inflammatory type, is due to a stimulation of the hæmatopoietic system by the poison.

In addition, 100 women, chosen at random from those at work in the same factory, were investigated as to cyanosis and cholæmia.

A.—*The incidence of cyanosis.*—It is unfortunate that on the days on which this examination was made the weather was very cold and bitter, so that it was often impossible to decide between the blue lips of toxic cyanosis and those due to atmospheric conditions.

All the cases examined were seen immediately after the conclusion of their shift, and of the 100 cases 78 were noticed to be cyanosed; of the 78, 18 were markedly cyanosed.

A percentage of 78 probably exaggerates the incidence of cyanosis owing to the atmospheric conditions before mentioned. The most marked case of all, on further examination, turned out to be in all probability the subject of congenital morbus cordis. Another case had suffered from rheumatic fever. But if every allowance is made it is evident that some degree of cyanosis is very common among employees.

The cause of the cyanosis has been taken to be the presence of methæmoglobin in the blood. It is probably a mixture of methæmoglobin and NO hæmoglobin. The amount of the substance in the blood is insufficient to give a spectrum with the ordinary small spectroscope, and proof of its presence rests upon the use of a test devised by Haldane. This test is extremely simple to perform, but in my experience in these cases almost impossible to interpret.

In this investigation an accurate dilution of the blood was made in each instance—namely, 10 c.mm. of blood in 1 c.c. of water. Normal bloods were taken as controls. In each sample the oxyhæmoglobin was converted into CO hæmoglobin by the passage of coal gas. Blood containing a trace of methæmoglobin appears of a muddy colour when contrasted in daylight with the bright pink of pure CO hæmoglobin. The amount of the abnormal substance in the blood of these women is so small that in scarcely a single instance was a really obvious result obtained, nor did the results of the test correspond with the clinical degree of cyanosis. Thirty-six were noted as giving a positive result, but in only two of these was the reading at all definite. An obvious difficulty in reading these minute differences of colour is caused by the different values of hæmoglobin in the various samples. I have since been informed that clearer results are obtained by the use of pure CO in preference to coal gas.

Both toluol and amatol powders give off in small quantities at room temperature gases smelling strongly of nitrous oxide. It is true that T.N.T. sublimes as such, but the sublimate is white, the crude powder is yellow, and presumably over nitrated, since if T.N.T. is washed in water the powder becomes white and the water yellow. No such smell is given off by the sample of D.N.B. in my possession. Further, ammonium nitrate, a constituent of amatol, if warmed gives off laughing gas, but if heated NO in addition.

In the following experiment two guinea-pigs were killed, one by exposure to amyl nitrite vapour, the other by NO. The blood of both animals gave Haldane's test, and the animal killed by NO vapour gave a stronger test in dilute solution of its blood than the other animal. The possibility of NO hæmoglobin or the usual mixture of NO and methæmoglobin being produced in the blood of workers by the

[7] Deutsch. Med. Woch., xxxix., p. 2083. [8] Ibid., p. 182, 1915.
[9] Der Icterus, Stuttgart, 1891. [10] THE LANCET, 1915, vol. i., p. 544.
[11] Vierteljahrschr. f. gerichtl. Med. u. öffentl. Sanitätswesen, 1914, xlviii. supp., p. 32.

inhalation of nitrous fumes has to be considered, but the percentage of such fumes in the atmosphere at any time must be extremely small.

B.—*The incidence of cholæmia.*—It was thought that the percentage of workers with bile pigment in the serum might be a guide to the incidence of liver changes without actual jaundice.

A sample of blood was taken from each of the hundred workers into a serum tube and allowed to stand until the next day, when the colour of the serum was examined by daylight. In 20 of the cases the serum was bile-tinged. This would appear to show that in a high proportion of those at work some action of the poison upon the liver was taking place. Allowance must, however, be made for the fact that among ordinary members of the community a small percentage of bile-stained sera are found, particularly among those subject to constipation. All of these employees were women, but even so a percentage of 20 bile-stained sera would seem unduly high. No case was noticed to be jaundiced, and only three sera were at all deeply bile-tinged. Even a percentage of three cases of toxic cholæmia would lend support to the supposition that T.N.T. workers may be receiving damage to the liver without attacks of sickness or toxic jaundice.

The 20 per cent. of cases with bile-tinged sera is, however, sufficient practical objection to placing workers on the sick list on this account alone.

Normal persons may have bile-tinged sera, but in my experience the appearance of bile in normal sera is periodic. The serum of a worker which remained obviously bile-tinged over a period of 10 days and in spite of purgation would be very suggestive of poisoning.

The conclusions, then, to be drawn from an investigation of those actually at work and in contact with T.N.T. are as follows.

1. That no adverse effect is produced on the red cells and hæmoglobin; but, on the contrary, it is suggested that some stimulation of the erythroblastic tissues is induced.

2. That there is an appreciable increase in the leucocytes, an increase which, in view of the changes which may occur in T.N.T. poisoning, may be ascribed to a noticeable stimulation of the leucoblastic tissues by the drug.

3. That cyanosis is common among T.N.T. workers, and that the cause of the cyanosis is possibly the production of NO hæmoglobin, possibly methæmoglobin, probably a mixture of both compounds.

4. That bile pigment is present in the blood in such a proportion of cases as to make it possible that liver damage is taking place in the absence of symptoms, but owing to the occurrence of bile-tinged sera in otherwise normal individuals such damage cannot be taken as proved, and the test cannot be accepted as ground for removing a workman from his employment.

Investigation of Cases of Sickness.

In the next place, cases of sickness arising among T.N.T. workers were investigated. These cases include a few examples of minor illnesses, a number of severe anæmia cases without jaundice, and a considerable number of toxic jaundice cases. These anæmic and jaundiced cases were examined where possible over intervals of time. Cases of anæmia were seen without jaundice, and of jaundice without anæmia. Some jaundiced cases subsequently developed anæmia, and in view of the extreme gravity of the form of anæmia set up the relationship of the anæmia to the jaundice was particularly investigated.

In addition to the ordinary blood examinations, certain other tests were performed in some instances. Bile was looked for in the serum; the fragility of the red cells was estimated and, following certain observations communicated to me by Dr. F. H. Jacob, of Nottingham, the Wassermann test was performed in a few cases.

In all 34 cases of sickness arising among T.N.T. workers were investigated. Of these 34 cases, 4 were examples of somewhat severe gastric disturbance without jaundice or anæmia, 6 were suffering from the peculiar form of anæmia to be described, and 28 had toxic jaundice. Four of the anæmic cases were jaundiced also. The main points in the routine blood examinations of all these cases are shown in the table.

Gastritis cases.—Of these four cases, No. 18, a young girl of 18 years, showed a notable degree of anæmia, but the blood changes were not those of the aplastic type. After five days' absence from work she was still cyanosed, and her blood gave a strongly positive Haldane test. The fragility of her red cells was normal. Case 19 had had several attacks of gastritis, and had never been jaundiced. The blood condition was normal. Cases 23 and 24 were both men who had been sent to hospital as instances of early toxic jaundice. Both had gastric symptoms and deposits of conjunctival fat; neither was jaundiced. The blood condition was normal in both cases, and the serum quite free from bile.

Toxic jaundice and anæmia.—While considering these two conditions under the same heading, I believe them to be distinct and separate pathological states not necessarily dependent the one upon the other.

It has been suggested that the T.N.T. poison produces first a methæmoglobinæmia, then hæmolysis, and finally anæmia. The suggestion does not appeal to me in theory, and such evidence as I have been able to collect is opposed to it. It appears that while the jaundice follows destruction of the liver tissue, the anæmia follows destruction not of the blood but of the red marrow. What may be the exact substances which produce these changes, and whether these substances are in the two cases identical are matters of speculation; what is certain is that jaundice occurs without blood changes, and, more important, blood changes occur without either jaundice or liver destruction.

The percentage of jaundiced cases developing anæmia.—In an interesting article in THE LANCET of Jan. 27th, 1917, Captain M. J. Stewart gives a résumé of a paper read by him at the Royal Society of Medicine. Of 14 cases of toxic jaundice he considered 13 to show definite blood changes, but of these 13 only 3 showed any marked anæmia, which he describes as of the "pernicious" anæmia type.

The blood changes referred to by Captain Stewart include a leucocytosis, a leucopenia with a relative lymphocytosis and an eosinophilia. The leucocytosis and the eosinophilia I have shown to be present very constantly in T.N.T. workers, and it is probably due to stimulation of the red marrow. A leucopenia with a relative lymphocytosis is an accompaniment of aplastic anæmia, but has little significance in the absence of red cell changes. The number of leucocytes and the percentage of lymphocytes are subject to wide variations in health. The total number is very commonly lower, and the percentage of lymphocytes usually higher in normal persons than is indicated in the majority of text-books. This is so far unfortunate in that a leucopenia with a relative lymphocytosis has been described by many observers as typical of this or that pathological state. Of Captain Stewart's 14 cases, only three show severe blood changes, and these, with the possible exception of one case, I should prefer to describe as of the "aplastic" rather than of the "pernicious" anæmia type.

Of the 28 examples of toxic jaundice considered here, only four have shown blood changes of importance, and the changes in these four cases have been those of aplastic anæmia. It is possible that some of these cases may develop anæmia, but it is unlikely. So far as possible all cases seen in the acute jaundiced condition have been re-examined about three months later. Other cases were seen for the first time in the convalescent stage 6–9 months after jaundice first appeared. Aplastic anæmia is not a transitory condition, it may be fatal in about seven weeks (see Case 2), or it may drag on for months (see Case 1 and Case 5). I have not yet seen a case of complete recovery.

If Captain Stewart's cases are added to those in the table we have 42 cases of toxic jaundice, of which 7 developed severe anæmia, or a percentage of 16·6. Such a percentage is sufficient to indicate that T.N.T. workers who develop toxic jaundice run a definite risk of acquiring aplastic anæmia also.

The nature of the jaundice.—The incidence, the mortality, and the prognosis of toxic jaundice is beyond the scope of this examination. Certain points, however, may be noted because they tend to vitiate the official statistics.

A number of cases notified as toxic jaundice are not jaundiced at all. A few such cases have been met with in this investigation. In all cases of doubt the serum should be examined. A patient with a clear serum has not got toxic jaundice. A patient with a bile-tinged serum may have.

All cases of catarrhal jaundice occurring in T.N.T. workers are unavoidably notified as instances of toxic jaundice. Some mild examples of jaundice in the table are in all probability cases of simple catarrhal jaundice. Other rarer forms of jaundice will also help to swell the figures. Case 3 is probably an example of familial hæmolytic icterus with possibly toxic jaundice in addition.

The nature of the jaundice is properly described as a toxic jaundice, and the toxic substance acts upon the liver cells. It is not a hæmolytic jaundice, since, in the majority of cases, there is no evidence of blood destruction. In those cases met with here in which anæmia supervenes the blood changes commenced as the icterus passed off (see Cases 4, 5, and 6).

In the rare condition known as hæmolytic icterus the *fragility* of the red cells is greatly increased, in other forms of jaundice it is slightly diminished. In one convalescent case examined here the fragility was normal; in three jaundiced cases the fragility was diminished.

The relationship of the Wassermann reaction to toxic jaundice is a point of some interest. If all, or a high percentage of, toxic-jaundiced patients gave a positive Wassermann reaction it might be argued that the reaction resulted from the effect of the poison and not from syphilis. Dr. Jacob informed me that he found a positive Wassermann reaction in three consecutive cases of severe jaundice. I examined one severe case and seven convalescent cases, the majority of whom still had bile-tinged sera and had been very severely jaundiced. The reaction was negative in all cases. It is suggested that a positive Wassermann reaction in toxic jaundice is proof of syphilitic infection, and though the jaundice in such cases may be toxic and not syphilitic it is probable that a syphilitic person is more susceptible to the action of the poison than a normal individual, a detail with some bearing upon the question of compensation.

The latency of the jaundice is well shown in Case 16, a woman who left work owing to an injury and five weeks later developed jaundice. The long period which may elapse between exposure to the poison and development of symptoms is well known and very remarkable. It is referred to again in considering the anæmic cases.

The duration and after-effects of toxic jaundice.—An examination of a series of cases of toxic jaundice leaves one with the impression that the illness is long and serious and that a complete recovery is possibly more rare than is supposed.

The actual mortality I am not in a position to state; it is probably considerably higher than appears in the official notifications owing to the number of cases returned, often unavoidably, which are not instances of toxic jaundice, and a further percentage returned as recovered, who may still succumb to the after-effects of the poison.

Some of the cases in the table were seen as long as nine months after the appearance of the jaundice and still showed bile in the serum. Case 5 became jaundiced in April, 1916, recovered, and returned to work, but not in T.N.T. He died of aplastic anæmia on Feb. 16th, 1917. His liver was scarred and puckered as the result of his old jaundice.

I have scarcely seen a single convalescent case who admits feeling as well as formerly. The majority display a noticeable lassitude and loss of energy.

The persistence of bile in the serum is remarkable. Of these 28 cases the serum was free at the time of the last examination in seven only. Of these seven, four were only slight cases, and possibly instances of catarrhal jaundice. Of the remaining three cases two were severe and the serum was clear eight months and nine months respectively after the onset.

It is probable that all severe cases are left with damaged livers, but it cannot yet be stated whether the change is progressive or not.

The nature of the anæmia.—The six cases of anæmia met with in T.N.T. workers appear at the beginning of the table. The full development of the condition is best shown in Case 4.

The type of anæmia produced is that known as aplastic anæmia. This condition is met with in ordinary civil practice, but it is extremely rare. It is far less frequently seen than the unusual blood state—pernicious anæmia. Aplastic anæmia has been occasionally noted to develop as the result of a definite poison such as benzol, but cases are from time to time met with in whom no clue to the causation of the disease can be detected. Two such cases were recently in-patients of the London Hospital, but instances of pernicious anæmia at this hospital must be more than ten times as numerous. I have not met with an example of pernicious anæmia among T.N.T. workers.

Aplastic anæmia can be differentiated from pernicious anæmia during life by an examination of the blood, and after death by the changes found in the organs.

Pernicious anæmia appears to be a disease characterised by abnormal blood destruction imperfectly compensated for by abnormal marrow activity. Aplastic anæmia appears to be produced by red marrow destruction.

The changes found in the blood in aplastic anæmia are as follows:—The red cells become steadily reduced in numbers, but retain the normal or more than the normal percentage of hæmoglobin. Consequently, in spite of the fall in the percentage of hæmoglobin which accompanies the diminution of red cells the colour index is high, as in pernicious anæmia.

The diminution in the number of red cells takes place without change in their morphology. Poikilocytosis, polychromatophilia, and granular degeneration with the appearance of normoblasts and megaloblasts, all characteristic of pernicious anæmia, are almost entirely absent in this condition. A few such abnormal cells may appear at the time of death, but during the course of the disease they are absent. Some alteration in the relative sizes of the red corpuscles is usual, but in every other respect the appearance of these cells in a stained film is normal.

The total number of leucocytes shows an equally characteristic diminution, and this diminution takes place almost entirely at the expense of the granular or essentially marrow cells. The polynuclear neutrophil leucocytes in one of these cases were reduced to 4 per cent. of a total leucocyte count of 1000 per c.mm. These scanty survivors of the marrow cells were noticeably degenerate in appearance, and their granulation was more sparse than appears in normal cells. The lymphocytes, on the other hand, were perfectly normal in their appearance and were not greatly reduced in total numbers. Since the characteristic feature, post mortem, is the disappearance of the red marrow, the blood picture during life yields information as to the sites of origin of the granular and non-granular cells respectively. This atrophy of the leucoblastic marrow may be considered in connexion with the leucocytosis found to be prevalent among T.N.T. workers. It is suggestive that the poison stimulates marrow activity, and that in exceptional circumstances the stimulation is succeeded by destruction.

The latency of the anæmia.—If the period which may elapse between absorption of the poison and development of icterus is remarkable, the latency of the anæmia is more remarkable still; it is also in jaundiced cases developing anæmia more possible to observe. In Case 4 the anæmic state did not become noticeable until about six weeks after the appearance of jaundice. In Case 5 the anæmia developed nine months after employment in T.N.T., but in this case it is probable that some changes were present at an earlier date, and in the interval the man had returned to work in a T.N.T. factory, though he was not actually handling T.N.T. In Case 6 the anæmia developed four months after leaving work, and while still in hospital, as the result of toxic jaundice.

The explanation of this latency cannot yet be given. It has been suggested that the poison is ingested, stored in the tissues, and subsequently liberated. Yet it has not been possible to detect T.N.T. or T.N.T. derivatives in any of the organs of fatal cases, and in view of the extreme length of the latent period such an explanation seems to me improbable.

The course of the anæmia.—Of the six cases described here two are dead. One died about seven weeks after the anæmia was recognised, the other about five weeks after. A mortality of one in three does not, however, represent the gravity of the condition. I have never known a case of aplastic anæmia in civil practice to recover, and none of these cases are yet out of danger. The six cases might be increased to seven by the addition of a similar example to Case 2, arising in the same factory, in whom the cause of death was proved post mortem. This would make seven cases with three deaths. Case 3 has a peculiar condition, and is possibly not aplastic anæmia. If this is omitted we have six cases with three deaths. Case 4[12] is extremely unlikely to recover. Case 6 has not yet completely developed. Case 1 is the only patient so far to show any sign of recovery, and his blood condition is definitely improving. Improvement, however, may occur even in aplastic anæmia, only to be followed by a fatal relapse.

The peculiar anæmia which may affect T.N.T. workers is therefore an extremely dangerous and fatal disease. It is not yet possible to say whether it is ever recovered from. Fortunately, it is a very rare condition, and the risk to any individual worker in T.N.T. of dying from this disease is almost negligible.

Drugs appear to have little or no effect upon the course of the disease. The most rational treatment would appear to be a course of transfusions of blood. To be of use numerous transfusions, each of 500–600 c.c. over a period of several weeks, would be indicated in order to give the red marrow a chance of recovery. It was unfortunately not possible to attempt this method of treatment in any of the patients seen by me. Residence of the patient in a large general hospital is, at the present time, essential if treatment by transfusion is to succeed.

Purpura has been mentioned as having been noted in cases of benzol poisoning. Two cases of purpura—both fatal—have been notified by Dr. Jacob among T.N.T. workers at Nottingham. The following patient, not included in the 32 cases of the table, was recently admitted to the London Hospital: J. E., a girl of 21, had been working on the manufacture of T.N.T. for seven months and until a fortnight previously, when the works were closed down. She was stated to have been on several occasions overcome by the fumes developed in the nitrating process. A girl who worked with her was said to have recently developed toxic jaundice. Ten days before admission she commenced to bleed from the vagina, and subsequently from the rectum and mouth. On admission she was extremely ill, was bleeding profusely, and had a purpuric rash over the limbs and trunk.

A blood examination showed—

Red cells 1,200,000 per c.mm.	Colour index ... 0·3
Hæmoglobin ... 8 per cent.	White cells ... 480 per c.mm.

[12] Case 4 has since died—April, 1917.

Of the white cells, 75 per cent. were lymphocytes and only 10 per cent. polynuclears. The stained blood picture was that of aplastic anæmia.

The coagulation time estimated by Wright's method was four minutes.

The patient died two days later, and post mortem no liver necrosis was present, the vertebral marrow was grey, and there was less than the normal amount of red marrow in humerus and femur.

In view of the blood condition, the post-mortem appearances, and the striking tendency of aplastic anæmia subjects to profuse bleeding, I think it probable that the purpura was an incident in the course of a case of aplastic anæmia, and that the profuse hæmorrhage hastened death and altered the colour-index to the chlorotic type.

Such a case, if nothing had been known of the patient's connexion with T.N.T., would have been classed as "hæmorrhagic purpura," of which, as of all purpuras, we

* My = Myeloblast.

1. J. B. still an out-patient at Nottingham, 1.3.17. No evidence of cord changes. 2. P. C. Typical changes of aplastic anæmia post mortem. No toxic liver changes. Identical with a previous case at the same arsenal. 3. H. H. states that she has always been jaundiced and her father also. Possibly a case of hæmolytic icterus, but the present blood condition strongly suggests "aplastic" changes in addition. 4. S. S. now very seriously ill and unlikely to recover. (Died April, 1917). 5. E. K. went steadily downhill and died on Feb. 16th of aplastic anæmia. His liver showed the old scarring of his toxic jaundice attack. On returning to work, he is stated *not* to have handled T.N.T. 6. R. R. still under treatment as an in-patient at the Nottingham General Hospital, March, 1917. 11. K. D. now an out-patient. 12. W. B. still an in-patient. 13. H. K. left hospital Dec. 13th, 1916, and has not worked since. 15. E. P. left hospital Jan. 18th. Still complains of lassitude. 20. L. P. died Feb. 3rd. 22. A. J. G. now recovered, but does not feel fit and is not at work.

know practically nothing. This girl was definitely exposed to "fumes," as also were other cases of aplastic anæmia met with in the course of this investigation. J. E. showed little or no staining of the hands, but was sufficiently in contact with T.N.T. to have absorbed a poisonous dose through the skin.

A very similar case has recently occurred under the care of Dr. Christine Pillman, to whom I am indebted for the following account:—

A. P., a woman working in T.N.T., was admitted to the Royal Free Hospital on Feb. 28th, 1917, with toxic jaundice, and was discharged in April. On May 8th her conjunctivæ were still bile-tinged and she developed a well-marked purpuric eruption. On readmission to the Royal Free Hospital the following blood state was found:—

Red cells 2,800,000 per c.mm.	Colour index ... 0·8.
Hæmoglobin ... 50 per cent.	Leucocytes 4600 per c.mm.

The differential count showed—

	%		%
Polynuclear neutrophils	24·6	Eosinophils	0·6
Lymphocytes	74·6	Mast cells	0·2

The case is evidently one of toxic jaundice followed by aplastic anæmia with purpura.[13]

The following is a summary of the conclusions to be drawn from these cases.

Four severe *gastritis* cases examined showed no blood changes of importance.

Toxic jaundice and anæmia appear to be separate and independent pathological states.

Anæmia may occur without jaundice and without liver necrosis.

About 17 per cent. of jaundice cases develop anæmia.

The incidence of toxic jaundice is probably overstated, both in medical certificates and in official reports.

In toxic jaundice the fragility of the red cells is altered as in ordinary obstructive or catarrhal jaundice.

A positive Wassermann reaction in a case of toxic jaundice is evidence of syphilitic infection.

Toxic jaundice proper is a long and serious illness, which may persist for nine months, leaving the patient less fit than formerly, and in all probability with a permanently damaged liver.

The jaundice is due to the action of the toxic substance upon the liver and not to hæmolysis.

The type of anæmia produced is that known as aplastic anæmia. It appears to follow destruction of the red marrow, and is to be differentiated from pernicious anæmia.

The latency of the blood changes may be even longer than the latency of the jaundice. The anæmia may develop so long as nine months after ceasing to work in T.N.T.

The anæmia is extremely fatal, and it is still doubtful if any cases recover from it.

The incidence of the anæmia among T.N.T. workers must be very small.

Purpura may develop with the anæmia and a case may first come under observation with hæmorrhage and a purpuric rash.

Finally, certain animal experiments were performed. Attempts were made to reproduce in animals the changes in the liver and other organs associated with jaundice and the blood changes found in human beings. The actual substance responsible for these changes and the mode by which it is introduced into the system is generally held to be trinitrotoluene itself, which is mainly absorbed through the skin. While Professor Benjamin Moore's work on this subject seems almost conclusive, it was felt that every possibility should be investigated in view of the importance of the subject, and bearing in mind the fact that the changes had not as yet been reproduced in animals by the administration of T.N.T. In these experiments T.N.T. was administered to rabbits through the skin by hypodermic inoculation, as also were D.N.B. and ammonium nitrate. Pure NO gas was administered to rabbits and white rats by inhalation over periods of time. It seemed possible that the spacing of the doses of T.N.T. might be of importance, that a considerable dose followed at the appropriate interval by a further dose might sensitise the animal and lead to poisoning, whereas similar daily doses might be tolerated. This point was investigated in these experiments.

The experimental work is not yet concluded, but it may be stated that the results are for the most part negative. Large doses, up to a gramme, of T.N.T. dissolved in toluol can be given to rabbits without any serious effect. Injections of dinitrobenzol were similarly harmless. NO gas given to rabbits and white rats gave rise to cyanosis, drowsiness, and a yellow staining of the fur, but to no other ill-effects. If the percentage of NO gas in the fume-chamber was allowed to rise too high respiratory distress resulted, and in one or two instances dyspnœa remained for several days, but in no case was sufficient of the gas given to produce a fatal pulmonary complication. The animals, even with small quantities of the gas, showed cyanosis and gave a positive Haldane test in the blood. Neither jaundice nor anæmia was induced in any instance.

In the first part of this investigation I received considerable assistance from Dr. Jenkins Oliver and in the latter part from Dr. R. Paddock. My colleague, Dr. S. K. Vaidya, has helped me throughout, and in particular with the routine blood examinations. Physicians at various general hospitals in charge of these patients have freely placed their notes and cases at my disposal. Dr. Jacob, at Nottingham, and Dr. M. G. Thackrah and Dr. J. A. Barnes, in London, have taken much trouble in finding suitable cases for me. Mr. Minter, the works manager of a factory, greatly simplified the work done on his premises. I am particularly indebted to Dr. W. J. O'Donovan for his assistance and advice. All expenses incurred in connexion with the investigation have been defrayed by the Ministry of Munitions and a grant has been further provided by the Medical Research Committee.

[13] This patient has since died (June 19th, 1917), and was found post-mortem by Dr. Spilsbury to have, in addition to a scarred and shrunken liver, the marrow changes of aplastic anæmia.

WAR SURGERY IN SERBIA:

PENETRATING WOUNDS OF THE ABDOMEN.

BY FERGUS ARMSTRONG, M.D. EDIN., F.R.C.S. EDIN.,

LATE MAJOR (SANITATE), SERBIAN ARMY; CHIEF SURGEON, SERBIAN RELIEF FUND'S (LADY PAGET'S) HOSPITAL, USKUB.

THE object of this paper is to make a plea for operation in all cases of perforated intestine due to bullet wounds. Not only does this apply to cases received in the first 16 hours, but also to those received up to 40 hours after injury, and, in fact, to all cases where condition of patient will allow operation.

The cases mentioned were treated by me at Lady Paget's Hospital at Uskub, Serbia, and consisted of Serbians, Macedonians, and Bulgarians wounded during the Serbian retreat in 1915. The hospital was housed in two blocks and three pavilions. The two blocks were newly built cadet schools and in every way up-to-date buildings. The largest number of cases in hospital at one time was 1040. The conditions for operation were as perfect as possible in any Balkan military hospital, fully trained British sisters being in charge of the wards with Austrian and, later, Serbian prisoners acting as orderlies. The patients were all healthy Balkan soldiers, whose resistant power was second to none.

The conditions in the Balkans are such that comparison with surgery on the Western front is not justifiable, and the best comparison is with the South African War. A review of the literature of the first and second Balkan wars shows what a deplorable state of affairs existed.

The only writers mentioning abdominal cases in those wars are Girault and Laurens. Girault passed the month of November, 1912, at Uskub, where our hospital was situated. He states that the wounds were of about eight days' duration when seen at the ambulance after a long transport. Of 120 cases discharged, taken haphazard, he had not one wounded abdomen. At the Serbian Military Hospital installed at the Grad (a hospital which last year was run on English lines by the Wimborne Unit (2nd) of the Serbian Relief Fund) several hundred wounded were under treatment. Girault saw there only one case of wound of the abdomen, and that not a penetrating one. Thus one concludes that *every* case of abdominal wound causing perforation died. Laurens, having passed 11 months in the Balkans, has made analogous observations.

Treatment.

Medical treatment.—The cases not having operative treatment were placed in the sitting Fowler position. Subcutaneous saline was given by Lane's apparatus, as much as six pints in 24 hours in some cases. Pituitary extract and camphor in oil were given. No food, not even fluid, given by mouth for first three days. For restlessness hyoscine 1/150 gr., morphia 1/6 gr., repeated when necessary. Distension is very difficult to treat in general peritonitis; enemata of all kinds were tried, and a flatus tube was used; eserine salicylate hypodermically was found of no appreciable value.

Surgical treatment: 1. *Laparotomy.*—On admission all patients with lesions of intestine were stimulated, for all were in profound shock from exposure on battlefield and delayed transport. After the case had been stripped and put in warm clothing saline was introduced by Lane's apparatus; hyoscine 1/150 gr., morphia 1/6 gr., were also given. In half an hour open ether was administered by the drop method. Never did I allow chloroform in these cases. Anæsthesia was easily produced, owing to state of patient and preliminary scopolomorphine injection.

Incision was through either right or left rectus, or in mid-line according to site of entrance wound. First I sought for the ileo-cæcal valve and systematically followed the small intestine backwards, bringing each coil out of abdomen for visual examination. Each perforation was sutured with silk by the Czerny-Lembert method. No irrigation of peritoneal cavity. Dry gauze mops and gauze plugging were used to absorb blood and purulent fluid. The exposed coil of intestine was protected by abdominal pads wrung out of hot saline. No clamps were used; an assistant held the perforation on the stretch for suturing. In some cases I put in cigarette drains into peritoneal cavity—one into pouch of Douglas and the other down to most affected coil. The cases that recovered had no drainage-tubes in peritoneal cavity, and I am more and more inclined from results to discard intraperitoneal drainage altogether, except where one has a definite localised abscess. The abdomen was closed in layers with small cigarette drain left down to peritoneum. The wounds always suppurated; this is due to *Bacillus coli*, and so a certain number of antibodies get formed and have a beneficial influence on the underlying general peritonitis.

After-treatment is similar to that described under medical treatment. Most important is subcutaneous saline; it is well to change site of injection from pectoral region to inner surface of thigh alternately. I have given up rectal saline in war hospitals as I find the subcutaneous method much more efficient, and I have not had an abscess or cellulitis at site of needle introduction. Most patients leave the table in better condition than on admission, and cases with no pulse to be felt at commencement of operation have gone to the ward with distinctly perceptible pulse after ether saline stimulation in spite of an extensive operation.

2. *Murphy's operation.*—Murphy, of Chicago, has described excellent results obtained in general peritonitis by this operation, which I practised on one occasion.

Patient wounded 36 hours previously; unsafe to move him into theatre; operation done in bed. About 4 c.c. of 1 per cent. solution of novocain were injected in mid-line suprapubically. Incision 2 inches long through parietes and peritoneum. A rubber tube was then passed down into base of pouch of Douglas. The wound was firmly closed round circumference of tube, where it passed through the parietes, as it is essential not to have any extra-abdominal pressure here. Patient died in 2½ hours.

The intra-abdominal pressure is supposed to cause a free exit of purulent fluid in these cases of general peritonitis. This case is only mentioned as a method of surgical treatment of very bad cases.

Cases.

I. Laparotomy cases of abdominal wounds which showed no perforation of intestine. (Cases 1 and 2; both recovered.)

II. Laparotomy cases (Nos. 3–12) with multiple perforations of intestines of over 30 hours' duration. 7 deaths, 3 recoveries.

CASE 3.—Soldier wounded 32 hours before admission. Entrance and exit wounds showed that bullet had crossed abdomen from right iliac region to left loin. Patient collapsed, pulse imperceptible; abdomen soft and tender in all areas. Laparotomy after half an hour's stimulation by subcutaneous saline. Quantity of blood in peritoneal cavity. Appendix had been amputated by bullet. Eight perforations of small intestine; mesentery punctured in four places. The perforations were sutured and abdomen closed. Death in 14 hours.

An interesting feature of this case was a round worm (*Ascaris lumbricoides*) protruding an inch through a perforation.

CASE 4.—Soldier wounded 39 hours before admission. Entrance wound in left hypochondriac region, exit in left loin. Pulse imperceptible. Abdomen generally tender; no rigidity detected. Laparotomy; five perforations of ileum; general peritonitis marked. Perforations sutured and abdomen closed. Death in 24 hours.

CASE 5.—Soldier wounded 37 hours before admission. Bullet track and condition of patient similar to Case 4. On opening abdomen four perforations of ileum seen. A round worm was seen free in peritoneal cavity, and another had 1 inch of its body protruding through a perforation. Death 60 hours after operation.

CASE 6.—Soldier wounded 34 hours before admission. Entrance and exit wounds showed bullet had crossed abdomen. After saline stimulation immediate laparotomy. Six perforations of small intestine detected. Death on second day after operation.

CASE 7.—Soldier wounded 39 hours before admission. Entrance wound only was seen in umbilical region. Laparotomy; three perforations of small intestine, one of mesentery. Death 60 hours after operation.

CASE 8.—Soldier wounded 35–37 hours before admission. Entrance wound in left lumbar region, exit in right loin. On opening abdomen six perforations of small intestine were detected. Death 14 hours after operation.

CASE 9.—Soldier wounded 32 hours before admission. Entrance wound in left lumbar region, exit to left of third lumbar vertebra. On opening abdomen five perforations of ileum were found. Death in 12 hours.

CASE 10.—Serbian soldier wounded 35 hours before admission by bullet at about 400 yards range. Entrance wound midway between pubes and umbilicus, exit in left loin. On admission patient in profound shock; had walked 12 kilometres and been conveyed 13 in Balkan carriage. Pulse imperceptible. Abdomen slightly distended; very slight tenderness on pressure, but no special area tender; recti not rigid. Laparotomy after preliminary stimulation for half an hour by saline subcutaneously. General peritonitis; four perforations in third foot of ileum (two double perforations about 5 inches apart). On manipulation contents began to escape. The perforations were rapidly sutured, peritoneal cavity closed, and small cigarette drain inserted in parietes. Uneventful recovery, except that parietal wound became septic. Three months later the patient, who had been taken prisoner in hospital by the Bulgarians, was sent to prisoners' compound.

CASE 11.—Soldier admitted 36 hours after wound. Bullet had crossed abdomen antero-posteriorly from left anterior lumbar region. Condition of patient similar to Case 10. Laparotomy; three perforations of small intestine. Perforations sutured and wound closed as in Case 10. Uneventful recovery, except that for three weeks T. was intermittent, as high as 104° at times. It gradually fell, and three months later patient was ready for discharge.

CASE 12.—Soldier admitted 34 hours after bullet wound of abdomen. range unknown. Entrance wound was a fine perforation situated on right linea semilunaris on line joining anterior superior spine and umbilicus; exit wound an inch to left of mid-line posteriorly. Abdomen slightly distended; definite tenderness over right iliac region. General condition of patient bad, but better than in Cases 10 and 11. Pulse felt, but 135 in rate. Complete paralysis of right leg. Laparotomy; two perforations of cæcum in same plane; bullet had entered on anterior and passed out on inner surface. Some weak adhesions present in neighbourhood. The perforations were sutured. No perforations of small intestine discovered. Abdomen closed with tube to parietal peritoneum. Good recovery, although wound suppurated badly. Paralysis of right leg passed off, and 2½ months after operation patient was discharged for convalescence.

In all the above ten cases I believe death would have occurred had there been no interference. The pulse was perceptible on admission in only one case (No. 12). All had suffered from exposure on battle-field and in transport for over 30 hours.

III. Cases (Nos. 13–19) of over 30 hours' duration, due to a bullet wound, treated by abstention treatment. 7 cases, 7 deaths. These cases were consecutive, and were taken as a control to test the abstention treatment as compared with the laparotomy cases, also consecutive.

IV. Case (No. 20) of over 30 hours' duration, treated by Murphy's operation. One case; death in 2½ hours.

V. Two autopsies (Cases 21–22) to demonstrate death due to hæmorrhage.

CASE 21.—Wound received over 30 hours previously. Died in receiving-room in 10 minutes. Autopsy: Bullet had passed through right gastro-epiploic artery of stomach; abdomen filled with blood. Also perforation of stomach at point where artery had been severed. Undoubtedly had this case been operated on within 25 hours of receiving the wound, he would have lived.

VI. Three cases (Nos. 23–25) illustrating rigidity of recti due to injury of diaphragm; all recovered.

VII. One case (No. 26) of abdominal wound, cured spontaneously at home. In this case obviously the bullet had missed the intestine. It is mentioned as a case which the abstentionists would probably have classed as a cure.

Comments.

Out of several thousand wounded all cases of penetrating wounds of abdomen were sent to our hospital, so it is correct to state that all such cases not sent to us died on the battlefield.

Hæmorrhage is the most frequent cause of death in penetrating wounds of the abdomen in the first hours. Cases 21 and 22 are remarkable examples of hæmorrhage from larger vessels (gastro-epiploic and hæmorrhoidal veins) surviving 30 hours.

The round worm (*Ascaris lumbricoides*) was present in Cases 3 and 5. I have not been able to find any reference to such an occurrence. It is a question whether the worm in Case 5 escaped through the perforation during the operation. If it were in the peritoneal cavity immediately after the wound occurred it would constitute a method of spread of peritonitis. It could break down any weak adhesions during its exit, and also it could carry *Bacilli coli* and so inoculate distal parts of the peritoneum. This is pure conjecture, and the opinion of a helminthologist would be interesting. Most people in the Balkans suffer from these parasites, and the matter is therefore of importance.

Intermittent rigidity of the recti muscles is an important sign of an injured diaphragm (Cases 23, 24, and 25). In all, the wounds were such as to coincide with a wound of the diaphragm, and the question arose whether in addition there was any visceral lesion. The cases, seen soon after injury, exhibited an "intermittent rigidity" of both recti lasting

for several minutes, and then the recti would become flaccid for about an hour. This sign passed off after about 36 hours. It is not to be confounded with the rigidity of peritonitis.

Many cases of spontaneous recovery of penetrating wounds of the abdomen have not had a perforation of the intestine. A bullet can cross the abdomen without causing any material damage to the viscera (Cases 1 and 2). The correct treatment of penetrating wounds of the abdomen due to bullet wounds is immediate laparotomy after preliminary stimulation with saline. This treatment ought to be carried out in all cases and at all stages after injury, for recovery may result in the worst cases, even of over 30 hours' duration (Cases 10, 11, and 12). Operation can only be performed successfully in a favourable surgical locale, and each division ought to have a mobile ambulance where such cases can be treated without passing through the various other stations.

Note.—Since writing above I have had the pleasure of seeing the motor operating theatre to be presented to the Italian Army by the Wounded Allies Relief Committee. I was very pleased to hear from Sir William Collins, the designer, that another was being built for the Belgian Army.

SOME OBSERVATIONS ON TRENCH FEVER.

BY E. R. GRIEVESON, M.B., CH.B. EDIN.,
CAPTAIN, R.A.M.C. (T.C.)

MY attention was called insistently to the nature of this disease by having six bouts in two separate attacks of trench fever (hereafter called "T.F.") in May and August of 1916. I had seen some hundreds of cases previously. I observed at that time that it appeared to be infectious, four cases occurring in a single dug-out containing five men, and no cases occurring, so far as I can remember, among the remainder of the men belonging to a group of batteries at that time. Just before my first attack there were a number of cases of catarrhal influenza in the headquarters' mess to which I at first attributed my condition. I was, however, speedily disillusioned by the temperature chart (three days fever, three days no fever) and by the absence of catarrhal symptoms.

At this time, from previous experience, I was of opinion that 90 per cent. of cases of aches and pains in the back and lower limbs with temperature in officers were influenza and 10 per cent. trench fever, while among N.C.O.'s and men the converse ratio obtained. This, of course, was based on the rough provisional diagnosis which a battalion M.O. may well make after seeing a large number of cases. From a subsequent experience I am of opinion that many of the influenza cases were really T.F., while influenza did exist on the Western front. About a month after my first attack I had breathlessness and tachycardia on exertion. For instance, my pulse ran up to 240 after playing a set of tennis, exerting oneself as little as possible. True dilatation was not present and the cardiac condition appeared to both a specialist and myself to be purely nervous in origin. I succeeded, however, in assisting, in the French sense, at the battle of the Somme for two months, being fortunate enough to have the use of a motor cycle or a car for half this period. I became infected again with T.F., and as I found it impossible to walk 20 yards over rough ground without breathlessness I was evacuated to England.

On one matter I held from experience a very clear and firm opinion. With such a heart it is essential to walk slowly and without impedimenta, even a 10 lb. haversack rapidly causing distress, while as long as one walked slowly no ill-effects were felt.

On returning to the front in December, and joining a battalion about the middle of January, with which I remained two months, I observed five cases of T.F. (considering as such the various types otherwise described as X disease, P.U.O., &c.) which occurred in a single dug-out holding eight men, within 16 days, the sixth man having had it previously. Every case had a heart affected similarly to my own, but in less degree.

I suggested provisionally that T.F. should be considered as infectious, early notification, isolation, and, in view of the supposed association with lice, that energetic de-lousing methods should be proceeded with. Major Hurst's paper in the *Journal of the Royal Army Medical Corps* of February, 1916, had not then been published, nor did I see this until the end of March. Owing to the exigencies of the military situation radical measures could not be proceeded with, and I found it necessary to keep a number of T.F. cases in a sick dug-out.

For the first month my records are not as complete as they might be, but on appointing a clerk who was both capable, reliable, and understood scientific and statistical methods, results were obtained which appear to be of some importance. At the end of the first month I found that 40 per cent. of my hospital evacuations were trench fever. We came across then in THE LANCET the record of a single experiment showing that a louse could transmit T.F., the incubation period being 14 or 15 days. Taking this as provisionally probable I set to work to get records of all the men with whom each case coming to me with T.F. symptoms had slept for a month previously. This, owing to battalion arrangements, and owing to the fact that cases grouped themselves markedly in platoons, was easier than was expected, and the evidence of unreliable men could frequently be checked by that of those more reliable.

On March 10th I reported that there was practically no sickness of any importance in the battalion from a military standpoint, with the exception of T.F. and a few cases of diarrhœa. T.F. had by this time so increased that it was now 66 per cent. of all cases (excluding eyes and teeth) coming sick to me.

Trench fever is stated to have been known to the Belgians before trenches formed an unhappy feature of the landscape; it was known to at least one doctor in Serbia in one of the Balkan wars—and, as far as I can discover, at that time was undiagnosed; it was recognised, as Major Hurst records, at Salonica, and known to Austrian troops in the Tyrol and to Germans on the Eastern front. With regard to the general diagnosis I agree with practically all of Major Hurst's conclusions. The essential point to remember, which I verified by subsequent observation in about a hundred cases, is that when a man comes complaining of aches and pains confined to the lower parts of the body, more particularly in the small of the back, and almost certainly down the legs, probably, but not necessarily, in the shins (deep in the bone), with a fairly high temperature at night, looking well, though flushed, with clear eyes, and probably with a tongue which I shall describe later, a history of sudden onset and of more acute pain in the night than in the morning, when trench fever is known to be in the battalion or unit—then the chances against this patient suffering from T.F. are remote in the extreme. As an instance I showed to my C.O. before making an examination a man with an exceptionally healthy appearance, a normal temperature, a smile as he described his agonies of the night before, and his pain in the back resembling the lumbago of unenthusiastic soldiers, and I pointed out how that man might easily be mistaken for a malingerer; but I stated also that he might quite well have a temperature of 103° at night, which actually occurred. The secret of the prophecy lay in the fact that he had a fast pulse, which differed from the malingerer's pulse by remaining fast when his attention was distracted from his ailments.

When I was leaving my battalion, Private Norman Graves, undeterred by either the enemy, or, what was worse, the cold, or, what was worse still, trench fever, with a temperature of 103°, carried the major portion of the work which follows almost to its conclusion.

About one quarter of the trench strength of the battalion suffered from T.F. within approximately two months; about one-half of these were studied carefully, exact records of each being taken in shorthand, and charts showing the time distribution, the platoon distribution, and the bedmate distribution were made, with, in addition, graphs of frequency. Among the companies in the line all had within 22 days practically the same number of cases, with the exception of one company with about 30 per cent. less. This company, curiously enough, differed from the rest in allowing men to sleep, not necessarily in the same groups (which in other companies remained more or less permanent), but more or less as they pleased. As, however, I cannot state to what extent this company had suffered previously owing to the deficiency in the earlier records, nor the extent of the constant redistribution of the men no accurate deduction can be drawn. I believe, however, that the company had suffered previously badly, and, in fact, worse than the others. When

the cases were classified by platoons very striking results occurred. Platoons as such slept together in groups varying from 3 or 4 to 10 or 20, the one in trenches and the other in rest. Certain platoons were found to lose within a month 60 per cent. of their numbers by T.F., while other platoons lost practically none. No difference of conditions could be found in either case. In a number of cases if a man unknown to me came with temperature and aches and pains in the lower half of his body, as soon as he told me his company I would inform him which platoon he was in, subsequently verifying the diagnosis, and in a few cases without consulting my records I managed to tell him with whom he slept a fortnight previously, and conversely my clerk would prophesy in the main correctly who was to be expected on sick parade with the typical symptoms during the next few days. When, however, the cases were studied by their bed-mate groups (to be strictly accurate the definition of a bed might not satisfy purists either of style or comfort) the results were still more striking; for all but a very few cases could be traced to small groups of bedfellows, or rather co-sleepers, so that if a man slept with one group at the approximate time he ran 50 times the chance of getting T.F. than if he had slept with certain other groups in the same companies.

The typical case was as follows:—

A man, or quite frequently a N.C.O., would go sick with T.F. on, for example, Feb. 1st. On Feb. 15th one of his two or three co-sleepers would take T.F. and a day or two afterwards either the whole three, or two, of his co-sleepers would fall sick. The same thing would happen when the first case occurred in rest billets, but then only a certain proportion of his co-sleepers would fall victims out of the larger group. On this date, the 15th, he would himself fall sick again—in many cases. In such an event the original case having returned to his fellow-sleepers, or rather to what remained of them, or finding other bed-mates, he (typically) would infect them and they would fall sick on March 1st, on which date he might possibly have another attack, or not. In either case a certain proportion of his co-sleepers would fall sick on March 15th, one generally to the day, the others a day or two afterwards. All these cases were liable to infect new co-sleepers, and some of these co-sleepers would fall sick 14 days later. It must be stated frankly that the isolation of the cases was not such that other possibilities of infection were fully excluded, but from the study of the whole number of cases no other conclusion was possible than that T.F. has an incubation period of 14 days, possibly plus or minus one day.

So marked was the infectivity that out of all the platoons in the line one half had six and a half times as many cases as the other half, though men were occasionally transferred from one platoon to another. The crucial point that the blanket-mate was immediately infected while other co-sleepers were infected a day or two later lacked sufficient evidence to prove it; but it appears to me sufficiently probable that the disease may well be called "blanket-mate fever," though even the blanket may in some cases be missing. As to the carriage by lice, no other conclusion could be arrived at, leaving out of account the recent alleged discovery of the spirochæte in the louse. While obviously infectious in my series of cases T.F. is practically non-infectious in England; is much less infectious under better conditions a few miles behind the line than in the line itself, and varies roughly in infectivity in proportion to contiguity.

It is well known to men, but not always to the authorities, that under cold conditions blankets are practically always shared by adjacent men in the line; that under rough conditions behind the line this also occurs, while under comfortable conditions this does not occur. As to the travelling capacity of the louse, so much is this believed in that many men are convinced that the louse has a special predilection for non-lousy men, so that if a clean man sleeps with lousy men even for a single night he is at once singled out for attack by a raiding party. This, however, is a fallacy. The better class of men (if lousy at all) catch on the average from 3 to 10 lice a day, and generally obtain a night's rest as a result of their exertions, while the less enthusiastic or more pessimistic men catch none, and harbour from 20 to 1000 lice. It is obvious that a few lice travelling from a very lousy man will be more noticed by a non-lousy man or slightly lousy man than by one who is "crawling." Bearing in mind that only a proportion of lice are infected with the virus, I found the distribution of T.F. far more closely following the general distribution of lice than of any other probable cause; for instance, officers suffer less than men, and when single cases occur among officers T.F. does not become markedly epidemic among them.

The transport was practically non-lousy, and only a single case occurred in two months. Headquarters company, under better conditions than the rest, had one-tenth of the expectation, according to company distribution. I found them fairly free from lice.

As to the question of over-work causing T.F., my observations are by no means in harmony with this. Nor is the distribution of T.F. *pari passu* with the fatigue of individual men or individual groups. T.F. attacked alike those who had responded to the call of Lord Kitchener and those who gave a somewhat less energetic response to that of Lord Derby. The number of cases during the exceedingly cold weather of February was larger than that during the damp and sloppy weather of January, while other illnesses decreased. Non-commissioned officers, too, who are somewhat less exposed to fatigue than men were attacked at least as freely as the men, and in some cases more so. The explanation of the belief that exposure is an essential is that when exposure occurs men share blankets and sleep closer to one another. When over-fatigue occurs not only are official methods of de-lousing apt to be postponed but the men themselves pay less attention to de-lousing themselves by their own methods. As these require about an hour a day, as the hunter will assure you, it is natural to find them omitted

Against the louse-borne theory there are the following facts: N.C.O.'s are at least as liable to T.F. as men, and while, as Peacock shows, 95 per cent. of the infantry are lousy, this percentage does not hold with N.C.O.'s as a rule.

As for myself, I have never found a louse on myself or my clothing, and in view of these facts the following is put forward speculatively as an explanation. Apparently there is an immunity to louse-bites as opposed to lousiness. In a number of battalions where 90 to 99 per cent. of the men admit some lousiness I have repeatedly found that only 5 to 10 per cent. show obvious marks of louse-bites. If such an immunity exists, and such immunity is only partial, a single infected louse may infect a fairly immune man, while a man who harbours 50 to 1000 lice does not increase his liability in the same proportion, in view of the fact that the sources from which he draws his lice are frequently more restricted than that of the N.C.O.'s.

The explanation of the cases, of which I have a fair number, re-infecting themselves after 14 days has yet to be sought. The type is apparently essentially a carrier. He starts the trouble in several of my instances, and infects one other, as a rule, exactly 14 days after the date of his first attack, others a day or two afterwards, and in odd instances he is found to be again feverish 28 days after his original attack.

The tongue of trench fever, which I have not seen previously described, occurs typically on the first day, is very marked during the pyrexial period, occurs in perhaps 80 per cent. of cases, remains as a rule during the first week or two, and can sometimes be recognised as much as three months afterwards. It is characterised by a red margin $\frac{1}{4}$ to $\frac{1}{5}$ of an inch wide, with a thick and bright yellow fur covering the rest: this fur during apyrexia may be dull and slightly brownish in appearance, especially in those of bilious temperament. The arterioles on the side of the tongue may be markedly injected. So characteristic is this tongue that stretcher-bearers, whose virtues were military rather than medical, would frequently make a provisional diagnosis for my information which I subsequently confirmed.

As to the sequelæ of T.F. the most important observed were anæmia and disordered action of the heart. The anæmia comes on in about 10 to 15 per cent. of cases, the intensity and duration of the preliminary fever bearing a certain relation to this. One or two cases were observed where good keen men had "stuck it," doing their duty in the trenches with night temperatures up to 102°. One such, an orderly corporal, who would not go sick during the first three days, though with the fever and weakness he could barely walk, was observed, and at any time up to three weeks afterwards could be recognised as anæmic, by those who knew him, at a distance of 50 yards.

Tachycardia is, as far as could be observed, practically always to be found in these cases. The importance of

it and dyspnœa from a standpoint of battalion efficiency is very marked, for we give no information to the enemy in stating that more than three-fourths of modern warfare is sheer hard labour. The same type of effect is probably produced by the sequelæ of T.F. as is produced by malaria in tropical countries among military expeditions. Willing, keen men are unable to do their work for physical reasons, and from the sense of undue over-exertion become depressed in mind. T.F. itself and its sequelæ do not appear *directly* to cause depression of spirits to any marked extent in the later stages. Officers, for instance, complain little of this, their chief complaint being that they feel the cold badly. Men who have borne reputation for ability to avoid the trenches are in some cases chronic mild trench fever cases, who by their ingenuity in inventing symptoms have failed to receive attention for their real disease. The temperature, however, is slightly raised, the typical tongue is often present, and the pains mild and diffused but real. When they are reduced to telling the truth a previous history of T.F., generally fairly acute at the outset, is obtained, and the type appears to be the 14-day type, and they seem to be carriers.

As to treatment, sedatives appear useful and massage, in my opinion, concentrates the attention like massed artillery upon the aching shins, and malingering may easily be produced. The pains appear to bear very fairly exact ratio to the temperature. Patients seem to do well either staying in bed or taking exercise, but moping all day in an attitude of depression is bad.

A clear understanding that the disease runs its course, carrying with it some to "Blighty," and none to a better world than that—that the painless period of apyrexia may continue indefinitely, and if it does not the pain will certainly be less than before, will do more to assure and relieve the vast majority of patients than anything else.

I have frequently tried to verify the statement that the temperature may go up suddenly as a result of exposure to cold. While it may occur I found no evidence of it even in the early stages of the disease. I do not see, *pace* the cardiac specialist, that the tachycardiac case should not take on the duty of a sentry even with this condition. Sergeants, for instance, are able to carry on for a considerable period with very marked tachycardia, and are apparently unaware that they suffer from it until they exert themselves unduly, as in training.

The T.F. man is not liable to feel the cold unduly provided he is well wrapped up, and displays a little intelligence; with the cöoperation of the cooks, bricks can be heated, covered with sandbags, and placed between the blankets, even within earshot of the enemy. (Such bricks will remain warm for about three hours and can be used successfully for wounded men either when waiting to be dressed or during transport down the trenches.)

The alternative to such a use of men as this is months of rest and light duty. Unhappy and painful meditations as to whether the sergeant in charge has given one too much work for light duty constitutes sometimes the major portion of the work done. From my own and a few other cases it appears that the cardiac condition tends to cure itself in time, nature being the best guide as to the maximum of exertion advisable. There must be no tall peaks on the graphs of the curves of energy expended per minute or per hour, but without impedimenta and with suitable intervals of rest it is quite possible for such a case to cover 10 to 15 miles in a day on good ground, without distress or apparent harm even with a pulse of 240 on undue exertion.

In view of the incidence of this disease and the nature of its sequelæ it is of grave import from a military standpoint. Captain Muir shows[1] that in eight successive months, while a division was actively engaged, 350 cases per month were sent to the three field ambulances; add to these the D.A.H.'s derived from T.F. cases but only admitted as D.A.H., and add, too, the undiagnosed cases (and such form a large number, I believe), and you have a morbidity rate which can only be equalled by such plagues as typhus, or as typhoid formerly, or as malaria.

As to prophylaxis, I cannot do better than quote from Major Hurst: "As the disease is probably conveyed by lice, which become infected by biting a patient during an attack, every effort should be made to keep troops free from them. All cases of T.F. should either be sent to hospital or isolated, and the patient's clothes and bedding should be specially disinfected as well as that of men who have recently slept near him, and after the initial or second attack a man is often able to return to duty. It is very important that he should be kept under observation, and if he again becomes verminous his clothes and bedding should again be disinfected. Men who are still having attacks or have recently recovered should sleep together, isolated from the other men in their unit, but there is no reason why they should not work with them."

To this I am only anxious to add that the value should be insisted on of early diagnosis, notification, and isolation in hospital.

THE PRE-MENINGITIC RASH OF CEREBRO-SPINAL FEVER.

BY C. P. SYMONDS, M.R.C.P. LOND., M.R.C.S.,
TEMPORARY CAPTAIN, R.A.M.C.

VARIOUS observers[1] have noted that there may be an erythematous rash in cerebro-spinal fever—Rolleston[2] in a recently published series of 95 cases mentioned it as occurring in 5, whilst in another 5 there was a so-called rose rash; but no one, so far as I am aware, has remarked upon the time relations of this eruption to (*a*) the onset of the illness, and (*b*) the first symptoms of meningitis. In a fair experience of the disease (about 50 cases) I have in 3 cases seen this erythematous rash; it was in each instance observed very early after the onset, and before there were any symptoms of meningitis to suggest the diagnosis, so that it is perhaps worth recording the details.

CASE 1.—Private T., aged 32 years, had been in hospital for five days with dyspepsia; there were no physical signs of organic disease. At 2 A.M. he woke up with a fit of shivering, complained of headache, vomited, and was restless. His temperature later in the morning was 102°F., and when examined at 10 A.M. he showed a profuse rash on the chest, abdomen, and back. This consisted of erythematous spots of about the size of the finger-nail, which faded on pressure, and were just distinctly papular to the touch. There were no physical signs except a little sticky pharyngitis. Kernig's sign and neck stiffness were looked for, and were not present. Later in the morning this rash began to fade on the trunk and to appear on the legs and arms, and by 2 P.M. had disappeared entirely.

At 3 P.M. the patient was examined by a consulting physician and neurologist, who suggested malaria as a possible diagnosis. He was next seen at 5 P.M., when he was irritable, complained of pain in the back of the neck, and showed a positive Kernig's sign. Lumbar puncture performed at 7 P.M. yielded fairly turbid fluid under pressure, containing meningococci and pus cells.

CASE 2.—Cadet B. was admitted to hospital one morning for acute tonsillitis of two or three days' standing. He had a temperature of 100° F. and a rapid pulse. There was a sticky greyish exudate on the fauces, extending on to the soft palate, and the question of diphtheria was raised in diagnosis. There were no signs of meningitis present either on admission or on the evening of the same day.

At about 6 A.M. on the following day an erythematous rash was noticed on the trunk, and the patient was seen by a medical officer, who ordered him to be treated with precautions as a possible case of measles. At 10 A.M. the rash was fading on the trunk but well marked on the limbs, including the palms of the hands and the soles of the feet. The individual spots were distinctly raised and averaged about the size of a threepenny-piece. The mental condition was rather confused, but there were no definite signs of meningitis. At 1 P.M. there was a little neck stiffness and a doubtful Kernig's sign, and the spots were now fading from the hands and feet.

Lumbar puncture was performed and a faintly opalescent fluid was obtained, which on standing showed a fine fibrinous clot containing meningococci.

CASE 3.—2nd A.M. L. was taken suddenly ill in the middle of the night and admitted to hospital next day at 1 P.M. The medical officer on duty found that he had a temperature of 100° F. and an erythematous rash on the trunk which suggested measles. He examined the patient for signs of meningitis, which were not present. At 7 P.M. the erythematous spots had vanished from the trunk, but there were a few present on the hands and feet which were already fading. In addition there were now present on the trunk and limbs fine scattered spots typical of cerebro-spinal fever, the patient was confused and incoherent, and neck stiffness and Kernig's sign were both definitely present.

The cerebro-spinal fluid was turbid and contained pus and meningococci in large numbers.

In Case 1, where the patient was under observation from the onset, there was a profuse rash to be seen six hours later, which had disappeared four hours after it had first been observed. In Case 3 the erythematous rash was present 12 hours after the onset and had almost disappeared six hours later. In Case 2 the probability is that there was primarily a local meningococcal infection of the throat and naso-pharynx, and that this became a general infection after

[1] Osler's Medicine. [2] THE LANCET, 1917, 1., 55.

the patient's admission to hospital. Probably therefore in all three cases the rash had made its appearance and faded away within 24 hours of the onset of the general infection, and it was certainly a striking feature of each case before meningeal symptoms suggested the diagnosis.

These cases tend to confirm the hypothesis put forward by Lundie, Maclagan,[3] and others that there is a septicæmic stage in cerebro-spinal fever which precedes the meningitis, and fall into line with a most interesting case[4] recently reported in THE LANCET in which agglutination tests afforded evidence to show that an infection of acute onset with an early rash, similar to that described above, was a meningococcal septicæmia which had stopped short of meningitis.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

PURPURIC AND CEREBRAL SYMPTOMS OCCURRING IN THE DEFERVESCENCE OF ENGLISH MEASLES: TWO FATAL CASES.

BY T. GODDARD NICHOLSON, M.B., B.Sc. LOND.

THE invasion of morbilli is often accompanied by grave disturbances of the hæmic and nervous systems, but occurrence of these serious lesions after the defervescence is not so well recognised.

CASE 1. *Purpura, convulsions, and mental symptoms following defervescence; recovery.*—A youth, aged 17 years, whose fever and rash had subsided on the fifth day after the first appearance of the severe eruption and who seemed to be well in the afternoon of that day, became suddenly unconscious at 7 P.M. He fell over on his right side, breathing stertorously, and convulsions affecting the whole body soon succeeded. These spasms lasted with but short remissions for 15 minutes. At the end of this period he was easily roused, but appeared terrified, as he could not see. The pupils were semi-dilated, but no optic neuritis or hæmorrhages in the retina were detected, the knee-jerks and the other reflexes were normal. Synchronously with the unconsciousness a coarse purpuric rash appeared on the face and neck, which quickly spread over his whole body. Within an hour of his seizure the youth became very restless, delirious, and made violent attempts to get out of bed, while "insanity of location" developed. Hyoscine hydrobromide 1/100 grain, morphine hydrochloride ¼ grain, were injected, determining tranquillity and a peaceful sleep, which lasted for 14 hours.

On awakening a condition allied to that of "cerebral irritation" after head concussion had developed. In this condition he remained for four days, when, with the fading of the purpuric rash, he recovered completely. Retention of urine and incontinence of fæces accompanied the mental symptoms. A marked retraction of the head on the first day after the seizure, coupled with Kernig's sign, determined a lumbar puncture, but the clear fluid obtained was normal to both chemical and microscopic tests.

On his recovery the patient had no recollection whatever of his attack, nor of any events occurring while mental aberration obtained, but he recollected the transient blindness at the incidence. On the nineteenth day after the appearance of the measles rash he was quite well.

CASE 2. *Mental disturbance after defervescence; recurring hæmatemesis; death.*—A youth, aged 15 years, on the second day after the severe measles rash had developed, and when it had begun to fade and the temperature had fallen to 100·8° F., commenced vomiting food with altered blood. A persistent hæmatemesis ensued, accompanied by severe constant pain over the fundus of the stomach, which was not distended, nor were any signs of perforation present. The obstinate vomiting was uncontrollable by drugs and caused great exhaustion, but ceased after 80 hours.

Soon after the incidence of the emesis the fading rash became much duskier, while the boy became delirious, restless, and lost his orientation power. With the cessation of the vomiting the mental condition became normal, the appetite returned, and food was retained. Except for a slight bronchitis he seemed well, and on the sixth day after the first sign of rash the temperature fell to normal. However, on the following day persistent hæmatemesis with great pain over the fundus recurred with a gradually rising temperature. The boy became cyanosed and collapsed, while the temperature rose to 105° F., and despite the exhibition of warm oxygen and cardiac stimulants he died of heart failure on the eighth day following the morbillar eruption.

CASE 3. *Mental symptoms complicating defervescence.*—A youth, aged 17 years, whose temperature and pulse had fallen to normal on the sixth day following that of the eruption, became on that day delirious, restless, and affected by "insanity of location." After persisting for 48 hours, without any febrile developments, he fell asleep and after a quiet night woke up in a normal condition. He suffered no other complication and was discharged well on the sixteenth day after the development of the rash.

CASE 4. *Mental symptoms with the defervescence, accentuating later and followed by acute appendicitis; recovery.*—A well-developed male, aged 39 years, showed marked restlessness as his acute rash faded and the temperature and pulse subsided on the fourth day after the eruption showed itself. On the fifth day, while the temperature and pulse were normal, great restlessness associated with delusions of persecution and "insanity of location" developed. Persistent insomnia was unaffected by repeated doses of hyoscine and other hypnotics and the patient remained insane for three days. Incontinence of urine was nocturnal only. At the end of the eighth day he seemed to be quite recovered and kept well until the sixteenth day from the rash, when he complained of abdominal pain and again became slightly delirious. Acute appendicitis was diagnosed and a successful operation was followed by a complete recovery. Both ether and chloroform were used for a prolonged anæsthesia (1½ hours), but no further mental symptoms occurred.

CASE 5. *Broncho-pneumonia accompanying the eruption, followed by mental symptoms, tremor, paralysis, and death.*—A male, aged 21, presenting some signs of "giantism," developed a severe measles rash which had faded on the third day, although accompanied by a broncho-pneumonia. On the sixth day following the rash the patient became restless and slightly delirious. These symptoms increased during the following three days, but the chest signs were not serious. On the ninth day following the eruption a very marked restlessness and nervous anxiety as to his own condition developed, although the pulse was good and the bronchitis had diminished, while retention of urine and incontinence of fæces obtained. The delirium increased, and a marked coarse tremor with slight rigidity affected both upper and lower limbs and the jaw. This state persisted for two days, when retraction of the head, absence of both knee-jerks, and well-defined Kernig's sign determined a lumbar puncture, though there was no optic neuritis. The cerebro-spinal fluid was under no increased pressure, and both chemically and microscopically was normal.

The tremor increased considerably, and one or two convulsive seizures occurred before he became unconscious and died of heart failure on the twelfth day following the measles eruption. In this case the temperature never fell below 101° F. from the fourth day of the rash, and remained above 102° thence on till death. After death the rectal temperature was 104·5°.

The autopsy showed a mild broncho-pneumonia, some injection of the grey matter, and slight enlargement of the pituitary body.

Two other cases showing similar symptoms to Case 3 occurred subsequently.

Dr. Charles R. Box and Sir John Broadbent have suggested that these cases should be published to afford some starting point for future workers.

London Fever Hospital, N.

NOTE OF A CASE OF RECOVERY AFTER THROMBOSIS OF THE SUPERIOR VENA CAVA.

By MARY I. HOUNSFIELD, M.R.C.S., L.R.C.P.,
HOUSE PHYSICIAN, ROYAL DEVON AND EXETER HOSPITAL.

THE fact that recovery has taken place renders the following case of interest.

Patient, aged 42, a nurse in an institution, on Feb. 15th, 1917, while on night duty, was suddenly taken ill and vomited twice. She noticed then that her face was very blue. She continued on duty for three nights and then went to bed for three weeks, after which she was admitted to the Royal Devon and Exeter Hospital, Exeter, under the care of Dr. W. Gordon. On admission her face was cyanosed. All the superficial veins of head, neck, and upper part of chest were dilated and engorged. Venules were dilated down to the costal margin. Face, neck, and upper chest were much swollen, but there was no pitting on pressure and no œdema of the eyelids. The swelling gradually subsided with rest in bed, but the veins remain somewhat dilated and cyanosis of the face recurs from time to time. Very marked transient cyanosis after slight exertion on April 14th.

Clinical examination of the chest revealed nothing abnormal, except a localised musical systolic murmur to the right of the lower end of the sternum on admission. This murmur soon disappeared. The right kidney was unusually palpable, abdomen otherwise normal. No enlarged cervical or axillary glands. No tumour of breast. No œdema elsewhere. Urine normal. Blood count normal. A very thorough radioscopic examination of the chest was made early in April, and absolutely no evidence of aneurysm, mediastinal glands, or tumour of any sort could be found.

Examination has thus excluded any cause of external pressure on the superior vena cava, and the only diagnosis possible is some internal obstruction, probably thrombosis. Slight dilatation of the veins still persists, but the patient feels well and is anxious to return to work.

The case is reported by permission of Dr. Gordon.

HOSPITAL SUNDAY FUND AT BRISTOL.—The Hospital Sunday Fund collections in Bristol for 1917 amounted to £3000. This is a record, and the Lord Mayor of Bristol (Dr. Barclay Baron) was congratulated by the members of the committee on the result of his efforts. £2800 have been given to the larger medical charities and the balance allocated to the smaller medical institutions. The Royal Infirmary received £1218, which is more than the whole collection for the first year of the Fund (1899).

JOURNALS.

The Philippine Journal of Science, Section B, Tropical Medicine, Vol. XI., No. 4.—This number contains three articles, the first of which is by Dr. Otto Schöbl, who describes some experiments on the relation between the amount of cholera culture injected into the gall-bladder and the state of cholera carriers in experimental animals. His conclusions are that the inoculation of a relatively small amount of cholera vibrios into the gall-bladder may produce carriers in animals, but the results are not as regular as they are when larger amounts are used for the inoculation; the amount of the inoculated material does not seem to have any direct bearing on the duration of the carrier state in animals according to his experiments. Dr. Schöbl also contributes a short article on the influence of bile upon the duration of the state of cholera carriers in experimental animals. The object of his investigation was to gain information with regard to the relation of cholagogues to the state of cholera carriers, and as a result he found that the increased flow of bile does not further the disappearance of the cholera vibrios from the gall-passages and from the intestine. On the contrary, his experiments "seem strongly to indicate that the administration of bile, a cholagogue *par excellence*, tends to prolong rather than to shorten the duration of the state of cholera carrier." The third article is contributed by Dr. H. Windsor Wade, who discusses Carbohydrate Fermentation by *Bacillus Pestis*, comparing certain American strains from New Orleans and Oriental strains from the Philippine Islands; he gives also an analysis of discrepancies of fermentation with Hiss's serum-water, litmus-agar, and bouillon. Ten strains of *B. pestis* were employed, and comparison failed to demonstrate any distinct difference, qualitative or quantitative, between fermentative activities of Philippine strains and those from New Orleans. There was, on the other hand, a rather remarkable agreement between the different strains except with regard to glycerine fermentation. He found veal-infusion the most suitable medium for carbohydrate fermentation of *B. pestis*. Litmus-agar was more favourable than Hiss's serum-water unmodified, the latter being quite unsuitable. The types of media and the different sugars used had various effects, some of which were very definite and constant, on the amount of growth and on the morphology of the organism.

The British Journal of Ophthalmology, Vol. I., Nos. 4, 5, and 6 (April, May, and June).—These numbers of the *British Journal of Ophthalmology* contain, in three parts, a most important paper on bitemporal hemiopia, the later stages and the special features of the scotoma, by H. M. Traquair. Dr. Traquair has devoted an immense amount of care and attention to the finer details of the scotomata found in cases of bitemporal hemianopia due to involvement of the chiasma and optic tracts, whether caused by disease of the pituitary body or other mechanism. He has mapped out the relative scotomata which are so common in these cases, employing a method of great delicacy, modified by himself from the methods generally in use. Physicians and surgeons alike meet with cases of acromegaly, pituitary disease, and other conditions in which bitemporal hemianopia is a prominent symptom. They cannot afford to ignore this paper, which, in addition to examining the current theories of the mechanism of production of the field defects and providing an excellent bibliography of the subject, adds details of considerable value to our knowledge. Amongst the prominent ophthalmologists who have recently died are Mr. W. H. H. Jessop and Dr. Wendell Reber, of Philadelphia. These numbers contain a biographical notice of the former and an illuminating paper on some phases of modern ocular therapeutics by the latter. Dr. Reber discusses such matters as subconjunctival injections, hormone or organo-therapy, vaccine and serum therapy, and so on. His extensive practical experience and his well-balanced judgment shield him from undue pessimism as well as from excess of enthusiasm. In his own words, he is neither "over-enthusiastic about the qualities of the new, nor iconoclastic regarding the therapeutic ideals of olden days." Other papers which may be mentioned as containing specially helpful material or new facts are those on the Retinal Signs of Arteriosclerosis compared with those due simply to Increased Blood Pressure, by P. C. Bardsley; Three Cases of Fur Infection of the Conjunctiva from Cats, by Arnold Lawson; a New Operation for Ptosis, by Ernest E. Maddox; the Tonometer of Sciötz, by Bernard Cridland. There are other papers of value, and there is a wealth of information in the abstracts derived from ophthalmic literature published elsewhere. An addition is made to the series of British Masters of Ophthalmology in the biography of Benjamin Travers, F.R.S., by Percy Dunn. This paper is illustrated by a portrait.

Military Surgeon.—The June number of this journal gives the first place to a lecture by Colonel T. H. Goodwin, C.M.G., D.S.O., R.A.M.C., on the Collection and Evacuation of Wounded, one of a course of lectures given at the U.S. Army Medical School on the entry of the United States into the war. A paper by Colonel George E. Bushnell, Medical Corps, U.S. Army, on the Diagnosis of Tuberculosis in the Army, dwells on the importance of accurate diagnosis at the present time in the United States when civilian examiners, accustomed to accept as true the statements of patients, have to decide the degree of health of three classes of men: (1) those who suspect they are tuberculous, but are anxious to become soldiers; (2) those who are tuberculous but are anxious to join the Army and secure treatment and pension; (3) those who are not tuberculous but are anxious to evade military service and will allege non-existent symptoms and misleading histories. The paper is long and careful. The writer, who is in charge of a large army sanatorium and has been giving special attention to tuberculosis for several years, seems to feel that, so far as reliance can be placed on a single sign, that sign is the râle—a judgment in which he claims to be supported by German experience during the war.—Lieutenant-Colonel E. L. Munson publishes the first part of the history of an epidemic of measles in a division of 14,000 men in Texas. The epidemic arose from the civil population; its outbreak in the army was foreseen and minimised by careful precaution. Much success was attained; greater could have been achieved had the discipline of the army been better, since "discipline is the mainspring behind sanitation." Colonel Munson was guided in his precautions by his conviction that measles is incorrectly classed as an eruptive fever, whereas it is really a respiratory disease with a rash as a sequela, and he very generally succeeded in isolating patients before the rash appeared. 11,000 well-disciplined and obedient troops showed 105 cases (about 10 per 1000); the other 2400 had 339 cases (about 140 per 1000). To put the same thing in another way, the less well-disciplined troops, had they had the same "luck" as their brethren, should have escaped with 22 cases, but they got 339; while the well-disciplined troops, who might have had some 1500 cases, as compensation for their self-submission to discipline, got off with 105 cases. Their obedience to discipline saved nearly 1500 men from disease and certain of them, no doubt, from death. Other papers evidence the increasing respect for sanitary precautions in the minds of military administrators in the United States, and we note that the time of medical officers is being more and more saved by the assignment to them individually of clerks to do the paper work—in recruiting duty, for example. Attention is prominently drawn to the happy result of the preparedness campaign amongst the medical profession in the United States in recent years. The medical profession there has been doing while others have been talking, and now they are in consequence "first at the front," and were ready to take over, and did actually take over, the management of certain hospitals in France as soon as war was declared—a fact which does them much credit.

MEDICO-PSYCHOLOGICAL ASSOCIATION OF GREAT BRITAIN AND IRELAND.—The seventy-sixth annual meeting of the association will be held on Wednesday, July 25th, at 11, Chandos-street, Cavendish-square, London, W., at 2.45 P.M., Lieutenant-Colonel David G. Thomson, R.A.M.C., presiding. The Educational and Parliamentary committees of the society and the Council will meet on the same day. The following have been recommended for the Research Committee by the Nominations Committee and have been approved by the Council:—T. Stewart Adair, J. Shaw Bolton, J. Chambers, M. A. Collins (*ex-officio*), H. Devine, T. Drapes, E. Goodall, John Keay, J. R. Lord, H. Hayes Newington, David Orr, Ford Robertson, R. G. Rows, R. Percy Smith, R. H. Steen, D. G. Thomson (*ex-officio*), W. J. Tulloch. A paper on Madness and Unsoundness of Mind, by Dr. Mercier, will, in the unavoidable absence of the writer, be read by Sir Bryan Donkin.

Rhéantine is put up in hermetically sealed tins, containing 28 spherules.

Dosage :
Two Spherules
twice a day.

Rhéantine is the Entero-vaccino-therapeutic method in regard to Gonococcic Treatment. Messrs. Lumière and Chrevotier had since 1913 been undertaking a fresh series of experimental and clinical researches with reference to this subject. After considerable difficulties in their endeavour to find a suitable medium for the cultivation of Neisser's diplococcus, they discovered one based on the wort of beer, which perfectly answered to their requirements, and succeeded in preparing desiccated cultures, in vacuo, forming a perfectly anhydrous and stable vaccinal powder, containing about 500 millions bacilli per milligramme. This is administered in keratinised spherules. The clinical effects of Rhéantine on gonorrhœa in its various stages and in the complications of the disease are rapid, well marked, and of the most satisfactory character.

From a paper read before the Therapeutical Society of Paris (14th June, 1916) :—

..... "Under the microscope these successive changes are demonstrated in equally definite stages ; whatever may have been the duration of the disease, the characteristics of the pus become rapidly modified ; after two or three days' treatment the gonococcus, first intracellular, becomes exterior ; it ceases to act as a parasite on the polynuclear leucocytes and the large epithelial cells—one then finds them disseminated outside the leucocytes.

"Finally, some days later, if the administration of Rhéantine is continued, the condition undergoes still further change, the gonococci becomes agglutinated, arranged in a mass, and finally bacteriolysed."

These clinical and bacteriological observations constitute irrefutable proof of the efficacy of antigonococcic bacterio-therapy by the gastro-intestinal tract.

The clinical reports of various doctors, or noted by ourselves, show that antigonococcic bacterio-therapeutics are capable of giving highly satisfactory results both in acute and chronic forms of urethral gonorrhœa and also in the various infectious complications due to Neisser's bacillus.

LITERATURE and CLINICAL REPORTS on REQUEST.

THE ANGLO-FRENCH DRUG CO., Ltd.

THE SCIENTIFIC SULPHUR MEDICATION.

BIOSULFOL

(Assimilable Colloidal Sulphur.)

A GREAT ADVANCE IN SULPHUR TREATMENT.

Sulphur administered in this form by the digestive tract **is entirely absorbed** (90% in worst cases and 100% in others).

Biosulfol gives beneficial results, with which ordinary Sulphur medication, owing to its being only in a small part assimilated, cannot compare.

INDICATIONS :

Skin Diseases.
Chronic Affections of the Pharyngeal and Bronchial Mucous Membrane.
Chronic Affections of the Genital Mucous Membrane.
Chronic Rheumatism (Polyarthritis deformans).
Various Affections of the Joints.
***Intestinal* Intoxication.**
Mercurial and Lead Poisoning, &c.

DOSAGE :

Biosulfol *is prescribed* in a one-teaspoonful dose, to be taken during each of the two principal meals, pure or in water or milk. It is quite palatable.

Medical Treatment of CANCER.

CUPRASE

Cuprase is a colloidal Copper hydroxide which is obtained chemically by the reduction of Salts of Copper in the presence of Albumosic Acid. The numerous clinical reports from Doctors of repute in various countries give cases of a great variety. In all of these **pain has been eliminated,** and in a good percentage **cures are claimed,** and in no instance **any undesirable effects.** Its *easy application* (subcutaneous injections) places it within the reach of all practitioners. It *is not toxic.* Supplied in boxes of 8 ampoules.

Extract from Proceedings of the Royal Society of Medicine, February, 1913.

Dr. George Herschell, comparing electric and chemical colloid copper, stated : "..... **Chemical colloid appears to give the best results.** In the following cases chemically prepared colloid was used. Experimentally it has been proved : (1) That particles of colloid copper can be demonstrated in the granulations of cancerous growths after two or three injections of the colloid ; and clinically (2) **There is invariably great relief from pain ;** (3) Appetite and strength return and the patient puts on flesh ; (4) There is in many cases a diminution in the size of the tumour ; (5) **The injections are absolutely non-toxic,** although in many cases an inflammatory reaction is manifested in the cancerous growths.

"As regards my own personal experience in the use of this method of treatment in addition to my own cases, I have had an opportunity of observing the effects in the practice of some of my medical friends, and in nearly all cases the progress of the disease appeared to be arrested."

LONDON: SATURDAY, JULY 21, 1917.

In the Interest of the War Cripple.

THE number of permanent war cripples was recently estimated by a public servant at 200,000, and their care has entered upon a new phase with the dissolution of the Central War Pensions Statutory Committee and the taking over of its work by the Ministry of Pensions. The country has been divided up into areas for purposes of collective administration and, as usual, Lancashire is well forward with a scheme, which we summarise on p. 99, for a Central Bureau for organising the work of rehabilitation and re-education of the discharged cripple. It is still not clear—perhaps it never will be—how the Ministry of Pensions and the War Office propose to share their various obligations, but the Paris Conference indicated definitely and authoritatively what those obligations are likely to be, and we have now received from our Paris Correspondent the full text of the resolutions passed by this Conference in plenary session, more than 100 in number. The first group of these deals with the restoration of function and the essential recommendations can be summarised as follows: The earlier evacuation of the wounded man into an institute of physio-therapy; the provision of a sufficient number of well-equipped institutes with competent trained personnel; the attachment of an orthopædic surgeon to each field ambulance; the earliest possible application of medical gymnastics. These are the things placed in the forefront of desirability. And it is on lines such as these that permanent impairment of function will be reduced to a minimum by appropriate anticipatory treatment. The remaining resolutions deal more especially with the treatment of any abiding disabilities by re-education, and their wide scope demands close attention. Their purpose—namely, to develop a common policy towards the war cripple among the Allied nations—is worthy of all support.

The possibilities of hope and usefulness opened up to disabled men by the new methods of care and re-education cannot be made too widely known, and we therefore welcome a new and powerful agent in publicity in the shape of a journal, entitled "*Recalled to Life*," edited by Lord CHARNWOOD, of which the first number (June, 1917) has recently appeared. The purpose of this journal is stated to be the diffusion of information among those concerned with the welfare of disabled sailors and soldiers, and not less among the men themselves, concerning the means by which they may be restored. This end will be furthered by a lucid summary of the Treatment of the Disabled from the pen of Sir ALFRED KEOGH, Director-General of the Army Medical Service, prepared for the Anglo-Belgian Committee, and reprinted in this first number of *Recalled to Life*. After an informing historical introduction, Sir ALFRED KEOGH sketches in stages the history of the sick or wounded man who has been declared to be unfit for further military service, going on to deal in detail with curative workshops and with the special problems of the blind and deaf. Accurate knowledge will undoubtedly be the best means of correcting any misconceptions which exist in the minds of the disabled or partially disabled sailors or soldiers with regard to their training. The introduction to the journal records the persistence of the curious belief among the men, prevalent especially in France, that the disablement pension will be taken away from them in proportion to their return to industrial efficiency. Even in Germany this appears not to be the case, and in this country a pension once awarded can never be taken away or diminished. The only fact to be determined on pension revision is whether physical disability has been reduced by treatment; the question of earning capacity does not arise. This is a message which the medical profession should convey clearly to their charges.

Not only can the pension not be taken away, but the disabled man cannot be compelled by the State to learn the trade or to follow the pursuit which will restore him to his highest possible degree of vitality. Only moral suasion can be used for his betterment, and the conviction brought home to the disabled sailor or soldier that he is not less of a man, but more of a man, than he was before the war, unless he decides otherwise himself. Colonel Sir ROBERT JONES, Military Inspector of Orthopædics, who contributes an article in *Recalled to Life* on Orthopædic Surgery and the War, lays great stress on the effect of the curative workshop on the wounded man's mental outlook. In an atmosphere of work, he says, the man who has lost in hospital much of his spirit and initiative soon recovers some hold on himself, ceasing to think so much of himself as a maimed man, but rather of what he will be able to do in the future. That this spirit is not necessarily lost in hospital is testified to by an admirable special number of the *Gazette* of the 3rd London General Hospital, entitled "Happy—though Wounded!" edited by Lieutenant-Corporal WARD MUIR, R.A.M.C., and brimful of humour. The Editor tells us that one of the most amusing articles was penned by a sergeant just before undergoing an operation which he knew might be fatal. This is typical of the spirit which is common to all the fighting forces, and is the material on which medical care and re-education will not be brought to bear in vain. It is the duty of the country to reward this gallant spirit by striving in every way to help in the rehabilitation of our heroes. The medical profession, which has learned vast new lessons in the course of the war, is restoring to our population thousands who, a generation ago, must have been doomed to hopeless, helpless crippledom; adequate organisation for giving to these men the chance of using their recovered faculties must be forthcoming.

The Medical Recruiting Boards.

WE have published from week to week the evidence given before the Select Committee of the House of Commons which is holding an inquiry into the working of the Military Service (Review of Exceptions) Act, an inquiry which has largely become an examination of the methods pursued by medical boards towards recruits. Among the most valuable evidence given must be accounted that of Colonel Sir JOHN BLAND-SUTTON as to the work of the Special Medical Board, whose function it is to examine cases where differences of opinion have existed between medical recruiting boards on the one hand and private medical advisers of the recruit on the other. The points of view being largely if not wholly different, it is not surprising that the verdicts should not always agree. Speaking generally, Sir JOHN BLAND-SUTTON considered that the proportion of cases in which classifications had to be lowered by the Special Medical Board was too large, which certainly points to over-ruling by the military boards of the opinion of private practitioners. This is, though put in more reasonable form, the opinion which has been widely expressed by the public, for many of the indignant complaints to Members of Parliament, specimens of which have been ventilated in debates, show that the decisions of certain of the medical boards have been formed too hurriedly, although free from the peremptory callousness or widespread ignorance which some have imagined to exist. That the official desire to secure, at any rate for garrison duty abroad, many men who were obviously not of sufficiently good physique for general service has had fuller interpretation than was safe will be admitted by all, but whether this is a fair estimate of the amount of mischief done we doubt. As far as possible, precautions will be taken against the recurrence of abuses, while the constitution of the boards is now under official consideration.

An extraordinary estimate of the value of medical boards is suggested by the military attitude. Evidence has been given, and documents have been produced, which go far to suggest that in the eyes of the military authorities classification is of no particular service, for everybody has his uses of some sort or another in the Army, while classification can be readjusted, they believe with safety, to meet all emergencies. That is the curious position which seems to have been reached, and some military medical officials would readily find that the duty of a medical board is to interpret the view of the War Office that every man has a value in the Army, now that every form of civilian employment has its analogue with the colours. The broad acceptance of this view would be to reduce medical examination to an empty formula. At all events, the examination would merely give opportunity for the registering of a medical opinion whether an individual man could do better work, either of his own special sort or other sort, in a uniform and under Army regulations, or under civilian conditions which are now so much modified by military exigencies. That national service should be rendered is the view of us all, but when we find the sentiment growing up that, short of the grossest disabilities, such service can be rendered by men with real physical defects, we are bound to protest that extra risks will be constantly incurred both by the military employer and the militarily employed if this sentiment is allowed full sway. We disagree with the view that there is no difference between the strain of work done under private conditions and the same or similar work done in accordance with official routine; in private employment there is a flexibility of conditions that may be of the greatest benefit to the seriously unsound; and in keeping such persons out of military employ the medical boards should be of great service, though their more urgent duty is to see that the call to arms is fairly obeyed by the nation as a whole.

There is no doubt that the medical boards in some commands have tended to be better than those in others, and the discrepancies that have appeared in the numbers of rejections show that varying standards have been used; so that it is not surprising that considerable difference of opinion as to what generally takes place at the tribunals has been expressed before the Parliamentary Commission. It did not emerge with any great clearness from the statement of various witnesses as to how far it was the rule for the actions of the boards to be dictated by the chairman. That this usually happens has been strenuously denied both officially and by individual members of these boards, yet it seems to us probable that the chairman generally has had more voice than any member. It is difficult to see how it could have been otherwise, for a medical board being a form of committee, the chairman is certain to possess considerable influence over its members. Unfortunately it seems that on some of the medical boards the chairman has employed that influence purely in military directions, and it is for this reason that we welcome the fact that the constitution of the boards, although their work has of late much improved, is marked for considerable reform. The personnel of many of the boards will be reviewed especially with a view to a proper selection of local medical men for membership of the boards. We regard the frank nature of the evidence given before the Select Committee as of good omen, although its nature has been somewhat disquieting. The public, as well as the medical profession, have been able to get a well-balanced idea of the situation, and that is worth having. This war is being slowly won by the determination of the country to face the inevitable and innumerable hardships that must be suffered by the people. When there is comprehension, quickly or slowly confidence is restored, for events assume their right proportion, and the remedy for errors can be directed by deliberate reason.

Annotations.

"Ne quid nimis."

WAR EMERGENCY FUND OF THE ROYAL MEDICAL BENEVOLENT FUND.

THERE will be found in our advertisement columns the first list of the donations received for the War Emergency Fund of the Royal Medical Benevolent Fund. It is an imposing list and a practical proof of the ready generosity of the medical profession towards their fellows. We regard it as a promise for a creditable total when the Fund comes to be closed; but we must remind our readers that at present the sum obtained is quite inadequate for the purpose which the founders of the Fund have placed before the medical profession, and through them before the public. It is now nearly a year since an appeal was made by the office-bearers of the Royal Medical Benevolent Fund for support to a special emergency fund to assist medical men in temporary difficulty in consequence of having joined the Army Medical Service. A ready response was given to this appeal, enabling the Fund to deal with a number of urgent cases where help was needed, and to render in some of them more substantial assistance. By coöperating with other benevolent societies, such as the Officers' Families Fund and the Professional Classes War Relief Council, any possible overlapping of effort has been avoided. As time goes on the need has, unfortunately, become greater, and in a letter from the President, Treasurer, and Secretary of the Royal Medical Benevolent Fund, which appeared in THE LANCET on June 16th, an appeal was made for a much larger sum than was obtained last year. The letter called attention to the following obvious facts. Many members of our profession, in consequence of having joined the Army Medical Service, find themselves in temporary difficulties. Many medical men when called up had to leave on very short notice, without time to make adequate provision for the carrying-on of their practices during their absence. They have had severe losses in income even when supplemented by Army pay, while heavy expenses, such as rent, insurance, taxes, family maintenance, and education, could not be reduced. To meet these needs, which it is hoped will in many cases be only temporary, the War Emergency Fund was established. To be effective, said the letter from Dr. Samuel West, Colonel Charters Symonds, and Major Newton Pitt, the grants must be made on a liberal scale, and the fund from which they are to be drawn must be a large one. The sum obtained last year was about £4000. This is quite inadequate, as at least £25,000 will be required, even if a small proportion of those requiring assistance is to be helped. From the wealthier members of the medical profession, it is hoped, substantial sums will be received, but everyone will feel it a duty which he owes to his less prosperous colleagues to give the most liberal donation he can afford. The sum mentioned should be forthcoming, whether from within or without the profession. The demands made on the medical man at the present time are searching and imperious; he is recognised as being more essential than ever to the community, and it is only fair that his work should not be hampered by mental anxiety for his own financial position, or that of his family if he is killed or disabled. The appeal is not, and ought not to be, restricted to the medical profession, and this is the view which any medical man who is in touch with influential patients might well bring before them. It should be added that the War Emergency Fund is a special department of the Royal Medical Benevolent Fund. It is kept separate and distinct from the ordinary operations of the general fund and is under the management of a committee specially appointed for the purpose. Communications should be addressed to the Honorary Secretary, War Emergency Fund (Major G. Newton Pitt), 11, Chandos-street, Cavendish-square, W. 1, to whom cheques should be made payable.

FARM COLONIES FOR THE TUBERCULOUS.

THE spes phthisica, with which the tuberculous patient is often unjustly credited, springs eternal in the breast of those who make long plans for his recovery undaunted by the discouragements which dog the path of men of shorter vision. The well-ordered daily discipline first put into practice by Brehmer, of Görbersdorf; the re-discovery of the value of fresh air in season and out of season by Walther, of Nordrach; the system of graduated and progressive labour of which we owe the beginnings to Dr. M. S. Paterson, among others—all these still retain the confidence of the far-seeing tuberculosis expert who has not been misled into attaching undue importance to some particular phase of treatment which may at the time have captured the popular imagination. There are those who would scrap the whole of our present sanatorium system of tuberculosis because a weaver or a coal-miner after three or four months of such treatment frequently relapses upon returning to his previous conditions of life. Not so the prophet who is also the practical administrator. On the experience and lessons of the past he builds his superstructure of developing ideas. In an address commending the farm colony to the National Association for the Prevention of Consumption, at its recent annual meeting, as the most hopeful solution of the problems of tuberculosis administration, Lieutenant-Colonel Sims Woodhead was careful to describe his scheme as one link in a chain, many of whose other elements had been previously forged. His general conception of the farm colony is a comprehensive one, requiring essentially a large tract of land given over to various forms of profitable cultivation, including a generous plan of allotment for intensive culture. Colonel Woodhead regards the teaching of minor handicraft as an essential part of the scheme, in order to fit the recovering patient for emigration to one of the colonies in which he would then start with the means of livelihood. On the plan already adopted in Norway and Italy he places in the colony a "fever rest-house," combining rigid open-air treatment with the comfort of a hospital for the febrile interludes of the chronic consumptive, using it also for the old stagers who are thus deprived of the sense of being shut up in a home for the moribund. The Cambridge After-Care Association is fortunate in having such a model labour colony already in working, and in having wrested from the Approved Societies a concession in regard to sickness benefit to which we have more than once called attention, and which is being tried there with a view of introduction on a larger scale elsewhere if successful. A happy sequel to the address was given by Sir A. Griffith-Boscawen's assurance on behalf of the Ministry

of Pensions that abundant funds would be available for the re-education for industrial life of discharged tuberculous soldiers in such farm colonies, if the Ministry became satisfied that the farm colony was the best method of dealing with them. Lord Glenconner pressed upon the National Association the desirability of running for themselves a small model farm as an object-lesson of what such a curative institution should be.

THE RÔLE OF OPHTHALMOLOGY IN THE STATE.

AN editorial article in the July number of the *British Journal of Ophthalmology* suggests the advisability of a closer contact between ophthalmology and the wider interests of life. Those who devote their careers to it have tended to regard ophthalmology as a preserve to be jealously guarded, where trespassers will be prosecuted; they themselves seldom invade neighbouring territories. Both invader and invaded would, he thinks, be all the better for a freer intercourse. The most comprehensive problem with which the ophthalmologist has to deal is that of natural and artificial lighting in domestic, public, and industrial activities, but it has been left for illuminating engineers to invite ophthalmologists to show their interest in it. Lighting problems teem with difficulties which can be satisfactorily overcome only with the coöperation of properly equipped ophthalmologists. They can also help to solve the numerous questions relating to colour—colour matching by artificial light, the best colours for signal lamps, and so on—all of which involve a knowledge of physiological processes and colour vision. Pathological problems also await solution. Some years ago the Royal Society undertook, at the request of the Government, to investigate the cause and possibility of prevention of glass workers' cataract. These researches extended our knowledge of the physiological and pathological action of heat, light, and ultra-violet rays upon the various structures of the eye, and led directly to the synthetic preparation of glasses of various absorptive properties by Sir William Crookes. Years ago the War Office approached the Ophthalmological Society on the subject of tests of visual acuity for officers of the Army. What is the minimum visual acuity necessary for an airman, an artillery officer, an infantry officer, a private, a munition worker, and others? What guide does a standard in terms of Snellen's test types bear to the actual requirements of these men in their various duties? The article concludes that these and innumerable other such questions await an answer which can only be given by expert ophthalmologists, and then only after much travail of body and mind. It is futile to wait for the authorities to ask these questions. Reform can only come by the spontaneous effort of the ophthalmologist himself.

ANKYLOSTOMIASIS IN SOUTHERN INDIA.

LARGELY in response to representations made by the International Health Commission of the Rockfeller Institute, the Indian Research Fund Association are at present devoting a considerable amount of attention to the subject of ankylostomiasis in India, and two detailed investigations have already been made. The first of these inquiries was carried out by Lieutenant-Colonel Clayton Lane, I.M.S., among the coolies employed in the tea-gardens of the Darjeeling district, Assam, and his report was published in the *Indian Journal of Medical Research* (vol. iv., No. 3), to which we directed the attention of our readers in THE LANCET of May 19th. The second investigation was undertaken in the Nagapatam district of the Madras Presidency by Dr. K. S. Mhaskar, whose inquiry was chiefly made respecting the presence of hookworm infection among the coolies collected at the emigration depôt at Nagapatam; his report is now published in the last issued number of the *Indian Journal of Medical Research* (vol. iv., No. 4). The procedure he followed was somewhat similar to that employed by Colonel Clayton Lane. In addition to examining the coolies collected at the emigration depôt, he examined also hospital patients, school children, and other persons in the town of Nagapatam. The native portion of this town differs but little in character from an Indian village, none of the inhabitants, even those who are well-to-do, showing any inclination to improve the sanitary state of their surroundings. Dr. Mhaskar, in this connexion, observes that in this part of India many of the towns are in fact little more than collections of villages "deprived of the amenities of village life." He adds that the sanitary index of Nagapatam, so far as latrines and excrement disposal are concerned, is "zero." There is an almost universal practice among the male inhabitants of the small towns and villages in this locality to go outside to any unoccupied piece of land to defæcate; women and children use for the same purpose the backyards, or a small enclosure set apart, open to wind and rain, and accessible to fowls and pigs, which scatter the excrement over the surface of the ground where it cannot fail to be trodden upon. It is noteworthy that persons who wear shoes are found, on the whole, less infected by hookworms than those who go about barefoot. In Nagapatam town 91 per cent. of the stools examined contained ova of the ankylostome worm. There is no reason to suppose that Nagapatam is either better or worse in this respect than other towns and adjacent districts in Southern India. In 67 samples of children's stools obtained from schools in Nagapatam hookworm ova were found to be present in all but one. As regards the coolies at the emigration depôt they are collected from 13 districts and 4 native States of the Madras Presidency, and 98 per cent. of them were found to harbour ankylostome worms. The physical condition of these coolies, who were more or less a selected class, demonstrates that hookworm infection is not incompatible with apparent good health. It would seem from Dr. Mhaskar's investigations that ankylostomiasis is endemic in this part of India and that it is far more prevalent in the Madras Presidency than the published hospital and dispensary returns would appear to indicate. The prevailing variety of hookworm found in this part of India is, as in Assam, *Necator americanus*, although occasionally *Ankylostoma duodenale* is also discovered.

Surgeon-General Sir George H. Makins, K.C.M.G., C.B., surgeon to St. Thomas's Hospital, has been elected President of the Royal College of Surgeons of England.

THERE appeared in certain journals about a fortnight ago a letter from Sir Victor Horsley to Lieutenant-Colonel R. M. Carter. The letter was a strictly private one, but its contents were disclosed at the recent Government inquiry into Mesopotamian affairs. Neither the original document nor a copy of it was sent to any journal for publication, while the version which has appeared is incorrect.

THE PARIS CONFERENCE ON THE WAR CRIPPLE.

IN THE LANCET of May 19th we gave a report of the several sections of the Conférence Interalliée pour l'Étude de la Rééducation Professionnelle et des Questions qui intéressent les Invalides de la Guerre, which was held in Paris from May 8th–12th. On the penultimate day of the session the resolutions on which the sections of the Conference had agreed separately were reviewed in a combined sitting. The text of these resolutions has now been issued, and the following is a deliberately literal translation of them :—

Functional Restoration and Medical G mnastics.

1. To instruct the surgeons to evacuate much sooner the wounded into the institutes of physiotherapy, without awaiting the "irremediable" cicatrisation of the lesions.

2. To create well-equipped surgical services in the institutes of physiotherapy, so as to permit the surgeons at the front to send the wounded there promptly.

3. To place a competent medical physiotherapeutist as consultant in the sanitary formations at the front.

4. Medical gymnastics should only be practised by a competent personnel (doctors, medical gymnasts, medical students, and so on).

5. To apply medical gymnastics as soon as possible to the wounded. To place some medical gymnasts in the large surgical hospitals at the front, where they will render more service than mere mechanotherapy.

6. To admit in the institutes of mechanotherapy as assistants or auxiliaries only competent persons acquainted with the principles and the practice of rational physical re-education.

7. Pedagogic gymnastics or collective motor re-education should be directed by teachers of gymnastics instructed and closely supervised by a medical physiotherapeutist.

8. To provide in all the countries for the creation of centres of university instruction in medical gymnastics.

Functional Restoration by Work.

9. The schools of functional restoration shall be placed under the sole direction of the Service de Santé.

10. Physical re-education (whether massage, gymnastics, mechanotherapy, manual work) should be confided solely to competent persons, and should not be confounded with occupational re-education, which applies to the invalided only, and not to the wounded before being invalided.

11. The work prescribed as adjuvant to physiotherapeutic treatment should be obligatory in the institutes of physiotherapy.

12. Treatment by agricultural work, which is the most frequent treatment, owing to the large number of wounded agriculturists and like workers, cannot be organised according to the same formula in diverse regions; the greatest attention should be paid in this organisation to the local modes of cultivation. The mode of cultivation regulates, in effect, the quality and the number of workers utilisable in a given area. Any organisation which does not take into account these regional considerations is doomed to most regrettable non-success, alike from the point of view of the cure of the wounded and of the work furnished to the nation.

13. Occupational work can be considered as an adjuvant of physiotherapeutic treatment, but on the express condition that it be in each case chosen by the doctor and that its execution be supervised as closely as possible by him.

14. That the invalided man submitted to a medical treatment in a hospital be admitted into a workshop of occupational re-education only on condition of being able to dispose of a sufficient number of hours to learn or relearn an occupation with utility. He should, it must be understood, present himself furnished with the medical authorisation.

Prosthesis and Mechanical Adjuvants of the Re-education.

15. It is advisable to encourage the scientific study of the prosthesis of limbs.

16. It is advisable systematically to forbid the employment of crutches in the treatment of amputations of the inferior limb.

17. Functional apparatus of prosthesis, osteo-articular and musculo-nervous, should be delivered only after minute examination, clinical, electric, and ergographic, made by competent doctors. For this there are several reasons: first, some cripples are insistent in asking for apparatus of which they have no need in order to take up again their work. Orthopædists have a tendency to give prostheses which often go counter to the end in view. In short, apparatus badly constructed, far from aiding the wounded, are injurious and hinder occupational re-education.

18. The prostheses of work, in regard to the arm or forearm after amputation, should satisfy these prime conditions: they should be simple, strong though light, easy to repair. Also well applied, making so to say one with the stump. They should be for the amputated, in the course of work, not an object of trouble or fatigue, but a precious auxiliary.

19. All our efforts should tend to perfect the mechanical helps to re-apprenticeship, of which some do not yet respond to the end sought. New advances will certainly soon see the light of day and we shall put all the wounded, to whom we have restored the inclination to work, in a position to earn a wage assuring a sufficiency for them and their family. So shall we contribute to the economic renewal of life.

20. We think that there will be occasion to adapt almost for each occupation a special working hand provided with the necessary tools. In a word, it will be advisable to individualise the hands of work.

21. On account of the interest existing in the perfecting of the apparatus of mechanical orthopædics and of the aids in re-apprenticeship, and in order to permit the grouping and utilisation of the projects of study, it is desirable that an organisation of researches be instituted in each allied country. In order to bring together the necessary experts it would be desirable for it to consist of medical specialists, engineers, technicians, and mutilated fitted with apparatus.

22. An Interallied Commission should without delay be constituted to examine all that relates to prosthesis. In this commission all the experts—i.e., surgeons, orthopædic surgeons, technicians, and, in a consultative capacity, manufacturers—should find a place.

Pensions and Gratuities.

23. That the laws on military pensions be revised, taking into account not only the physical incapacity of the invalided man but the number of children, the family charges, and the parents.

24. That particular cases should be made the object of special study, so that the injury caused may be repaired with proper regard for the previous situation and the possible situation depending on the invalidity.

Occupational Guidance.

25. That civil technical advisers be appointed at once, with the mission of giving to invalided soldiers, during their medical treatment and before their occupational re-education or their discharge, advice on their future—i.e., on the advantages presented, according to the particular case, in persevering in former work or choosing a new kind of work, and, if so, what kind. The intimate collaboration of the doctors and the occupational guides is indispensable in realising a complete re-education. It is also indispensable for guiding the maimed man and for directing him from the beginning of his re-education. But this guidance should never be forced, the good will of the subject being an essential factor for success. The re-education should follow without interruption the medical treatment, and even overlap it.

26. In view of his vocational guidance, the man will receive the advice of experts—medical, pedagogic, technical, and social. The wounded will be fully interrogated on their knowledge, previous occupation, tastes and aptitudes, their family responsibilities, eventual projects for the future, and their economic position. The man, after having visited various workshops to fix his ideas, will choose himself his new vocation. He will, in case of need, be guided by his advisers, notably by the medical man, who will judge if the exercise of the chosen work is compatible with the physical state of the subject.

27. The advisers will endeavour to interest each man in his new occupation by showing him in a concrete manner the possibility of establishing himself in a certain place and the hopes of success. The man, having definitely decided, will be admitted into the chosen workshop. If after a short period of trial he shows the desired aptitude he will be maintained there. Without that he will again appear before his advisers.

28. The advisers will be inspired, as far as possible, by the following principles. It is necessary, unless contrary to the interest of the cripple, to re-educate him in his former work or in a connected occupation. As far as possible the man should be returned to his previous work, notably as to agriculture, and if possible in a superior technical position. But only those cripples should be directed towards non-manual occupations who are educated and have shown sufficient intellectual aptitude in a preliminary examination. It is necessary to make an artisan rather than a factory worker, not to direct men towards encumbered occupations, but towards the vocations where workers are rarest.

29. It is proper to keep, as far as possible, war invalids in their previous occupational environment.

30. It is proper to keep the invalided men, in each case where possible, in the region where they resided before the war.

31. The crippled should be guided in choice of occupation by the extent of openings and the facility of obtaining situations.

32. That for the inmates of hospitals and absolute invalids there be left certain minor kinds of work which can be occupation, but will never be trades.

33. That the trades destined for the new apprentices be chosen from those which can be exercised profitably in less than a year.

34. That, speaking generally, before seeking for the invalided a new occupation, the most serious efforts be made to furnish the man with all the information calculated to re-adapt him for his former work.

Occupational Re-education.

35. The Conference is of opinion that only obligatory re-education can entirely solve the problem. But considering that this obligation encounters in certain countries resistances difficult to overcome immediately, it expresses the wish that public authorities will promote occupational re-education and the retaking up of work by all appropriate means.

36. All the wounded and unfit, victims of the war, unable to be re-educated during the hostilities, have a right to occupational re-education.

37. In absence of obligation competent persons shall be delegated by the State to lead those concerned to make use of this right.

38. During the period of re-education, besides the pension and maintenance allowance, the premiums of apprenticeship will be paid and the remuneration will be continued to those entitled thereto.

39. The State will grant subventions to private institutions which submit to its control and which are organised to assure perfect re-education, and will maintain or create as many schools of re-education as will be necessary.

40. The wounded and maimed who have accepted re-education and who have endeavoured to re-adapt and perfect themselves voluntarily, making a praiseworthy supplementary effort and augmenting their social value, have the right, as officially declared on many occasions by the public authorities, to the whole of their gratuity or pension. It will be desirable, also, to ask the State, so as to encourage re-education, to assist the re-educated wounded and maimed by various advantages, such as money prizes, loans, facilities for starting business, &c., in recognition of their good will and of their desire to take again, in spite of their disability, an active place in society.

41. On account of the constancy of the psychic factor in all the questions inherent in the occupational re-education of the invalids of war, it is necessary in the re-education to unite psychotherapy with physiotherapy, and to recognise the psychotherapeutic importance of occupational work.

42. Occupational re-education should be conceived in a broad, scientific, and humane spirit. It cannot be entrusted to incompetent persons. It comprises general instruction and education, as well as technology. It aims at improving the physical and moral state of the invalid.

43. The re-education of the wounded comprises two periods: (1) The period of functional restoration by work with the object of curing the

wounded, preparing their instruction, and inducing them to work. (2) The period of occupational re-education which begins when the lesions are consolidated, and aims at the moral, intellectual, and manual training of the mutilated. The intellectual training comprises general education and occupational technical instruction, of which the programme can be summarised in the following points: tools, raw materials, processes of manufacture, cost price and sale of manufactured articles, scheme of application. For the manual training it is necessary to banish from the instruction all empirical methods and not to linger over the elementary practices of workshops, but to initiate the apprentices in modern and rapid procedures.

44. In the regions where a local industry exists schools of apprenticeship should be erected destined for the invalids of the district.

45. The schools of occupational re-education should be placed under the chief direction of a committee composed of doctors, representatives of syndicates of workers and employers, technical workers, sociologists, members of various educative bodies, mutilated men who have been re-educated.

46. Each director of a school should make it a point of honour to keep the students with him only so long as is strictly needed for their apprenticeship, and should try, as soon as this is sufficient, to return his pupils to normal life by finding them places in their new work.

47. It is desirable that periodical reunions should permit, in each region, a regular exchange of views between the chief doctor of the centre of appliances and of re-education of the region and the directors of the schools of re-education, public and private, so as to be able to co-ordinate their efforts with the view of directing from the outset the mutilated man in the occupation best adapted to his lesion and to his former work.

48. That the competent regional organisations collect, for the use of the invalids already discharged, information indicating the workers wanted in each region.

49. That the results of the statistical inquiries of the Ministries of Labour, relating to the workers required, be rapidly communicated to the direction of the various schools of occupational re-education.

50. (*a*) That the heads of industry, of trades, of employment, collaborating with, in case of need, competent persons such as doctors, psychologists, technicians, and so on, be invited to define, with all desirable precision, the aptitudes particularly required in the various orders of work in their enterprises (specialisation, synergies, strength, address, frequency and rapidity of movements, sensorial aptitudes, intellectual faculties, &c.) That they be invited also to describe the nature of the preponderant fatigue or of the associated fatigues (muscular, nervous, sensorial, intellectual) caused by the various forms of work of their employees. (*b*) That the documents thus collected be centralised and classified, with the view of forming a series of monographs on trades, occupations, and employments, enabling individuals to turn to the careers according to their health and aptitudes. (*c*) That besides the medical card index there be established (according to the methods of physiology and psychology) a card index of the aptitudes, motor, sensorial, and intellectual, of the emotivity, habitudes and tastes, of the degree of instruction, working capacities, of the re-educable, and these cards could be communicated (without indication, at first, of the names of the subjects) to the heads of businesses for the recruitment of their personnel.

51. That the mutilated, amputated or not, if he has good will, is assured of the zealous help of the head of the workshop and of the medical specialist. This triple collaboration will contribute, in many cases, to the creation of appropriate tools or to the modification of machine tools, susceptible, in both cases, of realising the maximum of industrial output.

52. The schools of re-education, speaking generally, should be organised on a large scale, with a great number of pupils, able to choose between a variety of occupations or of kinds of instruction. One can thus distribute the pupils in a rational way, have good masters and good heads of workshops, with all the necessary equipment for instruction and for the running of the workshops. Nevertheless, it should not be overlooked that small schools have their utility in maintaining in their place of origin the invalided who do not desire to go away, and in facilitating apprenticeship in certain special industries.

53. A school of re-education should be as far as possible attached to a large hospital. There will also be centres of neurology, physiotherapy, and apparatus.

54. Commercial and administrative courses will be instituted in each college or each superior occupational school, established near a hospital centre or a centre of discharge, in order that the candidates for this kind of education do not lose the precious time elapsing between the commencement of convalescence and their discharge.

55. That the schools of apprenticeship of wounded soldiers, particularised industries established for instruction in diverse sections of occupations, be not considered by the authorities as works of public charity, but indeed as institutions of technical instruction.

56. After, as during, the war the certificates at the end of the apprenticeship will be given by industrial commissions composed of delegates of employers and of delegates of workers chosen from among the re-educated mutilated.

The Finding of Employment.

57. There is no ground for creating in the industrial establishments for the generality of cases special workshops for men invalided by war.

58. The invalided by war should receive for an equal production a salary equal to that of the sound worker. In any case the pensions allowed by law to the invalided by war cannot be a cause of diminution of the pay which is generally given in the same region, and for the same work, to the sound workers.

59. In a general way the finding of posts for the invalided by war will be confided to the organisations legally charged with the placing of sound workers, and there is no need to separate agriculture from general employment. Where the direct placing is exercised by the occupational schools as concerns their pupils or by the local committees and other bodies as concerns their protégés, these bureaux should be coördinated with the public employment offices, which should be informed regularly of the operations effected. There is advantage in the schools of occupational re-education continuing to place their pupils, but not without having, as a preliminary, consulted the departmental committee of the place of origin of the mutilated, in view of his return there.

60. The public and private employment services should apply to the invalided by war, beyond the general rules of placing of sound workers, rules which are stricter, notably as concerns the steadiness of employment, the conditions of work, and the scale of salary, as well as accessory advantages. There is need to guide the regional placing of the invalided by war by establishing a general list of the trades required by each region.

61. There is obligation for employers to give occupation, whenever it is possible, to the invalided by war.

62. That the formal contracts impose on the administrations a percentage of re-educated or re-adapted mutilated men.

63. That the regulations of the examinations in the public services be revised so as to permit the wounded in war to profit by the advantages which are offered, and that the preparation for these examinations be facilitated for them.

64. (*a*) That the organisation of coöperative societies in production and of agricultural coöperative societies be promoted. (*b*) That motive power and special machines be put at the disposition of the mutilated working at home who express a desire for them. (*c*) That a bank for loans be organised for those who on mobilisation found themselves faced with a situation to restore, whether in regard to a business, a public office, or an agricultural undertaking. (*d*) That the labour market be organised.

65. That the facilities of credit given to agriculturists be extended to the invalided artisans for purchase of tools, and that help be provided to small trading, either by capitalisation of a part of the pension or by special banks.

66. That the Allied Governments study the institution of the Crédit Mobilier (loan society on personal property) for mutilated and discharged men, with a view of permitting the invalided by war, and specially those who have been re-educated, to acquire the instruments of work and the raw material necessary to become small masters.

Agricultural Re-education and Employment.

67. Return to the land appears more and more desirable for most of the war invalids, in particular for all the wounded with nervous affections, even in certain cases for the most infirm of the nervous system.

68. That while fully respecting the liberty of the individual, endeavours should be made to lead back to the land all the agriculturists wounded and mutilated.

69. Men who may be discharged should be dealt with while they are under military control and grouped together; it is inadvisable to wait till the discharged men have returned to civil life and dispersed.

70. That the retaking up of agricultural work be logically presented to the wounded and applied as a complementary form of physical treatment.

71. That the mutilated agriculturists be returned to the land as soon as possible and do not await, inactive, in a medical centre, the settlement of the pension or the organisation.

72. That former agriculturists be directed, only in exceptional cases, towards occupational re-education and when they cannot return to the land.

73. That advantage be taken of their stay of some months in a centre of treatment in their place of origin by renewing their occupational education.

74. That a definite course of instruction, simple and practical, be organised, so as to bring within reach, in the speciality chosen, the knowledge necessary to become an agriculturist capable of developing and of perfecting his knowledge.

75. That the Ministries of Agriculture and all the agricultural authorities organise this course of instruction with the materials at their disposal.

76. That relations be established as intimate as possible between the schools of re-education and the Ministry of Agriculture so as to realise this programme with the briefest delay and in the best national interest.

77. Independently of the special schools devoted exclusively to agricultural re-education it would be desirable to see instituted, whenever possible, in the gardens surrounding the occupational schools, a practical course of instruction in intensive cultivation, arboriculture, and small holdings for the use of the artisans following their trade courses, as well as lectures at which the courses, given outside the hours of occupational instruction, would impart indispensable theoretic and scientific knowledge.

78. That there be organised, in support of agricultural re-education, an active propaganda, not only among the wounded, but especially among the institutions of re-education and placing of the mutilated, municipalities and teachers of rural communes, so that conclusive observations on the re-educated mutilated may be recorded, and, if possible, illustrated by photographs. The danger will be shown of the immediate placing of agriculturists in public or private employment and the capital interest there is, as much from the social as the individual point of view, in leaving agriculturists on the land and in perfecting their agricultural education.

79. That in order to maintain the peasant on the land and to cause the mutilated to return there, the owners be invited to interest themselves more in their properties, and after advice from competent persons to introduce on their farms the improvements indispensable to ensure a good and remunerative cultivation.

80. That the workers occupied in agriculture benefit on the same grounds as the workers employed in industries by the advantages accorded by legislation relative to industrial accidents.

81. That as rapidly as possible measures be taken to permit the mutilated to acquire land. And that notably the right be given to a military pensioner to apply a part of his pension to form a capital sum devoted, under the supervision of a competent authority, to the acquisition of land and agricultural equipment.

82. That the Ministries of Agriculture organise rural centres of instruction in local small industries, and also create associations which will assure to the workers the normal wages accepted by the Ministries of Labour.

83. That the public services be reserved only for the mutilated incapable of taking up again usefully agricultural work: amputated or paralysed in two members, upper or lower, blind, &c.

Permanent Protection.

84. That societies, assisted and instructed by the central organisations of propaganda and documentation, cöoperate with the State, the Societies of Mutual Aid, and the occupational groupings for the permanent protection of the invalided by war, on all occasions where this protection should be exercised, from the day of receipt of wound.

85. That the Allied nations, as soon as possible, enter into conventions tending to fix the régime applying to war invalids, so that the latter can find protection and assistance, on the same ground as the indigenous, in any foreign country where they exercise, even temporarily, their callings.

86. To assure complete and permanent assistance for the absolute invalids.

The Care of the Blinded.

87. (a) *Pre-re-education.*—The creation of small workshops near the ophthalmological centres and the ophthalmological services of the hospitals should be rendered obligatory. It will not be enough in these small workshops to commence, as soon as the state of the wounded man permits, the occupational re-education; the principal task is that of facilitating for the blinded man the passage from his previous life to his new condition. We must shield him from all maladroit and depressing pity. We must take care that the revelation of his blindness be made with all the precautions that are required by his sensibility and physical state. We must seek to maintain and develop his relations with his family, either in facilitating their visits or in giving the blinded man the greatest facilities to be with his relatives as much, be it understood, as his state and the needs of medical treatment will permit. A beginning will be made by teaching him Braille. He must be given the means of entering into relation with the world as much by the processes of writing in black as by the method of typhlography Cantonnet which deserves to be adopted. If he has become another man he is not necessarily a worse man, and he must understand that he will be able to assure himself, by his work, a new existence in which he will find the means of re-making a new life, worthy, active, and happy. We must take care that he does not allow himself to be drawn into a marriage towards which his fiancée would be urged only by pity or interest. In short, we must have constantly in mind that the duty of the educator is to concern himself much less with procuring an immediate satisfaction than with assuring the future of the injured man.

88. (b) *Re-education.*—The blinded, as soon as their state permits, will be directed to the school of re-education nearest their home, and will not, under any pretext, be retained at the ophthalmological centre or service beyond the limits strictly indispensable for the treatment of their wounds. The directors of the schools will apply themselves to following the precepts enunciated above. At the school one will seek for each blinded man instruction in the kinds of work which seem best adapted to his condition, knowledge, and aptitudes. A difference will be made between the town dweller, whose apprenticeship should be pushed to the possible limits of perfection, and the countryman who, living more cheaply and being able to occupy himself with small works of cultivation still open to him, will only have need of adding to his pension the money coming from supplementary work, such as, for example, brush-making, chair-making, basket work, shoe-making, for which he will find clients in his immediate vicinity. The Conference voted the resolution that the "typhlophiles" devote their efforts to searching for lucrative occupations able to be exercised by the blind with a superior education: clerks, students, officiers de carrière, &c. Before the departure of each pupil the school directors will instruct families as to the moral and material aid necessary for the blinded.

89. (c) *Return home.*—The Conference adopts the resolution that the improvement promised in the actual pension of the blinded in war by raising the scales fixed by the law of 1831 should be realised with the briefest delay; that account should be taken of multiple infirmities and family charges, present and to come; that this increase be not paid by the State under the denomination of relief; and that all the wounded, without distinction of grade, should be entitled to benefit in the proportions indicated by the scale of pensions. On leaving the school each blinded man—peasant, workman, clerk, student, and so on—will receive the tools and instruments necessary for the occupation he is capable of exercising. These tools will be adapted to all the men's needs, notably the one-armed blind will be given the special knife of *M. Lotz*. The Conference resolves that the purchase of raw materials and the sale of manufactured products be facilitated to the blinded who have returned home, and in such a way as to avoid all stoppage of work: by the State in giving facilities of transport, in reserving orders for them; by private societies in assuring them in a permanent way the best conditions of purchase of raw material. It is desirable that local protection should be assured in each case by families living in the neighbourhood of the blinded man; such protectors will afford the blinded man moral aid and practical counsel, and will also on certain occasions serve as intermediaries between him and the administrations of the State or private societies.

The Deaf.

90. Lip-reading will be the only mode of re-education useful in deafness, organic, bilateral, and total. The instruction should be given by the teachers of institutions for deaf-mutes, and not by improvised teachers.

91. From the social point of view the auditory re-education with the object of allowing the deaf to utilise their remaining powers of hearing can be employed with this end concurrently with lip-reading.

92. It would be useful to create a "Fraternal Union of the Deaf by War," destined to group them, and to render easier the diverse conditions of their lives.

Sufferers from Lesions of the Nervous Centres.

93. The men gravely disabled owing to lesions of the nervous centres, still having need of attention and medical supervision, cannot be left to themselves or be returned to their families, who are unable to give the careful attention, prolonged and very costly, which is needed. The men should be re-united in special establishments, for their place is no longer either in the surgical wards or the institutions of neurological practice. It is of moment that installations reserved for these men answer not only to all the modern rules of hospital centres, but beyond this be organised with taste and even with daintiness, so that they may feel at ease. It is unnecessary that these men—to whom we owe more because they have suffered more, and are still destined to suffer morally and physically—should for a moment have the impression that they are grouped together in any kind of institution whatever on the ground of being incurable or because they are troublesome elsewhere. These men will be sent to their region of origin, and for this purpose a special service will be created in the chief town of each region or quite near this town, so as to permit frequent visits of their relatives and friends. When these establishments are founded in a town it will be well to find a place in the adjacent country to which the patients can be taken during a part of the fine season. This is what exists for those with lesions of the nervous system grouped at the Hôtel des Invalides at Paris. A single institution in the country in proximity to a great centre would obviously replace with economy the double installation. These men need special care, a particular medical supervision, a specialised medical personnel and nursing staff. The whole future of these patients depends on the attention they receive. In certain cases astonishing improvements can be hoped for with constant care and a functional re-education well conceived. Among these cases are many able to benefit by occupational re-education, either in town or rural pursuits.

94. That assistance be given to the invalided men of much diminished capacity (as those trephined), either in organising special workshops or in finding them employment, thus safeguarding their self-respect.

95. Basing itself on the experience acquired during nearly two years at the school of Ondes and on the results obtained there, the Conference wishes to see the official development of organisations analogous to those of Ondes.

Sufferers from Lesions of the Peripheral Nervous System.

96. In order to reduce the number of invalids owing to lesions of the peripheral nerves, it is desirable that the wounded be submitted, on their admission to a hospital at the front, to examination and treatment by a neurologist. The latter ought to be able to decide as to the opportunity of surgical intervention, to direct this, and all the subsequent treatment, physiotherapeutic, functional and occupational re-education. It is desirable, therefore, that neurologists be attached to the formations at the front. It is indispensable that forms of detailed observations be made out for all cases of wounds of the peripheral nerves.

Sufferers from Definite Mental Troubles.

97. War invalids presenting persistent mental defect should, more than all the other cases—on account, on the one hand, of the difficulty they have in acquiring new notions in regard to work and, on the other hand, owing to the force of the automatism and the experience acquired—be, when they are re-educable, maintained in their former work and replaced, if possible, in their previous surroundings. If this last condition cannot be fulfilled the re-education should be studied and tried in special institutions.

Documentation and Propaganda.

98. That since the question of the disabled by war, their pensions, as well as their occupational re-education, employment, and social protection, is common to all the countries of the Entente; and since it is to the interest of each of these countries to seek solutions which harmonise with the results of experience; and since these results can only be obtained by the organisation of an inter-Allied bureau of documentation on the matter, it is resolved: That in awaiting the creation of such a service by way of accord between the Governments interested, the Direction of the Statistique Générale of France be immediately charged with the collection of documents, with the object of publication, and be instructed to communicate to the Allied States such details on each question as may be asked.

99. That the Franco-Belgian Committee of the Inter-Allied Conference consider, with the least delay, the publication of an inter-Allied periodical review of prosthesis, orthopædy, and all the questions relating to functional and occupational re-education.

100. That an active and coördinated propaganda be organised in each Allied country by pamphlets, lectures, lantern demonstrations, meetings, &c., to make known in all parts of the country the resolutions adopted by the Inter-Allied Conference; to make the war invalids understand the reasons which have determined these resolutions, and the advantages which arise from them for the men and the country; to combat any contrary tendencies and propaganda, open or covert.

101. That, in order to facilitate occupational re-education: (1) The public authorities undertake to bear the cost of this re-education as well as the cost of maintaining the invalided man and his family during the course of re-education. (2) A special propaganda be carried out among the medical men and nurses of hospitals, as well as in the institutions carrying out re-education, with a view of defining the nature of their action in regard to occupational guidance, and of attaining coördination of the programmes in conformity with the resolutions of the Conference, and taking account of the usual openings in each region.

102. That a permanent inter-Allied committee be instituted to maintain the relations created by the Conference between the bodies and the persons who have taken part in its work and to prepare for the subsequent meetings of the Conference.

THE LANCET, VOL. I., 1917: THE INDEX.

OWING to the continued shortage in the paper-supply, the Index and Title-page to the volume of THE LANCET which was completed with the issue of June 30th, 1917, have been printed separately, and copies have been supplied gratis to those subscribers who have, up to July 18th, intimated to us their wish to receive them. Other subscribers will be similarly supplied, so long as the stock remains unexhausted, on application to the Manager, THE LANCET Office, 423, Strand, London, W.C. Such applications should be sent in at once.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Advanced Surgical Posts.

FROM the beginning of the war learned societies and Parliamentary Commissions have frequently discussed the best site to select for surgical stations, which should be equipped for urgent operations and as near as possible to the point at which the wounded men are picked up. The advanced aid-post, placed in the front trenches and continually exposed to heavy bombardment, can only be suitable for the first dressing, and wounded men must be evacuated from it as soon as possible to make room for newcomers. The morale of a wounded man cannot fail to suffer from the sense of being still in the midst of the battle although lying helpless on a stretcher. Grave operations, demanding an experienced surgeon, anæsthetist, assistants, and complete equipment, are only practicable in a quieter spot less crowded and less liable to sudden movement due to the fluctuations of the battle. Here are to be found the advanced surgical posts represented by mobile surgical ambulances and by immobile field hospitals set up in deep and spacious dugouts. Inasmuch as enemy bombardment is often carried out from very long distances, and as sanitary formations are always in danger from aeroplanes, it is the covered site which is generally to be preferred so long as the fighting line remains roughly stationary. Experience is now, however, beginning to show that even this solution of the problem is not completely satisfactory. Dr. Hardouin, who communicates his impressions to the Society of Surgery, cites the case of two well-managed surgical posts installed in deep dugouts 1500 metres from the front lines. At one 600 wounded men were received, of whom 23 were retained for treatment. Of the latter 7 succumbed rapidly before operation; 12 cases of hæmorrhage had ligatures applied, and were evacuated the same evening or the next day; 4 patients with abdominal wounds were retained for laparotomy. Of the last all four died, the first three at the post itself, the fourth—evacuated on the third day because bombardment rendered the air unfit to breathe—arrived at the neighbouring ambulance in a serious condition and died next day. The second post gave very similar results. The number of patients retained was greater, but on two occasions the wounded men had to be evacuated hurriedly by order of the military authority, and several died on the following day. Dr. Hardouin draws the conclusion that it is only possible to do really useful surgical work in grave cases in a field hospital situated not less than 5 kilometres from the front line, communicating with the advanced aid-posts by good roads and a well-managed service of transport. The rôle of the advanced aid-posts should be limited to collecting wounded men suffering from severe shock, particularly cases of hæmorrhage.

Prophylaxis against Measles and Scarlet Fever among the Troops.

The great frequency of measles and scarlet fever among the troops and the ease with which they develop into formidable epidemics in the conditions under which soldiers live have inclined several sanitary officers to adopt in the ambulances what is tantamount to Milne's method (painting the throat with 10 per cent. carbolised oil and rubbing the body with eucalyptus oil) in the prophylaxis of these conditions. In January, 1916, M. Lemoine (Médecin-Inspecteur) and M. Devlin (Aide-Major) employed it in certain large industrial districts which were much overcrowded with sick under conditions in which isolation of contagious cases was practically impossible. An ingenious contrivance was adopted. Each patient was enclosed in a muslin sheath hung from a wooden block fastened to the ceiling, the sheath around the head and chest being tucked under the bolster and mattress of the bed to form a kind of simple mosquito-net. The results were excellent and no epidemic occurred. Aide-Major Edgar Leroy adopted later another arrangement. Boxes made in the shape of huge coffins, the sides of which were of gauze stretched on wooden frames, were placed on the beds so as to cover the patient completely. A shutter at the level of the patient's head permitted of the two-hourly painting of the throat prescribed by Milne, and also for feeding. No case of measles or of scarlet fever was transmitted from bed to bed in the wards where these conditions were nursed side by side with the wounded. The only victim of infection was a nurse who dealt almost single-handed with a very large number of cases of scarlet fever. The patients made no complaint of the method and were sheltered from the draughts in the ambulances.

Determination by Staining of the Necrosed Parts of a Wound.

Professor Delbet recently described to the Society of Surgery a method by which the immediate closing of a wound may be safely effected after excision of the necrosed and infected parts. This method, which is now in frequent use by French surgeons, is only safe if all necrosed tissue has been entirely removed. To make this readily possible a colouring agent is employed which permeates the tissues and stains the necrosed parts. M. le Grand has worked out a dye consisting of 40 per cent. formalin to which 10 per cent. of methylene blue is added. By this solution healthy tissues are simply dyed blue, but necrosed parts become so dark as to be almost black, the parts to be excised being thus easily distinguished. The method is particularly valuable in ramified wounds, especially when complicated by fractures with splinters. Employing this method M. le Grand has only had four deaths in 109 cases of immediate suture of wounds thus treated. In 25 out of 26 cases of fracture treated in the same way the wound healed without suppuration.

July 14th.

URBAN VITAL STATISTICS.

(Week ended July 14th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was 11·7, against rates steadily declining from 12·8 to 11·2 per 1000 in the four preceding weeks. In London, with a population exceeding 4,000,000 persons, the death-rate was 12·1, or 1·7 per 1000 above that recorded in the previous week; among the remaining towns the death-rates ranged from 2·3 in Edmonton, 4·7 in Wimbledon, and 5·8 in Swansea, to 18·6 in St. Helens, 19·4 in Norwich, and 21·5 in Bury. The principal epidemic diseases caused 261 deaths, which corresponded to an annual rate of 0·8 per 1000, and included 116 from measles, 61 from infantile diarrhœa, 37 from diphtheria, 36 from whooping-cough, 6 from enteric fever, and 5 from scarlet fever. The deaths from measles were 2 in excess of the number registered in the previous week, and caused the highest annual death-rates of 2·0 in York, 2·3 in Walsall, and 5·5 in West Bromwich. The 634 cases of scarlet fever and 1067 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 8 below and 6 above the numbers remaining at the end of the previous week. Of the 3820 deaths from all causes in the 96 towns 161 resulted from violence. The causes of 34 deaths were uncertified, of which 6 were registered in Birmingham and 3 each in Liverpool and Rotherham.

Scotch Towns.—In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual death-rate was 13·7, against rates steadily declining from 17·0 to 15·0 per 1000 in the eight preceding weeks. The 257 deaths in Glasgow corresponded to an annual rate of 12·0 per 1000, and included 20 from whooping-cough, 19 from measles, 2 from infantile diarrhœa, and 1 from diphtheria. The 91 deaths in Edinburgh were equal to a rate of 14·3 per 1000, and included 5 from whooping-cough, 2 from measles, and 1 each from diphtheria and infantile diarrhœa.

Irish Towns.—The 115 deaths in Dublin corresponded to an annual rate of 15·0, or 0·2 per 1000 less than that recorded in the previous week, and included 4 each from whooping-cough and infantile diarrhœa. The 111 deaths in Belfast were equal to a rate of 14·7 per 1000, and included 2 from whooping-cough and 1 each from measles and infantile diarrhœa.

LITERARY INTELLIGENCE.—The "Dictionary of National Biography" has been presented to the University of Oxford by the family of the late Mr. George M. Smith, and will in future be published by the Oxford University Press. Mr. Smith undertook this great work at his sole risk and expense in 1882; during 15½ years, 1885–1900, under the editorship of Sir Leslie Stephen and Sir Sidney Lee, the original promise of quarterly publication was faithfully kept; the sixty-third volume which completed the Dictionary was published in 1900, and three volumes of supplement, bringing the record down to the death of Queen Victoria, were published in 1901. In 1908–9 these sixty-six volumes were re-issued in twenty-two volumes, now the current edition. Mr. Smith died in 1901, having brought to triumphant completion without State assistance or subsidy the largest of all national collections of biographies. In 1912 Mrs. George M. Smith, to whom the Dictionary had been bequeathed, published the second supplement of three volumes, containing the lives of all notable persons who died between Jan. 22nd, 1901, and Dec. 31st, 1911. It is intended to commemorate upon the title-pages of all new issues the name of Mr. George M. Smith, the initiator and first proprietor and publisher of the Dictionary.

"Audi alteram partem."

THE LUMLEIAN LECTURES AND MEDICAL RESEARCH:

THE ACTION OF DIGITALIS IN AURICULAR FIBRILLATION.

To the Editor of THE LANCET.

SIR,—When Sir John Broadbent takes umbrage at my carefully-guarded assumption that he doubts the existence of auricular fibrillation in man, he has but himself to thank. The statement in the last paragraph of his first letter is that he is "unable to accept in its entirety the doctrine of auricular fibrillation." Taken with its context, this statement could have been read in a less general sense, as I pointed out at the time. What Sir John Broadbent meant is not so important as what he conveyed to his readers, and a number of these, to my knowledge, interpreted his statement in the sense against which I directed my preliminary criticisms. I remain of opinion that they were justified in so interpreting it, and that my assumption was perfectly fair to Sir John Broadbent. My first point is gained when he dissociates himself from the wide interpretation; the issue is narrowed in that the existence of auricular fibrillation in man is not now to be questioned. It appears, also, that the conclusion that digitalis slows the ventricle in auricular fibrillation by the mere cutting off of a few impulses ("feeble," or "nervous," or otherwise, as the case may be) is not further to be questioned, and we are left with the third issue—namely, *is this action of digitalis more or less beneficial than a supposed action on the tone of the ventricular muscle?* But if it was his original desire that the discussion should be so limited, he was clearly unjustified in writing as he did. For this third issue is primarily concerned, not with the "doctrine of auricular fibrillation," but with the doctrine of *digitalis action*. Had Sir John Broadbent written "doctrine of digitalis action" he would not have been understood in a different sense, as he inevitably was in the circumstances.

I am quite prepared to accede to Sir John Broadbent's wishes and to neglect all but the third issue, for its discussion will equally well illustrate the divergence in the methods of thought of two schools. And, in parenthesis, I may remark that it is not my object in this correspondence to score a point off Sir John Broadbent, but to bring home to your readers generally the fundamental and important character of this divergence.

On the one hand, there is a body of workers who contend that in cases of auricular fibrillation digitalis exerts a remarkably beneficial action by producing heart-block, thereby showing the action of the ventricle. Upon what evidence does this contention rest? It has not been come to after a few moments of reflection, but by years of strenuous work. In published records *these workers* have shown, not only to their own satisfaction, but to that of other workers in the same field: (1) that the condition they deal with is in reality fibrillation of the auricles; (2) that an accelerated ventricular rate is reduced when digitalis is administered in cases of auricular fibrillation; (3) that any procedure which is known to induce heart-block will slow the ventricles if employed while the auricles are fibrillating; (4) that heart-block is induced by the administration of digitalis. They conclude that digitalis slows the action of the heart in auricular fibrillation by inducing heart-block, and their conclusion is arrived at by logical reasoning and is the inevitable conclusion from the facts. The same workers have shown (5) that hand in hand with the reduction of heart-rate there is a remarkable relief of symptoms. They are taught by physiology that when an accelerated heart-rate is reduced the work of the heart is greatly decreased. They further conclude, therefore, and are upon perfectly safe ground in concluding, that the symptoms are alleviated by the slowing of the ventricle which accompanies the digitalis action. On the other hand, it is held by Sir John Broadbent and those who think as he does that this explanation of the "beneficial action of digitalis in auricular fibrillation" is insufficient, and that "it is the action of digitalis in restoring the tone of the exhausted muscle so that it contracts more powerfully which plays a more important part."

It is necessary to my main object to point out that the new facts to which I have referred above have been elicited solely by members of the first school of thought; they are responsible for the observations which show that digitalis has beneficial effects in auricular fibrillation. It is not from these workers, but from a quarter from which no single new observation bearing upon this phenomenon has come, that a new and unacceptable explanation of it is offered. It is unacceptable because no argument has been put forward which has not already been considered fully by the responsible workers nor any new evidence which conflicts with their original conclusion. The attitude is, as I have said, philosophic, and it is precisely this attitude, and not Sir John Broadbent personally, that I am out to attack; and I attack it because it is sterile. What, then, are the arguments? According to Sir John Broadbent they are fully stated in his first letter. I find in his first letter these arguments:—

1. "Any clinician knows the extraordinarily satisfactory results obtained from the administration of digitalis in cases of heart failure and dropsy associated with mitral incompetence, even when the pulse is quite regular and there is no question of 'auricular fibrillation.'" To this I reply that no clinician, however much he may "know," has as yet shown this to be so. I challenge the production of the published records.

2. Professor Cushny has raised the question of a possible action of digitalis on the muscle of the ventricle. True; and he has dismissed it in the words: "This cannot be answered at present, as we have no means of measuring accurately the contraction of the human heart."

3. It is inferred that there is some mysterious and beneficial action in mitral stenosis *qua* mitral stenosis. This argument Sir John Broadbent accuses me of ignoring. I *have* ignored it; and because the idea, whatever it may be, is not so clearly expressed that I can comprehend it. The fact remains that no series of cases of mitral stenosis in which the rhythm is normal has been placed on record in which strikingly beneficial results have been demonstrated.[1]

And that ends the arguments. There is, first of all, no scientific evidence of a beneficial action in any way comparable to the strikingly beneficial action in fibrillation. There is not a shred of evidence that digitalis increases muscle *tone* in the accepted sense of that term; in fact, it is still questionable if tone, as a separate cardiac function, exists. There is, finally, no acceptable evidence that in man the force of contractions is increased by medicinal doses.

I point to the contrast, the solid and hard-earned substratum of recorded fact on the one hand, the appeal to authority (and often authority misinterpreted) and to questionable hypothesis on the other, and ask: Can I possibly consent to the view that this supposed and unproved action of digitalis upon muscle tone "plays a more important part" than does its proved action in slowing the ventricle? I answer that I prefer, as I believe your readers will prefer, a reasoned statement, each step of which is firmly cemented by original observation which has provided us with much fresh knowledge, to a hastily conceived idea, whose lead its authors have not the confidence or ambition to follow, thus to win for it, if it can be won, the support which alone can render it presentable or acceptable.

I am, Sir, yours faithfully,

Hampstead, July 7th, 1917. THOMAS LEWIS.

[1] I mean by strikingly beneficial results, such as are comparable to those obtained when the auricles are fibrillating.

THE EFFECTS OF SWALLOWING LIQUID CHLOROFORM.

To the Editor of THE LANCET.

SIR,—The inquest upon a soldier at Aldershot reported in this evening's papers (July 12th, 1917) reminds me that on March 14th, 1891, you published Practical Notes on the Administration of Ether and Chloroform, a paper read by me before the West London Medico-Chirurgical Society on Feb. 6th, 1891. In the course of it, referring to the administration of chloroform through a mouth-tube with Junker's inhaler, I said: "Take care that the bottle of the

Junker's apparatus is only one-third filled with chloroform, and that the indiarubber tubes are properly applied to the metal tubes (in the top of the bottle) each to each, or liquid chloroform instead of vapour will be administered. The danger of the accident (and its possible effect) does not require to be pointed out here by me." Care should also be taken to keep the bottle upright or similar effects will arise.

I once had an experience very similar to that recorded in the recent inquest at Aldershot. The Junker apparatus was handed to me by a theatre attendant with the tubes wrongly attached. It resulted in my driving the whole of the chloroform out of the bottle into the naso-pharynx—the tube was passed into the nostril, the operation being the removal of an epithelioma of the lower lip by the late Mr. Keetley. I had already anæsthetised the patient when I changed to the Junker apparatus and had compressed the air-ball two or three times when, the first incision of the V-shaped incision having been made, I noticed a drop of clear liquid fly out of the patient's mouth. I looked at the bottle, saw it was empty, and interrupted the operation to explain what had happened. The patient became cyanosed, the cyanosis rapidly increasing. The patient was laid on the floor and I began artificial respiration, asking for a stomach-pump and galvanic battery. Mr. Keetley at the same time proceeding to perform tracheotomy, and in doing so opened a good-sized thyroid vein from which very dark blood escaped freely. We allowed it to flow—the tracheotomy not being completed as the patient improved—and I believe that especially the bleeding and the use of the stomach-pump saved the man's life.

Altogether the time of the proceedings could not have been many seconds more than a minute. The operation was quickly completed and the patient was sent back to bed. Next morning I went to see how he was. I found him sitting upright in bed, looking happy. I said, "Have you any discomfort in your throat or pain?" and he answered, "None at all."

Now that latter fact was very interesting, in view of the well-known Bartlett case, in which it was argued that had chloroform been administered by the mouth it would have had more or less an escharotic effect. I do not intend to imply that I was a witness in that case. My impression is that it was my experience of the accident that led me to emphasise the necessity of assuring oneself that the tubes of the Junker were in order.—I am, Sir, yours faithfully,

Kensington, W., July 12th, 1917. RICKARD W. LLOYD.

THE TREATMENT OF WAR WOUNDS.

To the Editor of THE LANCET.

SIR,—In your issue of June 23rd Sir Almroth Wright again puts forward his views regarding the treatment of wounds, but does not refer to any criticisms of them. He has, however, given a few more experiments to support his ideas regarding hypertonic saline solutions; so I venture again to point out that he is really trying to demonstrate a thing which is contrary to the Newtonian law—action and reaction are equal and opposite. This being so, there must be explanations of these, as well as of his earlier experiments, which he has failed to see. Let us take, for example, the experiment with agar cylinders. In this, in view of my own experiments, it is difficult for me to believe that he made accurate quantitative estimations, and that his results were really as he assumed them to be, but granting that they were as he describes, would they not merely show that formalin rendered the agar impervious to salt while it remains pervious to water, and that osmosis therefore took place?

Then again, take the series of experiments with siphons. In these surely the true explanation is that because the salt diffused up into the siphon and made the fluid in the limb dipping into the salt heavier than that in the other, therefore a flow was established towards the salt.

Many other points call for comment and criticism, especially those relating to the antiseptic action of Dakin's solution and to "digestive cleansing," but it would hardly be worth while dealing with these so long as the criticisms regarding normal and hypertonic saline solutions remain unanswered.—I am, Sir, yours faithfully,

WM. PARRY MORGAN, M.D. Lond.,
Captain, R.A.M.C.

The Lord Derby War Hospital, Warrington, June 28th, 1917.

PURULENT BRONCHITIS.

To the Editor of THE LANCET.

SIR,—I shall be very grateful if you can spare a little of your valuable space to enable me to refer to the article "Purulent Bronchitis," by Lieutenant J. A. B. Hammond, Captain W. Rolland, and Lieutenant T. H. G. Shore in THE LANCET of July 14th.

During the past winter a large number of cases of bronchitis were admitted to the Connaught Hospital, Aldershot. Amongst such cases a very large proportion were of a distinctive type. It is unnecessary for me to dwell in detail upon the special features they presented; suffice it to mention that they were characterised by cyanosis of a particularly impressive appearance, by the expectoration of large quantities of thick purulent sputum, by increased frequency of pulse-rate and of respiration, and, most important of all, by an obstinate resistance to every form of treatment and an exceedingly high mortality. Although the majority of sufferers were among the younger men and those of comparatively poor physique, there was no definite age-incidence ascertainable, nor did it appear that this condition occurred only in those who had previously suffered from chest trouble and were presumably predisposed. Since a large majority of cases of pulmonary diseases encountered in this command run a notoriously anomalous course, we were at first inclined to believe that we were dealing with some local peculiarity, and it was only whilst special investigations were in course of procedure that we learnt that cases, apparently similar to our own, had been observed among troops both in other parts of the country and in France. Under the superintendence of Major Herbert French, consulting physician to the Aldershot Command, a paper embodying the clinical, bacteriological, and pathological results of our cases (which from the character of the expectoration we have also been accustomed to describe as "purulent bronchitis") has been in course of preparation for some months. In our investigations we have had the inestimable advantage of the services of Dr. Eyre, bacteriologist to Guy's Hospital, who has most generously afforded us all the assistance and resources of his great experience. I feel it only fair to my colleagues to state that our paper was begun long before the appearance of the article in the current issue of THE LANCET to which I allude, until the appearance of which we were not even aware that any special investigations were proceeding elsewhere. I have only to add, and it is a distinct pleasure to do so, that in every detail our results accord with those of your contributors and with every one of their six conclusions we agree without qualification. We have some additional features of interest to add chiefly on the clinical side, but these do not in any way affect the main conclusions. In fact, I hope I may be permitted to express the opinion that this admirable paper by Lieutenant Hammond, Captain Rolland, and Lieutenant Shore is a remarkably complete account of the disease and may fairly be regarded as a standard description of "a symptom-complex constituting a definite clinical entity."

I should like also to venture the hope that the publication of this paper and my own small reference to it may have the effect of focussing attention upon this special type of bronchitis which it is reasonable to anticipate will reappear during the winter months, and to stimulate the production of some form of treatment (or possibly even prophylaxis) of one of the most lamentably fatal diseases it appears possible to encounter.—I am, Sir, yours faithfully,

ADOLPHE ABRAHAMS,
Temporary Captain, R.A.M.C., Officer in Charge of Medical Division, The Connaught Hospital, Aldershot.

July 16th, 1917.

ROYAL COLLEGE FOR THE BLIND, UPPER NORWOOD.—An anonymous donation of £1000 has been sent to the Public Trustee towards the amount which is required to secure the grant of £12,500 promised by the Carnegie Trustees to the Royal College for the Blind.

TRELOAR CRIPPLES' HOSPITAL, ALTON.—At a garden fête opened at Southwood Hall, Highgate, on July 14th, Sir William Treloar said that Lady Irene Curzon had collected the greatest individual amount, £500, of any member of the Queen Alexandra League, which worked for the institution. Since the opening of the hospital 1450 children had been cured

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue :—

Killed by an Explosion in H.M.S. Vanguard.

Surgeon E. Rayner, R.N., qualified M.B., B.C. Camb. in 1912.

Fleet-Surgeon E. Cox, R.N., was educated at Cambridge University and at the London Hospital, and qualified in 1899. After holding an appointment in the out-patient department at the London Hospital, he joined the Royal Navy.

Staff-Surgeon W. G. Barras, R.N.V.R., was educated at Glasgow and at Durham Universities, and qualified in 1889. Prior to going on active service he was in practice at Govan, Glasgow, where he held several appointments, and was for some time assistant medical officer of health and bacteriologist to the burgh of Govan.

Died of Wounds.

Lieut. B. Cohen, R.A.M.C., qualified at Glasgow in 1913, and was in practice at Cape Town, South Africa, prior to joining the R.A.M.C.

Capt. W. A. Sneath, M.C., R.A.M.C., was educated at Manchester University and graduated as M.B., Ch.B. in 1910. In 1912 he took the English double qualification, and proceeded to the F.R.C.S. Eng. in the following year. After holding appointments at the Seamen's Hospital, Greenwich, at the Manchester Royal Infirmary, and in the Anatomy Department of the Victoria University, he practised at Ashton-under-Lyne. The award of the Military Cross was recorded in THE LANCET of Sept. 30th, 1916, p. 621.

Capt. H. E. Rose, R.A.M.C., attached Coldstream Guards, qualified at Glasgow in 1913, and was in practice at Acton, London, before joining the R.A.M.C.

Capt. A. G. Peter, M.C., R.A.M.C., attached Seaforth Highlanders, was educated at Aberdeen University and at King's College, London, and qualified in 1903. He had held appointments in the borough of Croydon, at the Brook and Grove Hospitals of the Metropolitan Asylums Board, and at the St. Pancras Infirmary, Highgate, and was medical officer of the Prestea Gold Mines and of the Prestea district. The award of the Military Cross was recorded in THE LANCET of Jan. 20th, 1917, p. 125.

Died.

Temp. Lieut. J. E. Foreman, R.A.M.C., was a student at the London Hospital, and qualified in 1906. He was in practice at Bournemouth before joining the R.A.M.C., and was senior resident medical officer at the Boscombe Military Hospital. He died at Alexandria, Egypt, from enteric fever, on July 9th.

Previously reported Missing, believed Drowned, now reported Drowned.

Lieut. J. G. Bradley-Smith, R.A.M.C. (see THE LANCET, June 2nd, 1917, p. 856).

Wounded.

Lieut.-Col. W. H. L. McCarthy, M.C., R.A.M.C.
Lieut. H. R. Grellet, R.A.M.C., attached Yorks and Lancs Regiment.
Lieut. J. A. McIlroy, R.A.M.C.

Wounded and Prisoner in German Hands.

Capt. H. Stokes, R.A.M.C.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of medical men are reported :—

Capt. B. N. Rice, East Yorkshire Regt., died of wounds, son of Dr. B. Rice, of Warneford Hospital, Leamington.

Second Lieut. G. L. Stokes, Royal Field Artillery, killed in action, son of Dr. L. Stokes, of Blackheath, Kent.

Second Lieut. L. N. Cook, M.C., Royal Lancaster Regt., killed in action, youngest son of the late Dr. J. N. Cook, at one time medical officer of health at Calcutta.

Fleet-Surgeon E. Cox, R.N., killed by an explosion in H.M.S. *Vanguard*, youngest son of the late Surgeon-General C. L. Cox, I.M.S.

Midshipman A. W. de Segundo, R.N., killed by an explosion in H.M.S. *Vanguard*, second son of Major C. S. de Segundo, R.A.M.C. (T.).

Lieut.-Commander A. C. H. Duke, R.N., killed by an explosion in H.M.S. *Vanguard*, eldest son of the late Colonel A. W. Duke, R.A.M.C., of Tunbridge Wells.

FOREIGN DECORATIONS.

French.

Légion d'Honneur : Croix d'Officier.—Lt.-Col. W. R. Blackwell, R.A.M.C.

Légion d'Honneur : Croix de Chevalier.—Capt. (acting Lt.-Col.) R. Magill, R.A.M.C., Spec. Res.; Maj. E. T. Potts, D.S.O., R.A.M.C.; Temp. Capt. G. Rankine, M.C., R.A.M.C.; Capt. W. H. P. Hey, R.A.M.C.; Capt. F. M. Hughes, R.A.M.C.

Légion d'Honneur : Croix de Guerre.—Temp. Capt. T. Meagher, M.C., R.A.M.C.; Capt. J. A. C. Scott, M.C., R.A.M.C.; Temp. Capt. C. E. S. Wright, R.A.M.C.: Maj. W. H. K. Anderson, Canadian A.M.C.

THE TRAINING OF THE DISABLED SAILOR AND SOLDIER: A COUNTY SCHEME FOR LANCASHIRE.

We were able to state in THE LANCET of April 28th that in Lancashire the county authority was collecting information from all the education authorities with regard to the facilities they would be able to offer for training disabled men in various industries. A conference of representatives of local committees under the Naval and Military War Pensions Act, 1915, with the education authorities and other bodies in Lancashire had been convened by the lord lieutenant of the county, and held in Preston on Feb. 16th, when Mr. G. M. Barnes, M.P., the Minister of Pensions, and Sir Arthur Griffith-Boscawen, M.P., the Parliamentary Secretary to the Ministry, strongly supported the idea of coöperative action among the various interested bodies. At this conference it was resolved that it was the duty of the Government to provide the necessary cost of dealing with disabled sailors and soldiers and to repay any expenditure thrown upon local education authorities and other bodies in making provision for them. A committee appointed at this conference to go into the question has presented a report, which has reached us through Professor H. Lloyd Snape, director of education for Lancashire County Council.

The report states the unanimous conviction of the committee that a scheme for coöperative action among the local statutory committees is the only method by which each committee will be able to carry out its duties with efficiency and economy. It recommends the appointment of an advisory committee with a central bureau for the collection and distribution of information, able to focus the requirements of all the local committees, and to suggest schemes which can be carried out to meet the combined demand with a reasonable expenditure. Where such scheme related to training in technical or other educational institutions it would be sent to the education or other appropriate authority. If the scheme had reference to the extension of hospital or hostel accommodation and treatment, the advisory committee would be a useful medium for pressing the subject forward on behalf of all the local committees. The central bureau would, further, be the medium for bringing the local committee requiring any treatment or training for a man into direct communication with the institution capable at the moment of supplying it, and would keep a register of hostels and lodging-houses suitable for men who might require accommodation in any district, while receiving outdoor treatment at a hospital, or training.

An Appendix contains the report of a committee instructed to collect information on the available sources of supply for training disabled men in the county. Education committees were circularised in whose areas it seemed likely that facilities for training disabled men could be provided during the daytime, and replies to the circular were received from 56 authorities, all of whom were willing to make their resources available for training men. A detailed list has been compiled from these returns, the committee seeking to select from the information before them those areas where training for particular trades could be carried out under the best conditions. They believe that it would be preferable to provide thoroughly good opportunities of training at a limited number of centres, rather than a much larger number, in some of which, at least, training could only be of a partial character. By following such a policy, not only would training be more efficient, but expenses materially reduced. A number of education authorities were relying on the coöperation of private as well as public employers in training men. Such assistance had actually been offered in some areas, pointing to a means whereby the facilities for training could be almost indefinitely extended.

The list of facilities available includes large groups, such as (*a*) agriculture and horticulture, (*b*) engineering trades,

(*c*) building and allied trades, (*d*) coal mining, (*e*) textile occupations, (*f*) boot and shoe manufacture, (*g*) nautical occupations, (*h*) printing and allied trades, (*j*) commercial and clerical occupations, (*k*) art and art industries, and a miscellaneous group including gas-fitting, instrument-making, basket-making, boot repairing, tailoring, hair-dressing, and various other minor occupations.

A further Appendix to the Report gives detailed information with regard to the hospitals and kindred institutions and their ability to deal with disabled sailors and soldiers. The table is an extensive one, giving under the several headings: (1) name and address of institution; (2) particulars of treatment given; (3) the use of electrical and mechanical apparatus, with the qualifications of the operator; (4) availability for men resident outside the district; and (5) and (6) the number of in- and out-patients respectively who could be treated. A single example of the information offered may be given: Ashton-under-Lyne—(1) the District Infirmary, Ashton-under-Lyne; (2) all treatment usually given in a properly equipped general hospital—the hospital contains 140 beds, 22 of which are devoted to wounded soldiers, and is extending its accommodation by 28 beds, so as to take in more soldiers; (3) there is a fully equipped X ray and electrical department, under the control of a skilled medical officer, and also a department for massage, controlled by a fully qualified masseuse; (4) not at the present time, as the demands of the district (the infirmary serving Stalybridge, Hyde, Mossley, and Dunkinfield, as well as the Ashton-under-Lyne area) are more than the infirmary can fully cope with.

HOSPITALS IN INDIA.

In the House of Commons Lord H. Cavendish-Bentinck recently asked Mr. Austen Chamberlain, as Secretary for India, whether his attention had been called to the fact that there were over 140 British officers now stationed at Abbottabad, North-West Frontier Province, and that there were from 60 to 70 British officers there in peace time; whether he was aware that there was no hospital within 85 miles, and that the only hospital accommodation locally available was one room taken from the native troops' hospital. The question was a prelude to the request for an inquiry to be made into the efficiency of the Indian military medical service, and gave Mr. Chamberlain an opportunity of showing to the House that medical matters in India had been anxiously present to his mind for some time previous to the publication of the Mesopotamia Report. He said that some time ago he had formed the opinion that the standard of comfort and accommodation in the hospitals for British and Indian troops must be improved, and that progress had already been made in this respect before the Mesopotamia Report was received. Mr. Chamberlain has resigned office, and was undoubtedly placed in a position by the Report which made his action a logical one, but those who know his work during his term of authority can all testify to his anxious consideration of medical questions, if and when their *pros* and *cons* came before him. Mr. Chamberlain's description of his own position in respect of the medical breakdown in Mesopotamia was not only dignified but transparently truthful. He said:—

> I cannot say one word of excuse to palliate the horrible breakdown which occurred. I think nearly 18 months ago, 15 or 16 months at least, before I was in possession of a tithe of the information which is now available to the House and the whole country, I said that in my opinion a lamentable and, I think, inexcusable breakdown had occurred. From first to last there was no attempt made by me or by any member of the Government to pretend that things were going well when we knew they were going ill, or to hush up any maladministration which had taken place. The Commission spoke in generous terms of the letters and telegrams which I addressed to the Viceroy on this subject, but they want to know why I did not send a public despatch at the same time in the year 1915. I will tell the House what information I had in 1915. Ctesiphon was fought at the end of November and Sheikh Saad was fought on Jan. 6th. It was after these two actions that the suffering was greatest, and that great calamities and horrible miscarriages took place. I searched my papers before going to the Commission, and I cannot find that I had any information except three extracts from a letter written by Second-Lieutenant Palmer, Lord Selborne's son, which was sent to me by Lord Selborne. It was a single letter written by an officer who was killed at Ctesiphon, which reached his family after his death. How could I have founded a despatch on material such as that? What put me first on the alert was the statement by Lieutenant Palmer that he thought the sanitary arrangements were bad compared with what he had seen in South Africa, and he subsequently wrote a letter in which he described a statement I had made in this House on the authority of information received from Mesopotamia, as to the condition of the supply of comforts for the hospitals at the base as "eye-wash." That is all the information I had, and I had no conception of a breakdown such as we now know had taken place. What I was anxious for was to see that all the ordinary precautions had been taken to guard against the special dangers of a tropical climate. I did not know of any shortage of equipment and of personnel, and I was anxious to take these special precautions which tropical climates might require. It was not until the middle and close of February that the information began to reach this country in streams in letters from Mesopotamia showing what awful conditions had prevailed. I do not think there was material there for a despatch. I regret that the warnings which at my instance Lord Hardinge conveyed to the Commander-in-Chief were not sooner acted upon and were not more seriously received. I wrote direct and telegraphed direct to the Viceroy because, in the first place, I wanted to go direct to the highest authority in India and not have my message intercepted in the bureaux and the reply sent by I knew not whom, without the Viceroy or the Commander-in-Chief knowing anything about it. I telegraphed directly a private telegram because I wanted both these officers to know that the Secretary for State was personally concerned. I telegraphed to Lord Hardinge because I thought that in matters of this kind the heart of the civilian is more tender than the heart of a soldier, and that he is less ready to accept those hardships as the necessary incidents of a campaign. I was right, and if action had followed Lord Hardinge's representations at any rate the evils would have been redressed much earlier than they were.

THE SERVICES.

ROYAL NAVAL MEDICAL SERVICE.

Staff-Surgeon N. B. U. Jacob and Surgeon W. E. Lloyd have been placed on the retired list.

To be temporary Surgeons: E. A. Crook, H. Banks, E. C. Dunlop, W. Duncan, A. G. Brett, J. L. Lamont, A. O. Ross, J. Aydon, W. F. Harvey, H. J. R. Surrage, W. Meade.

ARMY MEDICAL SERVICE.

TERRITORIAL FORCE.

Lieut.-Col. H. W. Thomson to be Assistant Director of Medical Services.

Lieut.-Col. H. W. Thomson vacates the appointment of Assistant Director of Medical Services.

Major (acting Lieut.-Col.) H. Richardson to be Assistant Director of Medical Services, and to retain the acting rank of Lieutenant-Colonel whilst so employed.

ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonels to be temporary Colonels whilst employed as Assistant Directors of Medical Services of a Division: H. B. Fawcus, E. P. Sewell.

Lieut.-Col. J. C. B. Statham to be temporary Colonel whilst employed as Assistant Director of Medical Services, Lines of Communication.

F. C. Dwyer to be temporary Lieutenant-Colonel.

Majors retaining the acting rank of Lieutenant-Colonel whilst in command of Casualty Clearing Stations: C. H. Turner, J. Powell, B. F. Wingate.

Temp. Major E. L. Stone, Canadian A.M.C., to command a Canadian Field Ambulance, and to be temporary Lieutenant-Colonel while so employed.

Major S. A. Smith, Canadian A.M.C., to be temporary Major.

The undermentioned are granted temporary rank whilst employed at the Whipps Cross War Hospital:—As Major: Andrew Stewart. As Captain: Daniel Broderick.

J. Patterson, Canadian A.M.C., to be temporary Captain.

Temp. Major J. G. Hunt, Canadian A.M.C., is seconded for service with Anglo-Russian Red Cross Hospital, without pay and allowances.

Temporary Lieutenants to be temporary Captains: J. Goss, A. C. Lambert, W. A. Shafto, H. L. Morrow, J. J. Walshe, K. Black, B. E. Hughes, W. Reynolds, R. L. M. Wallis, E. G. Stanley, P. R. O'R. Phillips, M. A. MacKinnon, R. Stipe, J. G. Jones, P. S. Marshall, W. J. Moir, W. H. T. Jones, V. R. Hirsch, J. N. Lyons.

J. B. Barry, late temporary Captain, is granted the honorary rank of Captain.

Officers relinquishing their commissions: Temp. Major R. G. Riches. Temp. Capts. R. T. Cooke, M. J. Gallagher, F. H. Looney, H. T. Wilkins, R. D. Brunton, J. H. Hart, H. P. D'A. Benson, W. M. S. Robinson, W. Tregenza, E. C. Pratt, A. H. Tovey, A. Adams, J. W. McCagie, J. Muirhead, P. J. Murphy, G. N. Urie, J. H. White, L. E. V. E. Clayton, C. Reidy, M. H. Paterson, G. R. C. Wilson, N. G. Meade, A. D. Clanchy, W. F. Blewitt, A. Whitby, S. H. Booth, A. E. Henton, F. J. Wheeler, H. W. Binks, M. Macnicol, A. F. Menzies, W. A. L. H. Henderson, J. Clark, A. B. Northcote, W. S. Lazarus-Barlow, I. Alluan, A. Rennie, S. Y. Walsh, L. E. Ashley-Emile, W. Bannerman, A. A. Moon. Temp. Lieuts. G. Stivala-Aspinall, J. M. W. Morison, H. H. Lawrence, H. R. Helsby, A. F. W. Millar (on account of ill-health), J. Duredon.

SPECIAL RESERVE OF OFFICERS.

To be acting Lieutenant-Colonels whilst in command of a Field Ambulance: Major Rowland P. Lewis, Capt. Cyril Helm.

H. Robinson to be temporary Major whilst employed at the Horton (County of London) War Hospital.

Capt. M. J. Graham to be acting Lieutenant-Colonel whilst in command of a Field Ambulance.

To be Lieutenants: J. C. C. Howe (from University of London Contingent, O.T.C.), A. B. MacDougall, J. Scott, J. Adams.

Lieut. (on probation) Albert E. W. Sandelson relinquishes his commission.

TERRITORIAL FORCE.

Lieut.-Col. H. W. Thomson is restored to the establishment on vacating the appointment of Assistant Director of Medical Services.

Major (acting Lieut.-Col.) H. Richardson is seconded whilst holding an appointment as Assistant Director of Medical Services.

Capt. C. A. Spooner to be Major and to remain seconded.

Capt. (temp. Lieut.-Col.) D. E. Evans reverts to the temporary rank of Major on alteration in posting.

Capt. E. H. E Stack is seconded for duty with General Hospital.

Capt. (acting Lieut.-Col.) J. Blackwood relinquishes the acting rank on ceasing to command a Field Ambulance.

Medical News.

UNIVERSITY OF OXFORD.—At examinations held recently the following candidates were successful:—

FIRST B.M. EXAMINATION.

Organic Chemistry.—R. S. Creed, Trinity; J. Harris, Jesus; H. L. Rayner, Balliol.

Human Anatomy and Physiology.—C. C. Chavasse, Hertford; H. P. Hodge, non-collegiate; and D. B. Pauws, Trinity.

SECOND B.M. EXAMINATION.

Materia Medica and Pharmacology.—T. A. Brown, B.A., Exeter; E. H. Cluver, B.A., Hertford; D. C. Dixey, B.A., Brasenose; R. Gainsborough, Magdalen; C. F. Krige, B.A., Hertford; J. E. B. Morton, B.A., Queen's; and A. E. Thomas, B.A., University.

Pathology.—H. G. Burford, B.A., Christ Church; J. C. Dixey, B.A., Brasenose; T. B. Dutton, M.A., Magdalen; J. E. B. Morton, B.A., Queen's; H. W. Toms, B.A., Jesus; B. Tordoff, B.A., St. John's; and K. F. D. Waters, B.A., Keble.

Forensic Medicine and Public Health.—J. J. Conybeare, B.A., New; G. R. Cowie, B.A., University; E. A. Crook, New; T. B. Dutton, M.A., Magdalen; W. F. Harvey, M.A., Balliol; R. M. Humphreys, St. John's; R. W. Lush, B.A., Christ Church; J. J. Savage, B.A., Brasenose; and J. P. S. Walker, B.A., Oriel.

Medicine, Surgery, and Midwifery.—J. J. Conybeare, B.A., New; G. R. Cowie, B.A., University; E. A. Crook, New; W. F. Harvey, M.A., Balliol; R. W. Lush, B.A., Christ Church; and J. P. S. Walker, B.A., Oriel.

UNIVERSITY OF CAMBRIDGE.—At examinations for medical and surgical degrees held in Lent and Easter terms the following candidates were successful:—

SECOND EXAMINATION.

Part I., Human Anatomy and Physiology (March).—N. D. Dunscombe, Downing; H. A. A. Pargeter, Sidney Sussex; R. Y. Paton, Trinity; R. R. Sarra, B.A., Sidney Sussex; W. S. R. Thomas, Queens'; W. G. Tilleke, non-collegiate; and V. A. van Geyzel, St. John's.

Part II., Pharmacology and General Pathology (April).—G. F. Abercrombie, Caius; L. H. Bartram, B.A., Trinity; H. B. Bullen, B.A., Clare; F. T. Burkitt, B.A., Christ's; W. R. Carling, Emmanuel; A. E. Clark-Kennedy, B.A., Corpus Christi; C. H. Gunasekara, B.A., Clare; S. L. Higgs, B.A., St. John's; C. McC. Jones, B.A., Downing; G. W. Karunaratna and J. R. Mitchell, B.A., Clare; E. N. Showell-Rogers, B.A., Caius; A. G. Shurlock, B.A., Jesus; S. D. Sturton, Emmanuel; C. E. Taylor, B.A., Trinity Hall; G. W. Theobald, Emmanuel; D. Wallice, B.A., Clare; and D. E. Wijewardene, B.A., Peterhouse.

Part I., Human Anatomy and Physiology (June).—B. H. Cole, B.A., H. Selwyn; H. A. Crowther, St. John's; R. H. Emmett, Trinity; D. G. Garnett, Pembroke; F. R. Oliver and C. L. Pasricha, Caius; A. D. Porter, Pembroke; A. E. Roche, Magdalen; W. Shaw, St. John's; N. G. Thomson, Emmanuel; and A. D. Whitelaw, St. John's.

THIRD EXAMINATION.

Part I., Surgery and Midwifery (June).—H. R. Bickerton, B.A., Trinity Hall; A. J. Copeland, B.A., Pembroke; E. T. D. Fletcher, B.A., Magdalen; H. Gainsborough, B.A., Downing; A. R. Jennings, M.A., Jesus; J. B. S. Lewis, B.A., Downing; A. H. Pearce, B.A., Clare; and S. Riddiough, M.A., King's.

Part II., Medicine, Pathology, and Pharmacology (June).—K. B. Dickson, B.A., Trinity; H. Gainsborough, B.A., Downing; D. W. R. Richardson, B.A., Caius; and F. A. Williamson, B.A., Queens'.

UNIVERSITY OF BRISTOL.—At examinations held recently the following candidates were successful:—

M.B., Ch.B., Final Examination.—Part I. only: Evelyn Bessie Salter.

Diploma in Public Health.—Part II., completing examination: Isaac Bernard Barclay. Part II. only: Henry James Drew Smythe.

Diploma in Dental Surgery, Final Examination.—William Holder Shipway.

B.D.S., Second Examination.—Doris Breta Milton.

Diploma in Dental Surgery, Second Examination.—Violette Bourgeois.

ROYAL COLLEGES OF PHYSICIANS OF LONDON AND SURGEONS OF ENGLAND.—At the Second Professional Examination in Anatomy and Physiology, held on June 28th and 29th and July 2nd and 3rd, 91 candidates presented themselves of whom 60 were approved and 31 were rejected. The following are the names of the successful candidates:—

Fazal Farid Abdullah, St. Mary's; Robert Geoffrey Addenbrooke, Birmingham University; John Griffith Barrie, Guy's; George Frederick Baxter, Westminster and King's College; Alexander Herbert Bean, University College; Solomon Blackman, London Hospital; Hugo Boger, University College; Hubert Brookman, Middlesex; George Frederic Burnell, King's College; Frederick Cecil Wray Capps, Cambridge University and St. Bartholomew's; Louis Ely Reginald Carroll, St. Bartholomew's; Leslie Charles Frederick Chevens, St. Thomas's; Francis Christian, Calcutta and Middlesex; Gilbert Leedham Clements, Birmingham University; Henry Nathan Warner Collins, King's College; Percival Charles Collyns and Jose Joaquim da Gama Machado, St. Bartholomew's; Kenneth Vincent Deakin, Manchester University; Francis Percival de Caux, St. Bartholomew's; Archibald Glen Duncan, London Hospital; Dwijendra Nath Dutt, Edinburgh University and Middlesex; Arthur James Fenn and James Hassall France, King's College; Werner Göthe, Middlesex; Martin Curgenven Hartley, London Hospital; Henry Hirst, Manchester University; Thomas Barnard Hodgson, Oxford University and St. Bartholomew's; Donald Hunter, London Hospital; Frederick James, King's College; Madari Andia Keshvalu, Madras and University College; Joseph Victor Landau, St. Bartholomew's; Henri Toussaint Le Vieux, Guy's; John Andrew Mackay Ross, St. Bartholomew's; Tadros Ibrahim Makar, King's College; Prosper Henry Marsden, Liverpool University; Christopher Wesley Narbeth, St. Bartholomew's; Charles Frederick Newman and Vernon Arthur Newton, Birmingham University; Daniel Joseph O'Meara, Guy's; Frederick Ferdinand Petersen and Norman August Marais Petersen, London Hospital; Herbert Alfred Potter, Middlesex; Shaikh Abdul Hakeem Qureshi, Bombay and University College; Edgar Lewis Jones Reason, St. Mary's; John Groscort Reed, St. Thomas's; Ronald Cunliffe Shaw, Manchester University; James Victor Alexander Simpson, Middlesex; William Arthur Merrett Smart, London Hospital; Frederic Downing Spencer, Birmingham University; Philip Steinberg, London Hospital; Edward Howard Strange, University College, Cardiff; Aubrey Clifford Teuten, St. Mary's; Mark Tree, London Hospital; Terence Watson Turner, Aberdeen; Germain Victor Leon van Acker, Oxford University; Norman Victor Wadsworth, Guy's; William Walsham, St. Mary's; Tudor Williams, University College, Cardiff; Henry Norman Witham, St. Thomas's; and Jacob Elias Zeitlin, London Hospital.

At the quarterly examination in Practical Pharmacy, held on July 5th and 6th, the following candidates were approved:—

Alexis Oswald Bekenn, Birmingham University; Charles Clement Beney, Cambridge University and London Hospital; Henry Walter Breese, Middlesex; Mary Burfield, Marion Constance Vera Clarke, and Beatrice Lakeman Collins, Royal Free; Olive Francis Conoley, London Hospital; Cyril George Coombs, Guy's; Nancy Barbara Daniell, University College Hospital; James Douglas Dimock, Sheffield University and Middlesex; Clarence Franklin Eminson, Charing Cross; Nancy Kathleen Gibbs, Cardiff; Thomas John Ernest Gittins, Birmingham University; Samuel Gordon, Cardiff; Cyril Bowdler Henry, Sheffield University and Westminster; Arthur Robert Hill, Middlesex; Cyril Patrick Hines, Charing Cross; Harry Cunliffe Hopkinson, Cambridge and Manchester Universities; Mohammed Ibrahim, Middlesex; Violet Ruth Jeffery, Royal Free; Evelyn Hope Johnson, Manchester University; George Henry Johnson, Middlesex; David Ellis Jones and Wyndham Moody Jones, Cardiff; Eric John Llewellyn Jones-Evans, St. Thomas's; Francis William Kemp, Charing Cross; George Spencer Lajus Kemp, Sheffield University; Wright Lambert, Middlesex; Kenneth Wilfred Leon, St. Bartholomew's; Elizabeth Kathleen Mackay, Charing Cross and King's College; Edgar Duncan Macmillan, St. Bartholomew's; Donald Gregory Macpherson, New Zealand University and University College Hospital; Gordon Manet-Wallett, St. Bartholomew's; David Chaim Mintzman, Marseilles, Paris, and King's College; Ivor Noble Orpwood Price, Cardiff; Mohammed Abbas Ragy, King's College; Mary Jane Ripley, University College Hospital; Walter Manley Savory, Middlesex; Harry Norman Schapiro, Guy's; James Mortimer Schofield, St. Mary's; John Share-Jones, Liverpool University; Mohamed Sidky, Cairo and Guy's; Norman Leigh Simpson, Cardiff; Margaret Charlotte Sorace, Royal Free; Sobhi Rizkallah Simaika, St. Bartholomew's; George Foster Smith, Manchester University; William Henry Barton Stride, private study; Annie Dorothea Symons, Royal Free; Leslie James Timings, Birmingham University; Edward Sherman Toogood, Oxford University and University College Hospital; Jacob Eliza de Villiers van der Merwe, Guy's; William John Vickers, Birmingham University; and Fuad Wanis Zaglama, Manchester University.

THE NATIONAL MEDICAL UNION.—The annual general meeting of the National Medical Union was held on June 30th at 346, Strand, London, W.C., under the presidency of Mr. V. T. Greenyer. The report of the Council having been received and adopted and the balance-sheet approved, the following, among other resolutions, were passed:—

1. That the question of establishing a Ministry of Health should be postponed till after the war, in view of the importance of the question to the profession and the number of its members abroad on military service.

2. That any provision made for medical attendance on discharged disabled soldiers and sailors ought to be outside the National Insurance Acts, and that such provision ought to be made under conditions which will allow of these persons being attended by any registered practitioner they may respectively choose.

3. That the National Medical Union protests against the State employment for wages or reward of conscientious objectors by the National Health Insurance Commission or by any other Government department.

4. That the National Medical Union, while upholding the principle of saving infant lives, strongly disapproves of the methods of the Local Government Board. The propaganda involved in the National Baby Week cannot but tend to demoralisation.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH.—At a meeting of the College held on July 17th, the following gentlemen, having passed the requisite examinations, were admitted Fellows:—

Thomas Ewing, M.B., Ch.M. Sydney; William Lang Hodge, L.R.C.S. Edin.; John MacLean, M.B. Tor., M.C.P. & S. Sask.; William Wood Shorten, L.R.C.S. Edin.; Horace Powell Winsbury White, M.B., Ch.B. Edin.; and Frederick Joseph Woo, M.B., Ch.B. Edin.

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL (UNIVERSITY OF LONDON).—The following awards have been made:—Burney Yeo Scholarships: E. H. Cluver, Hertford College, Oxford; M. S. Thomson, Downing College, Cambridge. Senior Scholarship: L. B. Goldschmidt. Tanner Prize: D. C. Clark and C. K. Scales (equal). Todd Prize and Medal: A. Blackstock. Class Prizes: Medicine—L. M. Moody; Obstetric Medicine—A. Blackstock; Pathology—D. C. Clark and L. M. Moody; Hygiene—L. M. Moody Psychological Medicine—A. N. M. Davidson.

METROPOLITAN HOSPITAL SUNDAY FUND.—The following are among the amounts received at the Mansion House to date:—

	£
St. Mark's, North Audley-street	1440
St. Columba's, Pont-street	436
Holy Trinity, Sloane-street	271
Essex Church, Kensington	256
St. Paul's, Knightsbridge	222
St. James's, Paddington	217
Greek Church, Bayswater	167
St. Peter's, Cranley-gardens	146
St. Paul's, Onslow square	133
Holy Trinity, Tulse Hill	127
St. Margaret, Halstead	118
St. Barnabas, Kensington	94
Christ Church, Chislehurst	91
Holy Trinity, St. Marylebone	85
All Souls', Hampstead	82
All Saints', Highgate	80
Annunciation, St. Marylebone	76
St. Peter's, Bayswater	69
Holy Trinity, Sydenham	66
Fulham Parish Church	65
Barnet Parish Church	62
St. Paul's, Wimbledon Park	56
St. Peter's, Belsize Park	51
St. Mary and St. Mary-le-Park, Battersea	51
Regent-square Presbyterian Church	51
St. Peter's, Dulwich Common	51
St. James's, West Hampstead	51
St. Luke's, Kilburn	50
St. James's, Hatcham	48
St. Giles-in-the-Fields	45
St. Luke's, Battersea	45
St. Cuthbert's, West Hampstead	45
St. German's, Blackheath	43
All Saint's, Notting-hill	41
St. Margaret, Lee	41
Bromley Cong. Church	40
St. Mary Magdalene, Munster-square	40
St. Dunstan's-in-the-West	38
Streatham Wesleyan Church	38
Union Chapel, Islington	38
St. James's, Holloway	34
Islington Parish Church	33
Christ Church, Chelsea	32
Holy Trinity, Haverstock-hill	31
St. Michael's, Abbey Wood	30
Merton Parish Church	28
St. Mary's, Finch.ey	27
Streatham Hill Cong. Church	27
St. John's, Hoxton	27
Clapham Parish Church	26
St. Margaret, Streatham	26
St. John's, Southall	26
St. Gregory, Earlsfield	26
St. Augustine's, Grove Park	25
St. Dunstan's, East Acton	25
St. John's, Balham	24
St. Alban's, Streatham	23
Ferme Park Baptist Church	22
St. Barnabas, Homerton	22
St. Peter's, Horndon	21

Total available for distribution about £50,000.

SUMMER GRADUATION IN BELFAST.—The summer graduation at the Queen's University of Belfast took place on July 11th in the Examination Hall. There were 200 women students on the rolls last session, and their success in the Faculty of Medicine proved remarkable. This faculty has markedly increased in numbers and of 1000 officers supplied to the Navy or Army by the University the great majority are doctors.

THE NATIONAL WELFARE AND ECONOMY EXHIBITION.—This exhibition, of which Queen Alexandra is a patron, will remain open until August 11th. It is being held at the New County Council Hall, Westminster Bridge, S.E., and the profits will be devoted to the British Red Cross Society. The exhibits cover a very wide range and deal with welfare and economy, both in the home and workshop. The care of children and the preservation and selection of food are demonstrated on the one hand, and on the other the health and comfort of the worker. Under this last heading fall the exhibits arranged by the Ministry of Munitions for the purpose of showing what is being done for the improvement of health and industrial conditions among munition workers. Sleeping accommodation provided in the hostels which are being erected to house workers imported into districts where lodgings are scarce is illustrated by a small cubicle for one girl worker and a double cubicle for two friends. These are particularly interesting as showing economy of fitting under healthy conditions. A model dining-room and kitchen has been fitted up by the Carron Iron Company, and a munition workers' canteen such as is to be seen in many controlled munition establishments has been arranged by the Richmond Gas and Meter Company, Warrington. A model hospital ambulance room shows how and where minor accidents and illnesses can be dealt with among munition workers; Messrs. Reynolds and Branson and Messrs. Cuxson Gerrard and Co. exhibit in this connexion sterilised dressings and appliances modelled on the suggestions of the Home Office and of the Health of Munition Workers Committee. In the same section is a display of various garments used by workers when filling shells or dealing with corrosives. Cloak-room accommodation designed to provide privacy without wasting space is well demonstrated by the Crittall Steel Furniture Company. A small crêche represents the kind of provision made in many populous districts for the care of infants of women munition workers and is an excellent example of what such a nursery should be; and here may be mentioned the exhibit of the Glaxo Company, which practically demonstrates most of the things which a mother ought to know if she wishes to rear a healthy child. Dolls dressed as babies, mothers, nurses, and "Gamps" take a prominent part in this objective teaching. Other exhibitors are the Jeyes' Sanitary Compounds Company, 64, Cannon-street, E.C., and Messrs. Brown and Polson, 6, Bouverie-street, E.C., while food economy, children's welfare, and agricultural societies are well represented. The exhibition is not yet complete, but there is a sufficiency of exhibits, lectures, and demonstrations on domestic and national economy to make a visit to it valuable.

ROYAL COLLEGE OF SURGEONS OF ENGLAND: ELECTION OF PRESIDENT.—A meeting of the Council was held on July 13th, Sir W. Watson Cheyne, the President, in the chair. The President announced the results of the recent election to the Council, as already reported in THE LANCET, and stated that Mr. Harrison Cripps, being third on the poll, became substitute member for the late Sir Frederic Eve until July, 1920. Mr. Cripps, Mr. Warren Low, and Mr. James Sherren were introduced, and they made declarations in the terms of the oath prescribed by the Charter of 1800 and took their seats on the Council. It was resolved that diplomas of the Licence in Dental Surgery should be granted to three successful candidates. It was resolved to grant, in conjunction with the Royal College of Physicians of London, Diplomas of Public Health to five successful candidates. The thanks of the Council were given to Mr. Alban Doran for the gift of several valuable books to the library; to Sir William Osler for presenting a manuscript letter by G. J. Guthrie, President of the College in 1833, 1841, and 1854, addressed to Inspector-General William Fergusson on the subject of field surgery and wounded in the Peninsula; and to Mr. W. E. Dring, of Tenterden, for presenting to the College a crayon portrait of Robert Liston, presented by him in 1834 to Robert Swinford Francis, one of his first pupils and dressers. The following appointments were made:—Hunterian professors: Arthur Keith, six lectures on the Anatomical and Physiological Principles Underlying the Treatment of Bone and Joint Injuries; Jonathan Hutchinson, one lecture on the Surgical Treatment of Trigeminal Neuralgia; William Tindall Lister, one lecture on the Pathological Aspect of Certain War Injuries of the Eye: Percival Pasley Cole, one lecture on the Treatment of War Injuries of the Jaws and Face; Edward Kenneth Martin, two lectures on Projectile Fracture of Limb Bones; and Hildred Carlill, one lecture on Syphilis of the Nervous System. Arris and Gale lecturers: Frederick Gymer Parsons, one lecture on Research on the Structure of the English Skeleton; and William Wright, two lectures on the Quaderni d'Anatomia by Leonardo da Vinci. Erasmus Wilson lecturer: Samuel George Shattock, six demonstrations on Surgical Pathology. Arnott demonstrator: Arthur Keith, 14 demonstrations to form a continuation of the Hunterian lectures.

Surgeon-General Sir George H. Makins was elected President and Mr. Charters J. Symonds and Mr. W. F. Haslam were elected Vice Presidents. Mr. Cripps was elected a member of the Executive Committee of the Imperial Cancer Research Fund in the place of the late Sir Frederic Eve. The President was appointed a member of the Committee of Reference.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.—The annual provincial meeting of this society was held at Birmingham on June 30th, Dr. John Robertson, the President, being in the chair. Mr. T. W. N. Barlow opened a discussion upon the status of the medical officer of health in relation to the proposed Ministry of Public Health. He considered that an immediate end should be made of a system whereby seven or eight different Government departments dealt with matters affecting the health of the community, with consequent overlapping, overstaffing, and increase of expense. Unification was as necessary at the periphery as at the centre, and there should be one body locally to deal with all questions affecting public health. The predominant nucleus of that body should be the existing health committees of large urban councils, county borough councils, and county councils, for the reason that they already had large experience in such matters and they were under the control of the ratepayers who would have to supply them with funds. There would have to be a person appointed to advise this body, and to supervise, coördinate, and control all agencies having for their object the improvement of public health. That person should be the one who had already organised tuberculosis work, maternity and child welfare centres, school medical work, and the ordinary work of a public health department. He could not agree with any proposal for the appointment of dual officials, one administrative, the other clinical. The President felt that there was a lack of appreciation of what had been done directly and indirectly by medical officers of health in preventive medicine. The records of results attained in this country justified the claims of the medical officer of health to be the head of the new department. Dr. A. Bostock Hill said that the general practitioner was still in fear of the Local Government Board on the one hand and of the administrative officer on the other. The coming together of the general practitioner and the medical officer of health would be to their mutual advantage, for public health was developing on the lines of medicine rather than on those of pure science. Dr. G. F. Buchan was of opinion that the care of the individual would have to be the main conception of the Ministry of Public Health, which must have expert advisers possessed of organising ability and imagination of a sort trained to deal with health problems. Lieutenant-Colonel Herbert Jones, Mr. T. O. Halliwell, Dr. S. Barwise, and Dr. E. H. Snell also took part in the discussion.

A QUESTION OF FEES.—At Co. Fermanagh Assizes an important case was heard recently, Dr. E. C. Thompson, surgeon to the Co. Tyrone Infirmary, Omagh, sued the Lisnaskea board of guardians for £12 12*s.* in payment of three special consultation visits to the workhouse hospital. He had motored 31 miles on each occasion and he said that, owing to the increased cost of petrol and other necessaries, he could not take his former fees of £9 9*s.* After medical evidence had been tendered in support of Dr. Thompson's claim Mr. Justice Madden gave a decree for the full amount.

IN a sympathetic notice of Sir Armand Ruffer in a recent number of the *Paris Médical* Professor Jules Guiart states that the Greek Army has arranged to perpetuate the memory of a great benefactor, and Generale Comnéne, War Minister to the National Government, has directed that one ward in every Greek hospital shall in future bear the name of Ruffer.

MEDICAL MAGISTRATE.—The name of Mr. Peter Buchanan, M.B., C.M. Glasg., has been added to the Commission of the Peace for the County of Gloucestershire.

ROYAL ALBERT HOSPITAL, DEVONPORT.—A special meeting of the governors of the Royal Albert Hospital was held last week, under the presidency of Lord St. Levan, to consider the serious financial position of the institution. It was stated that the present adverse balance of the hospital was £1257, and it was estimated that by September the deficit would be £2857. After some discussion it was unanimously resolved to sell stock which would realise about £2100.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Military Service (Review of Exceptions) Act: Western Command and London.

THE Select Committee of the House of Commons which is investigating the subject of the medical examination of recruits for the Army, particularly in relation to the Military Service (Review of Exceptions) Act, has heard further evidence.

On Wednesday, July 11th, Surgeon-General HATHAWAY gave evidence in regard to the work of medical boards during the time he was D.D.M.S. on the Western Command. He had visited nearly all the boards in that area. When he heard that there was dissatisfaction with any particular board he inspected it himself, or sent some officer experienced in recruiting to examine the matter at the earliest possible moment. He had ceased to act in the Western Command about the last week in June. In the Western Command, taken as a whole, the medical boards worked harmoniously. A very large portion of the evidence was directed to individual cases arising in Manchester and Liverpool in connexion with medical examinations.

Colonel C. R. TYRRELL, A.D.M.S., London District, spoke as a witness of the composition of recruiting medical boards in London. Members of those boards, he said, felt very much that they were abused.

Mr. SUTTON (a member of the Committee) said that they were abused by civilian members of their own profession all over the country.

Mr. MOONEY (who was acting as chairman): Your opinion is that the doctors have done their work well?

Colonel TYRRELL: That is my opinion.

Mr. MOONEY: And they are working under very adverse circumstances?

Colonel TYRRELL: That is my opinion. They deserve credit and thanks rather than blame.

On Thursday, July 12th, Sir RYLAND ADKINS, K.C., M.P., gave evidence based on his experience as a member of the Northamptonshire Appeal Tribunal. His general impression was that the arrangements for medical examinations and re-examinations were not working in a way which gave the tribunals as much assistance as he thought they would be glad to receive. There had been very remarkable contrasts in the classification of men who came before his tribunal. The impression forced on his mind was not that the medical men concerned were not men of ability and devotion, but they were overworked and had to do things too quickly. Therefore the results which they arrived at were wanting in weight. There was now a feeling of uncertainty and variableness which made it very difficult to send to the Army everyone who ought to go in and keep out men who would be better out than in. He thought that the delay in sending men to the central medical boards should be obviated, and that other boards of this kind should be set up at other places than London and Leeds. At present he pointed out there was no security that once in the Army a man's classification would not be raised by an officer over whom the tribunal had no control. He suggested that there should be a medical tribunal to whom a man could appeal on having his category raised by his commanding officer and his medical officer. He would be glad if the classification could only be raised by a medical board. That would do much to re-establish public confidence in districts where it had been seriously impaired.

Mr. A. RICHARDSON, M.P., chairman of the Law Society's Appeal Tribunal, also gave evidence. He expressed the view that medical boards were at present without effective supervision.

The Mesopotamia Commission Report.

Both Houses of Parliament on Thursday, July 12th, and Friday, July 13th, discussed the report of the Mesopotamia Commission, and the main trend of the debate turned upon the nature of the inquiry which was to be instituted to investigate the actions of persons, military and civil, who were affected by the Report. The Government at first indicated that in its view a court of inquiry should be set up under the provisions of the Army (Courts of Inquiry) Act, 1916, consisting of two persons who had held high judicial office and three officers. A specially appointed statutory commission was suggested as an alternative in the course of the debate. Mr. LLOYD GEORGE intimated that if the House of Commons preferred the second alternative as the best method of getting at the truth, the Government was prepared to submit proposals carrying it into effect. There was no desire to shield anyone who was in the least to blame for the terrible catastrophe in Mesopotamia. From the Government bench certain criticisms were passed on the methods by which the Commission had arrived at its findings. Mr. CHAMBERLAIN announced his resignation of the office of Secretary of State for India. The Prime Minister said that there was nothing in the report of the Commission to justify the right honourable gentleman feeling that he ought to have resigned.

On Wednesday, July 18th, Mr. BONAR LAW said that in view of the considerations urged during the recent debates and the objections raised to further inquiry as a preliminary to executive action in case of persons implicated in the Mesopotamia report, whether the inquiry were by any existing tribunal or by a special statutory court to be set up for this purpose, H.M.'s Government had decided not to proceed further with their former suggestion. As regarded the soldiers, the Government had decided that they should be dealt with by the Army Council in the ordinary way.

Public Health (Prevention and Treatment of Disease) (Ireland) Bill.

A Bill has been introduced in the House of Commons by Mr. DUKE, Chief Secretary for Ireland, "to amend Section 148 of the Public Health (Ireland) Act, 1878, as respects the prevention and treatment of disease in Ireland." It is in the following terms:—

1.—(1) The Local Government Board for Ireland shall have power to declare that one of the authorities to execute and enforce regulations made by the Board under Section 148 of the Public Health (Ireland) Act, 1878, with a view to the treatment of persons affected with cholera or any other epidemic, endemic or infectious disease, and preventing the spread of cholera and such other diseases, shall be the council of a county, and that section shall have effect accordingly as if a county council were an authority within the meaning of that section:

Provided that, except in case of emergency, the Board shall not require the council of a county to execute and enforce any such regulations without the consent of the council.

(2) Any expenses incurred by the council of a county in the execution or enforcement of such regulations shall be raised as a county at large charge.

2. This Act may be cited as the Public Health (Prevention and Treatment of Disease) (Ireland) Act, 1917, and may be cited with the Public Health (Ireland) Acts, 1878 to 1907, as the Public Health (Ireland) Acts, 1878 to 1917.

The Bill was read a second time on Tuesday, July 17th.

HOUSE OF COMMONS.

THURSDAY, JULY 12TH.

War Bread and Invalids.

Mr. ROWNTREE asked the Parliamentary Secretary to the Ministry of Food whether his attention had been called to the deleterious effect of war bread upon the health of many aged persons and invalids; and whether in *bonâ-fide* cases of necessity certified by a doctor he would consider the possibility of permitting the use of ordinary flour.—Mr. BRIDGEMAN replied: Applications for the use of special flour in the manufacture of bread, when supported by a doctor's certificate, are considered by the Ministry of Food, and licences are granted on the recommendation of a special board appointed by the Royal Society.

Pay of Medical Officers.

Colonel GRETTON asked the Financial Secretary to the War Office whether he was aware of the disparity between the pay of medical officers belonging to the Territorial Force and officers who had recently joined the Royal Army Medical

Corps; whether he was aware that majors serving as medical officers in the Territorial Force received the same pay as a recently joined lieutenant of the Royal Army Medical Corps; would he state what were the reasons of this disparity; and was it proposed to take any steps to put experienced medical officers of the Territorial Force in the same position as officers of the Royal Army Medical Corps.—Mr. FORSTER wrote in reply: The Territorial Force officer is paid at the same rate as the regular R.A.M.C. officer of the same rank and service, except that only embodied service counts for increase of pay in the same rank. The comparison which my honourable and gallant friend wishes to make is probably that between the pay of the Territorial Force officer and of the temporary officer engaged on special contract terms during the war. When allowances and terminal gratuities are taken into account, the major of the Territorial Force receives considerably more than the special contract officer.

MONDAY, JULY 16TH.

Admiralty Payments to Surgeons.

Mr. FRENCH asked the Secretary to the Admiralty whether he was aware that the local surgeons and agents of the Admiralty were receiving only 2*s*. 6*d*. per patient for professional attendance and supplying medicine to the coast-guards and men of the Royal Navy and 1*s*. per mile one way for locomotion expenses; whether applications had been received from any of these officers requesting an increase of these rates of pay; and whether, having regard to the increased cost of living and the cost of drugs and petrol, he would see his way to recommend an advance of fees and allowances so as to ensure that surgeons and agents might, without loss to themselves, do justice to their patients and receive fair remuneration for their services.—Mr. MACNAMARA replied: The rates of remuneration are, with a few exceptions, in which higher rates are warranted by the circumstances of the case, 2*s*. 6*d*. each visit to or consultation with each patient (and not, as the question may perhaps imply, 2*s*. 6*d*. per case), with mileage allowance as stated. Only one application for increased remuneration has been received during the past year, although there are some 580 surgeons and agents. In the circumstances a case for a general increase of fees and allowances has not been established.

Referring to a further question relating to delays in the payments, Mr. MACNAMARA said: The suggestion that the surgeons' and agents' claims are always almost three months overdue before they are fully paid is not borne out by the facts. For instance, of 228 received in April and May for the period ended March 31st last, between 84 and 85 per cent. were finally paid in less than two months from date of receipt, 70 per cent. being settled in less than six weeks. Arrangements have, moreover, been in force since an early date in the war, by which payments on account amounting to two-thirds of any claim exceeding £10 or thereabouts are made immediately upon their receipt.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

POPE, HENRY BROUGHAM, B.A., M.D., B.Ch. (T.C., Dub.), has been appointed Medical Officer of Health for Clevedon (Somerset).

To be Certifying Surgeons under the Factory and Workshop Acts: MCINNES, A., L.R.C.P. Edin., L.R.C.S. Edin., L.F.P.S.G. (Raunds District of the county of Northampton); MCKINNEY, B. W., M.B., Ch.B. Belf. (Lisnaskea District of the county of Fermanagh); WALSH, F. P., L.R.C.P. Edin., L.R.C.S. Edin., L.F.P.S.G. (Rosscarberry District of the county of Cork).

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

THE Chief Inspector of Factories, Home Office, London, S.W., gives notice of vacancies for Certifying Surgeons under the Factory and Workshop Acts at Hendon, in the county of Middlesex; and at Castleford, in the county of Yorks.

Births, Marriages, and Deaths.

BIRTHS.

BAREFOOT.—On July 15th, at Cecil Mansions, Balham, the wife of Captain H. J. L. Barefoot, R.A.M.C.T., of a son.

DORNHORST.—On July 13th, at Manor-road, Stamford-hill, the wife of Dr. Hubert Dornhorst, of a daughter.

HARVEY.—On July 14th, at Primrose Mansions, Battersea Park, S.W., the wife of Major G. A. D. Harvey, R.A.M.C., of a daughter.

MOORE.—On July 11th, at St. Paul's-road, Clifton, the wife of Clifford A. Moore, M.S., F.R.C.S., Captain, R.A.M.C., of a son.

PEACOCK.—On July 12th, at the Pemberton Nursing Home, St. John's Park, North, the wife of H. Maurice Peacock, of Epsom—a daughter.

VALENTINE.—On July 12th, at Granada House, Southsea, the wife of Lieutenant J. A. Valentine, R.A.M.C. (Temp.)—a son.

WARNER.—On July 11th, at Courtleigh, Finchley-road, Golder's-green, the wife of Captain E. Lloyd Warner, C.A.M.C., of a daughter.

WILKINSON.—On July 15th, at Cottesmore, Sutton, Surrey, the wife of Captain John Douglas Wilkinson, R.A.M.C., of a son.

MARRIAGES.

HILL—KENNY.—At Aldershot, St. Joseph's R.C. Church, J. F. Hill, Captain, R.A.M.C., attached the Inniskilling Dragoons, B.E.F., France, to Kathleen Josephine, daughter of Mrs. Kenny, Abbey Street, Roscommon, Ireland.

DEATHS.

LEAHY.—On July 17th, at 4, Iddesleigh Mansions, Victoria-street, S.W., after a long and trying illness, Lieutenant-Colonel A. W. D. Leahy, M.D., F.R.C.S., late I.M.S.

PETER.—On July 5th, died from wounds, Captain Alastair Gordon Peter, M.C., R.A.M.C., M.A., M.B., Ch.B. (Aberd.), L.R.C.P. (Lond.), M.R.C.S. (Eng.), D.P.H. (Camb.).

RAYNER.—On July 9th, killed in an explosion on board on H.M.S. *Vanguard*, Edward Rayner, Surgeon, R.N., M.B. Cantab., F.R.C.S. Eng.

ROSE.—On July 7th, from wounds received in action, Captain Harold E. Rose, R.A.M.C.

STEWART.—On July 12th, at his residence, Hollywood, Pendleton, Manchester, Alexander Stewart, M.D., J.P., aged 62 years.

TWEEDY.—On July 12th, at Newquay, Cornwall, Reginald Carlyon Tweedy, M.D., &c., of Kenilworth, late temporary Major, R.A.M.C.

VAUX.—On July 11th, at Sunderland, Ralph Thomas Vaux, M.B., B.S.

WILSON.—On July 13th, at St. Hilda's-terrace, Whitby, William Henry Wilson, M.B., C.M., aged 47.

*N.B.—A fee of 5*s*. is charged for the insertion of Notices of Births, Marriages, and Deaths.*

Notes, Short Comments, and Answers to Correspondents.

HERB-GROWING AND COLLECTING.

A MEETING to further the interests of the National Herb-Growing Association was recently held at Plymouth. The secretary stated that since the formation of the society in September, 1914, 120 branches had been established and during the first year of its work the association had supplied 100 tons of herbs to the manufacturing chemists. They had also recently received an order for 100 tons of dandelion roots for India. The meeting finally passed a resolution approving of the work of the society and promising support to a scheme for the provision of a drying-shed in or in the neighbourhood of Plymouth.

The work of the amateur herb-grower will be greatly facilitated by reading a pamphlet drawn up by Mrs. M. Grieve, of the Whins Vegetable Drug Farm, Chalfont St. Peter, Bucks, entitled "Vegetables from the Hedgerows," and giving an account of the many wild plants of our fields and hedges that have been employed as vegetables and salads, as well as those which may be used as substitutes for tea and coffee. Our native fruits are also enumerated. Mrs. Grieve is no mere enumerator, but, whether as writer or pupil trainer, obviously possesses an enthusiasm for her subject which enables her to give much useful and accurate information in an attractive manner.

THE NEEDS OF WAR PENSIONERS.

It has been brought to the notice of the Ministry of Pensions that a number of pensioners are appealing to the charitable on the ground of insufficient means. The Local War Pensions Committee, whose address is obtainable from the nearest Post Office, have ample powers for dealing with all deserving cases of this nature from public funds, and the charitable public should refer such applicants to this body.

M.D.—The adjective was applied to the non-odorous purulent discharges from injuries, abscesses, or wounds, surgical and other, which were pursuing a normal course in pre-Listerian times.

J. L. M. is referred to a note on depilatories on p. 825 of THE LANCET of May 26th.

CORRECTION.—The address of the Sterling Corporation Ltd. is 16, Wigmore-street, London, W. 1.

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.*

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

Offices: 423, STRAND, LONDON W.C. 2.

MANAGER'S NOTICES.

VOLUMES AND CASES.

VOLUMES for the first half of the year 1917 will be ready shortly. Bound in cloth, gilt lettered, price 21*s.*, carriage extra.

Cases for binding the half-year's numbers (inland edition) are now ready. Cloth, gilt lettered, price 2*s.* 6*d.*, by post 2*s.* 10*d.*

To be obtained on application to the Manager, accompanied by remittance.

SUBSCRIPTION RATES.

INLAND.

One Year	£1	10	0
Six Months	0	16	0
Three Months	0	8	0

COLONIES and ABROAD.

One Year	£1	12	6
Six Months	0	17	6
Three Months	0	8	9

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Offices, 423, Strand, London, W.C. 2.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C. 2, are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION is published in time to catch the weekly Friday mails to all parts of the world.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

Subscribers abroad are particularly requested to note the rates of subscriptions given above.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the above rates, whatever be the weight of any of the copies so supplied.

NEWSPAPERS FOR NEUTRAL COUNTRIES.

Newspapers are not at present being sent forward to neutral European countries unless posted direct from the office of publishers or newsagents who have obtained permission from the War Office for this purpose. The Publisher of THE LANCET has obtained the required permission, and he will forward copies direct from the Office to any neutral country on receipt of instructions.

Oxalic Acid Crystals.

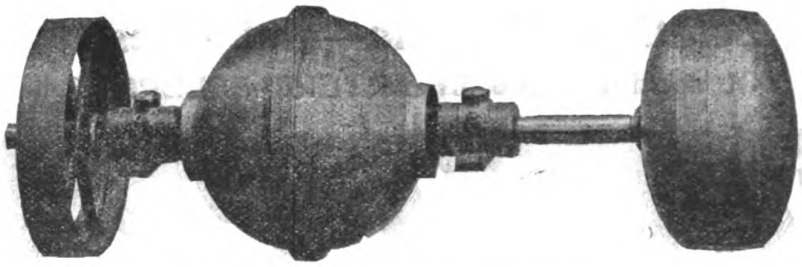
GOLD MEDAL, LONDON, 1908
Grand Prix, Nancy and Quito, 1909

COMMUNICATIONS:
Academy of Medicine, Paris, 10th Nov., 1908.
Academy of Sciences, Paris, 14th Dec., 1908.

URIC ACID is never found free in the organism. It always exists in a state of combination with Soda, Ammonia, &c.; it forms biurates or quadriurates, which are complex and not easily soluble.

URODONAL by reason of its special composition, is able to effect the double chemical decompositions which liberate the Uric Acid from the combinations where it is fixed, and cause it to be easily eliminated in the urine.

URODONAL is a most powerful solvent of **URIC ACID,** because it can destroy its organic combinations.



URODONAL.—Price 5/- and 12/- per bottle (latter size equals three 5/- bottles).
Prepared exclusively by **J. L. CHATELAIN,** Ph. Chemist, 2 & 2 bis, rue de Valenciennes, Paris.
Can be obtained from all Chemists and Stores, or from the London and Colonial Agents,

"THE HOUSE FOR EVERYTHING ELECTRO-MEDICAL."

The Grevillite Therapeutic Incandescent Lamp

(PHOTOTHERAPY). PRICE COMPLETE - £15.

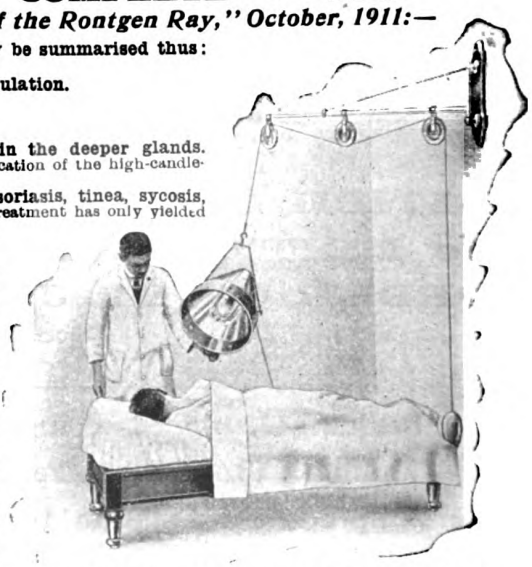
The following is an extract from the "Archives of the Rontgen Ray," October, 1911:—

The physiological effects of this form of photo-therapy may be summarised thus:
1. Dilation of superficial vessels and glands.
2. Removal of venous stasis and promotion of normal circulation.
3. A bactericidal action on superficial germs.

And as a practical result of these principles we get—
1. Relief of pain.
2. Restoration of functional activity both in the skin and in the deeper glands.

It will be easily seen how broad a field there is for the clinical application of the high-candle-power lamp, and how many indications there are for its use.

In the treatment of some **skin diseases**, notably **acne, eczema, psoriasis**, tinea, sycosis, **syphilitic** and **other ulcers**, I have found this **succeed** where other treatment has only yielded disappointing results.



In the relief of pain I think this form of treatment stands pre-eminent in the armament of the modern electro-therapeutist. I venture to assert that where after a scientifically applied exposure to this light no relief is obtained, it may be taken that the case should be promptly referred to the surgeon. And there are some cases where the light will cause the pain to become more acute; this differentiates those cases of retained, walled-in pus which have gone beyond the power of phagocytes and opsonins, and which call for immediate operative interference.

The cases of pain which are more particularly benefited are **rheumatic** and **rheumatoid** disease, **sciatica** and other forms of **neuritis, lumbago** and the varying conditions which are classed under that generic term, and certain **functional diseases of the digestive system**, especially **gastric irritability** and pain.

In certain classes of **neurasthenia** and **insomnia**, the light passed up and down the spine for ten or twelve minutes, and then applied for a similar period to the abdomen, will produce a marked relief, and eventually a **cessation of all symptoms.**

In addition to its power of curing **obstinate acne**, the light will in many cases abort a **bubo** or **carbuncle** before the pus has formed in any great quantity. In those cases it is a great aid as a diagnostic agent, for if the pain be relieved within ten or twenty minutes it is certain that repeated applications will effect a cure; whereas if the pain becomes worse—and this will occur in the first few minutes—it is certain that nothing but the surgeon's knife will relieve the condition.

NOTE.—For further particulars see separate pamphlet.

A really Universal Light and Heat Apparatus for the treatment of any part of the body.

To the Medical Profession.

THE

EAGLE

AND

BRITISH DOMINIONS

INSURANCE COMPANY, LIMITED,

desire to express to the Medical Profession their appreciation of the valuable services rendered by its members in connection with the War Loan Insurance Scheme inaugurated and carried out by the Company.

Owing to the limited time imposed by the conditions under which the Loan was issued and the extraordinary volume of business submitted to the Company, it proved impossible, with the necessary new auxiliary staff, to keep everything in its customary order, and if there are any members of the Medical Profession who have fees due to them for examination they are asked kindly to communicate immediately with the Company.

The
NORWICH

CREPE BANDAGE

SUPERIOR ENGLISH MANUFACTURE
Extremely elastic, but contains no rubber
FAST WOVEN EDGES.

"I always advise the Norwich Crêpe Bandage for reasons of Hygiene and Comfort."

THE BANDAGE THAT CAN BE STERILIZED.

IMPORTANT.
THE EDGES WILL NOT FRAY OUT NOR RAVEL.

Invaluable for all binding purposes. Entirely displaces bandages of rubber and elastic web. Considerably more durable, although less than one-third the cost of rubber or elastic web.

WOOL v. COTTON
Sterilized Bandages.

Patients having varicose veins and other ailments requiring the use of bandages usually suffer from cold extremities due to bad circulation. They require *warmth* as well as support. The Norwich Crêpe Bandages, containing wool provide this warmth and do not absorb grease so readily as those made of cotton. Moreover, they may be thoroughly cleansed by the use of *hot* (not boiling) soapy water, with the addition of a little ammonia or soda. The bandages are healthy and comfortable to wear, giving the necessary firmness, yet yielding to every movement. Self-clinging and self-adjusting.

The Norwich Crêpe Bandage is made and supplied to the leading wholesale houses, neatly wrapped in labelled packages. Its inexpensiveness, compared with foreign productions, and its high quality, universally commended by the medical and nursing professions, make it ideal for sufferers from varicose veins and for all purposes where bandages are required. Send for prices and samples to the sole manufacturers:

THE NORWICH CRAPE CO. (1856) LTD.,
St. Augustine's Silk Mills, Norwich, Eng.

London buyers can obtain samples and prices from Mr. T. Eastaway, London representative, 7, Wool Exchange, E.C. 2

Antikamnia Tablets

Strongly Recommended in:

INFLUENZA & LA GRIPPE

For the headache, pain, and general soreness give a five-grain Antikamnia Tablet crushed with a little water; if the pain is very severe two tablets should be given. Repeat every 2 or 3 hours as required. One single ten-grain dose is often followed by complete relief.

NEURALGIA

In the Treatment of Neuralgia and Myalgic Pains Antikamnia Tablets are not only palliative, but, along with other measures, assist in ultimate cures; they also have a field of use in Rheumatic and Gouty Affections. In Neurasthenia, Hysteria, and Migraine they are a valuable adjuvant to the other recognised therapeutic measures.

LARYNGEAL COUGH

Frequently remains after an attack of La Grippe, and has been found stubborn to yield to treatment. There is an irritation of the larynx, huskiness, and a dry and wheezing cough, usually worse at night. The prolonged and intense paroxysms of coughing are controlled by **ANTIKAMNIA & CODEINE TABLETS,** and with the cessation of the coughing the laryngeal irritation subsides.
Antikamnia Tablets are the least depressing of all the drugs that can exercise so extensive a control of pain, and also least disturbing to the digestive and other organic functions.

Analgesic. Antipyretic. Anodyne.

Antikamnia Preparations in 1-oz. packages only.

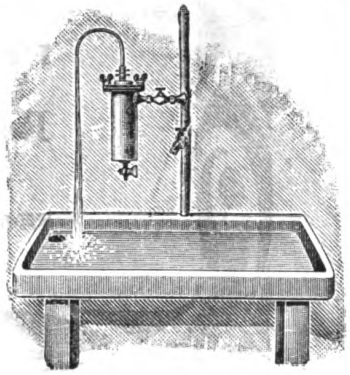
The Importance of Perfect Filtration.

The demands of the Government for satisfactory Filters during the present war amply demonstrate the importance of a regular supply of pure water.

The high degree of general health of British troops engaged on the various fronts proves the wisdom of insisting on perfect filtration of all drinking water.



THE BROWNLOW FILTER. . . . . .

continues – it has done so for nearly ninety years now—to give the highest satisfaction, and Medical Men may, with perfect confidence, recommend its regular use wherever a filter is considered desirable, regardless alike of country or climate.

Explanatory literature and all information gladly sent on request to the Manufacturers –

THE "RAPID" SERVICE FILTER

Red Cross Work
THE BURBERRY

beats every other form of protection, however severe the conditions.

Unlike rubberproofs, or weatherproofs interlined with oiled silk, **THE BURBERRY** is free from the unhealthy heat engendered by airtight fabrics.

Another advantage of **THE BURBERRY** is the permanence of its proofing. Rubber and interlined coats are spoilt by any extreme of cold or heat, but **THE BURBERRY**, owing to the protective agent being ingrained in every thread of the cloth, retains its unrivalled weather resisting properties throughout the roughest usage in any climate.

BURBERRY SERVICE DRESS

for Doctors and Surgeons, comprises every detail of equipment, including Uniforms and Greatcoats, made from hard wearing cloth, proofed by Burberry processes.

POWDER TABLETS, ELIXIR

First Class Award for Liquors and Liquid Extracts and Pharmaceutical Preparations International Medical Exhibition, London, '81.

Battley's Liquors

First Class Award at World's Industrial Exposition, New Orleans, 1885, Bronze Medal, St. Louis, 1904.

The following preparations have for many years been used and prescribed by medical men; they are therefore thoroughly recommended both on account of their high therapeutical properties and their great purity as galenical preparations.

Liquor Opii Sedativus (Battley)
Dose: 5 to 15 minims.
The Oldest and still the Best Hypnotic and Sedative.
Twice the strength of Tinctura Opii B.P.
Safe in use. No disagreeable after effects.
Composition always reliable.

Liquor Cinchonæ Cord. (Battley)
Dose: 2 to 15 minims.
The most reliable preparation of Cinchona Bark.
Contains all the active principles of Yellow Bark.
Will remain unaltered for a great length of time, being free from starch, etc.

Liquor Cinch. Pallidæ (Battley)
Dose: 2 to 15 minims.
A well-known and useful preparation in Malarial Diseases and in Convalescence after Illness.
Does not disturb the stomach.

Liquor Secalis Cornuti (Battley)
Dose: 20 to 60 minims.
Pre-eminent among Ergotic Preparations for Purity and Strength, and has proved to be unrivalled in the following therapeutical actions:—As an Emmenagogue and Ecbolic, in Post Partum Hæmorrhage, as a Hæmostatic, etc.

Battley's Liquors are issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.
They are prepared according to the original process of the late Richard Battley.

VALE OF CLWYD SANATORIUM

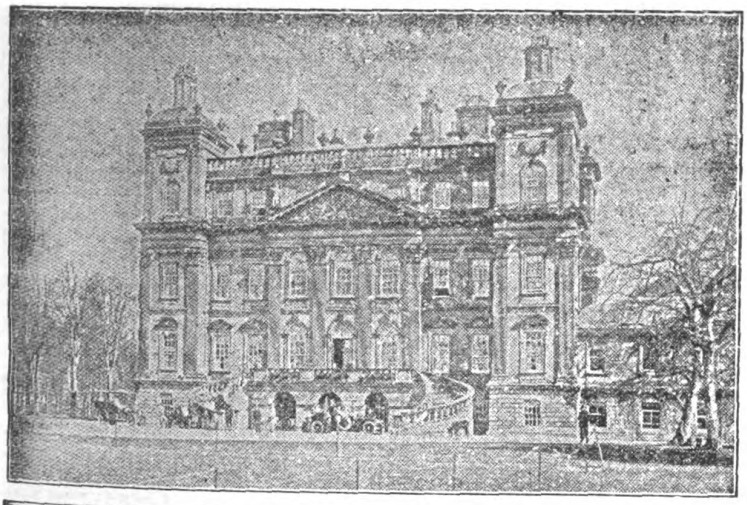
This Sanatorium (opened 1901) is established for the Treatment of Tuberculosis as carried out by Dr. OTTO WALTHER of Nordrach. It is situated in the midst of a large area of park-land, at a height of 450 feet above the sea-level, on the western slopes of mountains rising to over 1800 feet, which protect it from North and East winds and provide many miles of carefully graduated uphill walks—similar in character and extent to those at Nordrach.

Small rainfall. Porous subsoil. Large amount of sunshine. Electric Lighting and Hot Water Radiators in each room.

The physician himself was a patient at Nordrach.

For particulars, apply to GEORGE A. CRACE-CALVERT, M.B., &c., Llanbedr Hall, Ruthin, North Wales.

PENDYFFRYN HALL SANATORIUM



(NORDRACH-IN-WALES.)

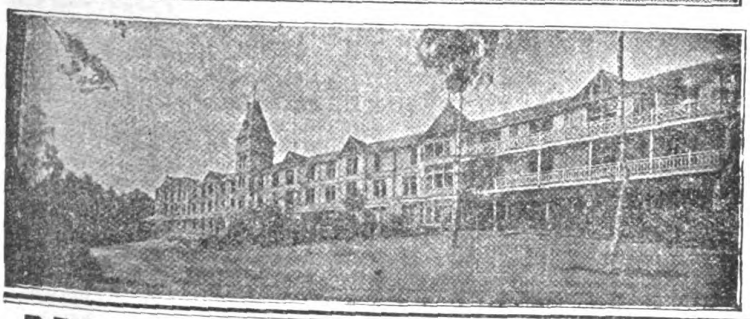
Physicians: Dr. G. M. DOBSON and Dr. GERATY.

FOR THE OPEN-AIR AND INOCULATION TREATMENT OF ALL FORMS OF TUBERCULOSIS.

One of the first Sanatoria opened in the United Kingdom to carry out the treatment as practised at Nordrach. Carefully graduated walks rise through pines, gorse, and heather to a height of over 1000 feet above sea level, commanding extensive views of both sea and mountains. Sheltered from E. and N.E. winds. Climate mild and bracing. Small rainfall. Large average of sunshine. There are over five miles of walks in the private grounds. Rooms heated by hot-water radiators and lit by electric light.

Telegrams: Pendyffryn; and Telephone: 20 Penmaenmawr. Apply, Secretary, Pendyffryn Hall, Penmaenmawr, North Wales.

DUFF HOUSE, BANFF SCOTLAND.



TREATMENT OF DISORDERS OF THE STOMACH AND INTESTINES, DIABETES, GOUT,

and other complaints which need skilled chemical investigation and dietetic treatment.

Alcresta Tablets of Ipecac in Amebic Dysentery

and in Endamebic Pyorrhea

The oral administration of the ipecac alkaloids is proving more advantageous than the hypodermatic injection of emetine, especially in the treatment of endamebic carriers and in the prevention of relapses.

UNCOATED AND DISINTEGRATING—CAUSE NO NAUSEA

Each tablet contains the alkaloids (emetine and cephaeline) from ten grains of Ipecac, U. S. P., held in an adsorption compound with hydrated aluminum silicate. The tablets disintegrate but this adsorption compound passes through the acid contents of the stomach and releases the alkaloids only in the alkaline intestinal secretions—thus preventing gastric disturbances.

Ten or twenty tablets, representing one hundred or two hundred grains of ipecac, may be given in a day without vomiting or nausea.

Distributed through the Drug and Dental Trades in bottles containing 40 and 500 tablets. Further information on request.

INDIANAPOLIS, U. S. A.

LISTERINE

the well-proven and time-tried antiseptic solution, has been prescribed by the Medical Profession with very satisfactory results for 35 years in the treatment of Respiratory Diseases incident to Fall and Winter climatic conditions.

LISTERINE

one part, hot water three parts, is a useful gargle for sore throat. In mucous catarrhs, Listerine, suitably diluted, is most effectively applied by means of the spray apparatus or douche.

LISTERINE

is not only a vehicle for specially indicated alteratives, resolvents and astringents, but is itself an efficient, non-irritating antiseptic, that is safe, pleasing to the taste, and promptly effective.

A Treatise on Respiratory Diseases will be forwarded to Members of the Medical Profession on request.

LAMBERT PHARMACAL COMPANY, Twenty-First and Locust Streets, St. Louis, Mo.

Clinical Surgical Diagnosis for Students and Practitioners.

Containing a Chapter on "**Some General Diagnostic Problems in connection with the Military Surgery of the Limbs.**" By PROF. F. DE QUERVAIN. Director of the Surgical Clinic, University of Basle. Translated by J. SNOWMAN, M.D. 862 pp., with 604 Illustrations and 5 Coloured Plates. Second English Edition. Royal 8vo. Price 35s. net. Postage: Inland 7d., Abroad 2s.

The *BRITISH MEDICAL JOURNAL* says: "We do not know of any better book of its kind."

"We have never yet seen such a uniformly beautiful collection of pictures of surgical conditions."

"A book which we think might well be in the hands, not only of practitioners of medicine in general, but also in those of teachers of surgery."

83, 85, 87, 89, 91, GREAT TITCHFIELD STREET, LONDON, W. 1.

RECENTLY ISSUED

Ashton's Practice of Gynecology

NEW (6th) EDITION

A Text-Book on the Practice of Gynecology. For Practitioners and Students. By W. EASTERLY ASHTON, M.D., LL.D., Fellow of the American Gynecologic Society; Professor of Gynecology in the Graduate School of Medicine of the University of Pennsylvania; one of the Founders of the Congrès International de Gynécologie et d'Obstétrique. Octavo of 1100 pages, with 1052 original line drawings. Cloth, 27s. 6d. net.

From its first appearance Dr. Ashton's book set a standard in *practical* medical books; that he *has* produced a work of unusual value to the medical practitioner is shown by the demand for each succeeding edition. Every procedure given has been thoroughly tested by the author himself, and not only is the reader told *what* to do, but precisely *how to do it*. A distinctly original feature consists of the 1052 illustrations, made especially under the author's personal supervision from actual apparatus, living models, and dissections on the cadaver.

Extract from Review of an earlier Edition:—

"Dr. Ashton has produced a work which, it is not too much to say, is the most noteworthy among the many works on this subject recently published. ..... A volume of sterling merit in every possible detail."

—THE PRACTITIONER.

A Complete Work

LOCAL ANÆSTHESIA

Fully Illustrated

By CARROLL W. ALLEN, M.D., Instructor in Clinical Surgery at Tulane University of Louisiana. With an Introduction by RUDOLPH MATAS, M.D. Octavo of 608 pages, 255 illustrations. Cloth, 25s. net.

"Every surgeon who wishes to place at the disposal of his patients the full advantages to be gained from recent advances in our knowledge should gladly study the records and results of Dr. Allen's work."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

Fifth Edition

NOSE AND THROAT

A Standard Work

By D. BRADEN KYLE, M.D., Professor of Laryngology, Jefferson Medical College, Philadelphia. Octavo of 825 pages, with 258 illustrations. Cloth, 20s. net.

"The book is a valuable contribution to medical literature, and has already exercised considerable influence on practice."

—BRITISH MEDICAL JOURNAL.

Treatment—A Noticeable Feature

PRACTICE OF PEDIATRICS

For the Practitioner

By CHARLES GILMORE KERLEY, M.D., Professor of Diseases of Children, New York Polyclinic Medical School and Hospital. Octavo of 878 pages, illustrated. Cloth, 25s. net.

"The most noticeable feature is the amount of attention paid to the general management of children in health and disease."

—BRITISH JOURNAL OF CHILDREN'S DISEASES.

REDUCTION

IN THE

COST of INSURANCE

It is but bare justice to the Motor Car Owner that the cost of Insurance should be reduced in a reasonable proportion to the restriction of the use of cars consequent upon Petrol shortage and Government Regulations.

The EAGLE AND BRITISH DOMINIONS INSURANCE CO., Ltd., announce a new special policy for Motor Car Owners at heavily reduced premiums to meet the present new conditions, the Company taking the risk of the restrictions being removed or relaxed before the expiry of policies which will be issued for 12 months.

This Special Policy applies only to Private and Doctors' Cars.

PREMIUMS for TWELVE MONTHS' POLICY

Covering Accidental Damage, Third Party Risk, Medical Expenses, Personal Accidents (other than fire or theft).

Where Proposer's Petrol Licence has not been renewed	£3 15 0
Where Proposer's Petrol Licence is limited to not more than—	
(*a*) 10 gallons per month	4 0 0
(*b*) 20 gallons per month	5 10 0
(*c*) 25 gallons per month (applying only to cars of 20 h.p. and over)	8 0 0
(*d*) Over 25 gallons per month.	Rates on application.

Large rebates to owners insuring two or more cars up to 40% of premiums.

Extra benefits covering every liability at slight percentage additions.

Substantial reductions to owners bearing proportion of claim up to 50% of total premium.

Special rates for Commercial Cars on application.

For proposal form, with full detailed particulars, write—

SAUNDERS'
BOOKS FOR STUDENTS

THE NEW WORK ON PATHOLOGY

MacCallum's Pathology

Dr. MacCallum's new work presents pathology from an entirely new angle. Most text-books on pathology consider the diseases of each organ separately under the name of the organ as a heading. Dr. MacCallum's book, however, considers pathology on the principle that practically every pathologic condition is the direct or indirect effect of an injury; that is, the direct effect or the immediate or remote reaction of the tissues. Tumours alone cannot be brought under this category. In a word, this book presents *pathology on the basis of etiology.* The treatment is not limited to anatomic and morphologic descriptions, but functional disturbances are discussed, as well as those of chemical character. The entire work is based upon the study of the material itself, and practically all the illustrations were made direct from those particular specimens studied. There are some 400 of these accurate and superb illustrations, very many of them in colours.

The work is particularly well adapted for teaching purposes—it is essentially a text-book, although practitioners generally and those interested in pathology will find in this book many new facts capable of practical application in the practice of medicine and surgery.

TEXT-BOOK OF PATHOLOGY. By W. G. MACCALLUM, M.D., Professor of Pathology, College of Physicians and Surgeons, New York. Octavo of 1085 pages, with 575 original illustrations, many in colours. Cloth, 35s. net.

Pathologic Histology

PATHOLOGIC HISTOLOGY. By FRANK B. MALLORY, M.D., Associate Professor of Pathology at Harvard Medical School. Octavo of 677 pages, 497 figures (683 original illustrations), 124 in colours. Cloth, 24s. net.

Recently Issued.

"*We urgently recommend it to all students of pathology.*"
—DUBLIN JOURNAL OF MEDICAL SCIENCE.

Surgery

SURGERY: ITS PRINCIPLES AND PRACTICE. Edited by W. W. KEEN, M.D., LL.D., Hon. F.R.C.S. Eng. & Edin. Six large octavos averaging 1050 pages each, containing 3100 original illustrations, 157 in colours.
Per volume: Cloth, 30s. net; Half Morocco, 24s. net.

The Greatest Surgery of the Age.

"*The most complete and valuable system of surgery which has hitherto been published.*"—EDINBURGH MED. JOURNAL.

Embryology

LABORATORY MANUAL AND TEXT-BOOK OF EMBRYOLOGY. By CHARLES W. PRENTISS, A.M., Ph.D., Professor of Microscopic Anatomy in the Northwestern University Medical School, Chicago. Large octavo of 400 pages, with 400 illustrations, many in colours. Cloth, 17s. net.

Recently Issued.

"*A lucid, comprehensive, and yet not too extensive text-book, which we cordially recommend.*"—THE LANCET.

Neurology

INTRODUCTION TO NEUROLOGY. By C. JUDSON HERRICK, Ph.D., Professor of Neurology in the University of Chicago. 12mo of 360 pages, illustrated. Cloth, 7s. 6d. net.

Recently Issued.

"*Should prove of much use as a work of reference.*"
—EDINBURGH MEDICAL JOURNAL.

Military Hygiene

MILITARY HYGIENE AND SANITATION. By Lieut.-Col. FRANK R. KEEFER, Professor of Military Hygiene at the United States Military Academy, West Point. 12mo of 305 pages, illustrated. Cloth, 6s. 6d. net.

Recently Issued.

"*An elementary introduction to the study of the subject. The subject is clearly treated.*"—THE LANCET.

Bacteriological Technique

THE ELEMENTS OF BACTERIOLOGICAL TECHNIQUE. By J. W. H. BYRE, M.D., Bacteriologist to Guy's Hospital, London. Octavo of 518 pages, illustrated. Cloth, 13s. net.

Second (Revised) Edition.

"*The book is stamped throughout with evidence that the writer is a practical teacher, and the directions are more clearly given than in any previous work.*"—THE LANCET.

W. B. SAUNDERS COMPANY, 9, Henrietta Street, London, W.C. 2.

LES ETABLISSEMENTS POULENC FRERES

92, RUE VIEILLE DU TEMPLE, PARIS.

First Class Award for Liquors and Liquid Extracts and Pharmaceutical Preparations International Medical Exhibition, London, '81.

Battley's Liquors

First Class Award at World's Industrial Exposition, New Orleans, 1885, Bronze Medal, St. Louis, 1904.

The following preparations have for many years been used and prescribed by medical men; they are therefore thoroughly recommended both on account of their high therapeutical properties and their great purity as galenical preparations.

Liquor Opii Sedativus (Battley)
Dose: 5 to 15 minims.
The Oldest and still the Best Hypnotic and Sedative.
Twice the strength of Tinctura Opii B.P.
Safe in use. No disagreeable after effects.
Composition always reliable.

Liquor Cinchonæ Cord. (Battley)
Dose: 2 to 15 minims.
The most reliable preparation of Cinchona Bark.
Contains all the active principles of Yellow Bark.
Will remain unaltered for a great length of time, being free from starch, etc.

Liquor Cinch. Pallidæ (Battley)
Dose: 2 to 15 minims.
A well-known and useful preparation in Malarial Diseases and in Convalescence after Illness.
Does not disturb the stomach.

Liquor Secalis Cornuti (Battley)
Dose: 20 to 60 minims.
Pre-eminent among Ergotic Preparations for Purity and Strength, and has proved to be unrivalled in the following therapeutical actions:—As an Emmenagogue and Ecbolic, in Post Partum Hæmorrhage, as a Hæmostatic, etc.

Battley's Liquors are issued in 2 oz., 4 oz., 8 oz. and 1 lb. bottles.
They are prepared according to the original process of the late Richard Battley.

HOMMEL'S HÆMATOGEN

A natural organic IRON TONIC associated with nourishing albuminous proteids.

Entirely Free from Antiseptics.

AN EFFICACIOUS REMEDY IN SEVERAL FORMS OF ANÆMIA, associated with constitutional diseases, and A POWERFUL RESTORATIVE when much blood has been lost, as from wounds sustained in action, by post-partum hæmorrhage, or in the course of surgical operations.

IMPROVES THE GENERAL NUTRITION IN TUBERCULOSIS.

PALATABLE, APPETISING, and free from any constipating tendency.

☛ **Please note that HOMMEL'S HÆMATOGEN is and always has been manufactured in SWITZERLAND BY SWISS PROPRIETORS, and that a continuous supply is assured. The price has not been increased.**

In prescribing please always specify HOMMEL'S Hæmatogen.

Samples Free and Carriage Paid on application to—

HOMMEL'S HÆMATOGEN, 36/36a, St. Andrew's Hill, Doctors' Commons, LONDON, E.C.

Emol-Keleet

The Natural Sedative Emollient Dusting Powder

After vaccination, dusting the vesicles with **Emol-Keleet** will be found to have a mildly astringent action and to considerably alleviate the local irritation. Owing to its purely inorganic composition and its extremely fine, impalpable texture, it may be recommended with advantage for regular application.

Emol-Keleet has a very beneficial effect in all cases of inflamed and irritated conditions of the skin. It is especially indicated in the treatment of epidermic irritation accompanying scarlet fever and measles, and its absorbent and sedative properties make it particularly beneficial in purulent eczema and inflammatory papulæ.

Samples Free to the Medical Profession on Request.

FASSETT & JOHNSON, LTD.

Municipal Supply of Milk

THE Health Departments of many large industrial centres have solved the problem of the supply of pure uncontaminated milk to Infants attending their weekly consultations by using Glaxo, the standardised germ-free Dried Milk.

In the Annual Report for 1916, lately issued, the Medical Officer of Health of an important industrial town says:—

"It is impossible to over-estimate the advantages which the Corporation 'Glaxo Depot' offers to the mothers of artificially fed babies. Fresh supplies of this excellent preparation can be obtained at a reasonable cost, and the slightly increased price, owing to the war, does not appear to affect its popularity."

Glaxo is packed in sealed packets and reaches the consumer free from fly-borne or other contamination.

For infants deprived of breast milk or where the milk supply is not above suspicion, Glaxo is of great service.

Further evidence of this statement is contained in the fact that for over eight years it has been continuously used by Municipal Health Departments all over the United Kingdom.

Amongst others, the following have purchased:—

SHEFFIELD Health Dept., over ...	200,000 lbs.
ROTHERHAM „ „ „ ...	90,000 lbs.
MANCHESTER School for Mothers	80,000 lbs.
BRADFORD Health Dept., over ...	70,000 lbs.
LINCOLN „ „ „ ...	50,000 lbs.
BIRMINGHAM „ „ „ ...	35,000 lbs.

Large quantities of Glaxo have been supplied to H.M. War Office for use in the Military Hospitals both at home and abroad, and the demand is constantly increasing.

Boots Pure Drug Company Limited.

Chloramine-T, while freely soluble in water, is practically insoluble in oils. But the corresponding dichloramine (toluene-p-sulphodichloramine, $CH_3.C_6H_4.SO_2NCl_2$, to which we now propose to assign the abbreviated name of dichloramine-T), though very sparingly soluble in paraffin oil, is quite readily dissolved in eucalyptol. The resulting solution can be subsequently diluted with paraffin. In this way a reasonably bland oil solution, containing as much as 2 per cent. of the dichloramine, can be obtained. It is with such solutions of different strengths that our second series of experiments was made.†

Keeping abreast with Medical Research

THE influence which medical research has on medical practice is more directly effective when accompanied by the immediate manufacture in marketable quantities of new compounds which are discovered. Of interest to the profession, no doubt, is the fact that Boots Pure Drug Co. Limited, are manufacturing synthetic and natural organic drugs of unsurpassed purity and excellence. They can supply immediately to the medical profession all the new antiseptics used by Dakin and his colleagues in their researches, which are described in various issues of the *B.M.J.* The attention of medical men is directed to

Oil solution of

Dichloramine-T

(toluene-p-sulphodichloramine)

FOR USE IN SURGERY AND NASAL ANTISEPSIS.

A complete outfit, containing the necessary drug, prepared oils, and atomiser, suitable for the treatment described and recommended by Dunham & Dakin in the *B.M.J.* of June 30th, 1917, page 865, for the disinfection of the naso-pharynges of carriers, is supplied by Boots Pure Drug Co. Limited. Supplies of Dichloramine-T are also available for prescription service on application through any of the 580 branches of Boots The Chemists.

Price of complete Outfit, 7/6 post free; or without Atomiser, 5/-

Special terms to the Medical Profession.

From Paterson's "The Surgery of the Stomach":

"After severe operations I always order an ounce of Sanatogen to be given during the course of the twenty-four hours. I regard this preparation as a valuable restorative in these cases."

From Whitla's "Pharmacy, Materia Medica & Therapeutics":

"Sanatogen is a well-known food consisting of casein in chemical combination with glycero-phosphoric acid. .....

"In neurasthenia and all forms of malnutrition and debility this food is clearly indicated. .....

"The interesting and valuable researches conducted by Tunnicliffe and by Beddoes upon metabolism, in which Sanatogen was experimented with, establish the fact that its organic phosphorus is almost entirely assimilated. ..... When given in addition to other food, the amount of nitrogen and phosphorus retained in the organism is increased; the tissue metabolism is more complete; appetite is increased and body weight augmented. ..... The administration of lime and soda phosphates produced no such results."

The above testimony—strikingly significant at the present time—applies only to the genuine original SANATOGEN, now entirely BRITISH OWNED and MADE.

SAMPLES FOR CLINICAL USE ON APPLICATION TO—

GENATOSAN, LTD. (British Purchasers of the Sanatogen Co.),

Chairman: Lady Mackworth,

12, CHENIES STREET, LONDON, W.C. 1.

NOTE.—*Sanatogen will later on be re-named "Genatosan"—Genuine Sanatogen—to distinguish it from so-called substitutes.*

Prescribed by the Medical Profession for 35 years.

The MEDICAL PRESS & CIRCULAR (London, Eng.) says:
"Few modern improvements in pharmacy have done so much as Benger's Preparations to assist the physician in his treatment of the sick."

"AN OUTSTANDING FOOD."

Everywhere Benger's is the Food relied upon by the British medical profession, in the prostration of illness, after severe operations, and in cases of difficult feeding.

Benger's is the One Food which contains the active enzymes of natural digestion (the amylolytic and tryptic ferments), and because of these, *it is the One Food* which is self-digestive to any extent the physician may prescribe.

It is a safe food to give in sickness and in severe digestive derangement, and is usually retained when all other foods are rejected.

BENGER'S FOOD (which is to be prepared with fresh new milk) is enjoyed by invalids who are unable to assimilate milk alone or milk and water.

BENGER'S
Food

for INFANTS, INVALIDS, AND THE AGED,

is sold throughout the World by Chemists, &c., in sealed tins, price 1/-, 1/6, 2/6, 5/-, and 10/-.

A physician's sample, with full particulars, will be sent post free on application to any member of the medical profession.

THE ORIGINAL
ADRENALIN

The hæmostatic and blood-pressure-raising principle of the suprarenal gland, as first isolated in 1900 by TAKAMINE, and placed on the market in January, 1901, by PARKE, DAVIS & Co.

At the request of the General Medical Council, Parke, Davis & Co. gave permission for the use of the word 'Adrenalin' in the 1914 British Pharmacopœia. Medical men will naturally prefer to use the original and well-tried P., D. & Co. preparation, and to ensure that this will be supplied, prescriptions and orders should distinctly specify "P., D. & Co."

PREPARATIONS FOR USE IN MEDICINE:

Employed with success in the following as well as numberless other conditions:

Asthma.	**Coryza.**	**Hæmatemesis.**	**Otitis Media.**
Cardiac Failure.	**Dysentery.**	**Hæmorrhoids.**	**Pruritus.**
Cholera.	**Enteric Hæmorrhage.**	**Hay Fever.**	**Purpura.**
Conjunctivitis.	**Epistaxis.**	**Œdema.**	**Varicocele.**

ADRENALIN CHLORIDE SOLUTION, 1 in 1,000 (P., D. & Co.).
Of great value in many forms of hæmorrhage, hyperæmia and congestion of mucous membrane, also as a prompt cardiac stimulant in shock, collapse or acute disease.

ADRENALIN CHLORIDE SOLUTION, 1 in 10,000 (P., D. & Co.).
Supplied in ampoules of 1 c.c., a convenient quantity for hypodermic or oral (also, if further diluted with saline solution, for intravenous) administration in asthmatic seizures, shock, collapse, etc.

ADRENALIN TABLETS (P., D. & Co.).
Supplied in two strengths, for dissolving in 5 or 17 minims, respectively, of sterile water, to form 1 in 1,000 solution.

ADRENALIN GAUZE TAPE (P., D. & Co.).
Soft gauze impregnated with 1 in 2,000 solution of Adrenalin Chloride for use as a hæmostatic dressing, swab or tampon.

ADRENALIN INHALANT (P., D. & Co.).
1 part of Adrenalin Chloride and 30 parts of Chloretone in 1000 parts of an aromatised neutral oil. Constringent and sedative. For use as a nebula in inflammations of the nose, throat and bronchi.

ADRENALIN THROAT LOZENGES (P., D. & Co.).
Contain Adrenalin, diamorphine, ipecacuanha, and red gum. Agreeably flavoured. Astringent, sedative and expectorant.

ADRENALIN OINTMENT (P., D. & Co.).

ADRENALIN AND CHLORETONE OINTMENT (P., D. & Co.).
Each of these ointments contains 1 per mille of Adrenalin Chloride, and is useful in inflammatory conditions of mucous membrane. The ointment containing Chloretone (5 per cent.) provides a soothing as well as constringent action.

ADRENALIN SUPPOSITORIES (P., D. & Co.).
Contain 1 per mille of Adrenalin. Constringent. Hæmostatic.

ADRENALIN AND CHLORETONE SUPPOSITORIES (P., D. & Co.).
Contain 1 per mille of Adrenalin and 20 per cent. of Chloretone. Constringent and sedative.

ADRENALIN COMPOUND SUPPOSITORIES (P., D. & Co.).
Contain Adrenalin, cocaine, formidine and extract of hamamelis. Constringent, analgesic and antiseptic.

PREPARATIONS FOR USE IN LOCAL ANÆSTHESIA:

The ischæmic action of Adrenalin retards diffusion of cocaine or eucaine, thereby intensifying their analgesic effect; it also greatly lessens operative bleeding.

ADRENALIN AND COCAINE HYPODERMIC TABLETS (P., D. & Co.).
Supplied in three strengths.

'EUDRENINE' (P., D. & Co.).
A 1% solution of benzamine (eucaine) hydrochloride with Adrenalin Chloride (1 in 30,000).

'CODRENINE' (P., D. & Co.).
A 2% solution of cocaine hydrochloride with Adrenalin Chloride (1 in 15,000).

'LOCOSTHETIC' (P., D. & Co.).
A solution containing 0·75% of cocaine hydrochloride with Adrenalin Chloride (either 1 per 50,000 or 1 per 100,000, as preferred.

The "Allenburys" (Trade Mark) and its Cod-Liver Oil Preparations.

"It is as nearly tasteless as Cod-Liver Oil can be."—LANCET.

The "Allenburys" Cod-Liver Oil is obtained from the finest selected livers of fresh cod, and prepared at Allen & Hanburys' own factories at Lofoten and Söndmör, in Norway. It is the result of manufacturing experience of nearly half a century, and represents the highest technical skill. The process of manufacture ensures the elimination of all unpleasant and harmful products. The "Allenburys" Cod-Liver Oil is therefore perfectly pure, and by its merit alone has obtained a unique position in the estimation of the profession. It is retained and assimilated when other Cod-Liver Oils derange the digestive system, and its full nutritive power is thereby assured.

"Bynol" (Trade Mark)

"A perfect combination of Malt Extract and Cod-Liver Oil."—B.M.J.

"Bynol," the "Allenburys" Malt and Oil, presents the pure "Allenburys" Cod-Liver Oil in intimate association with the finest Malt Extract. It contains a very high percentage of Cod-Liver Oil and is a valuable nutrient and digestive. Palatable and acceptable to the most fastidious, it is readily assimilated even when the digestive organs are impaired.

"Bynin" Emulsion (Trade Mark)

"This preparation is doubtless a valuable one, and one which we are glad to bring before the notice of the profession."—LANCET.

"Bynin" Emulsion is a unique combination of the "Allenburys" Cod-Liver Oil with "Bynin" pure active liquid malt, together with the hypophosphites of lime and soda. Palatable and easily digested, it is a valuable restorative of high nutritive power. It invigorates the nervous system and nourishes the enfeebled tissues.

The 'Allenburys' Foods

Special Advantages

1—The close conformity in composition of the Milk Foods to human milk; both fat and proteids being in similar relative proportions.

2—The readiness with which the Foods are assimilated; being as easy of digestion as maternal milk.

3—Their adaptability as an adjuvant to breast feeding during the period of weaning; no digestive troubles being likely to occur.

4—Their freedom from all harmful bacteria; being made from fresh milk, modified, evaporated at a low temperature, in vacuo, and preserved in hermetically sealed tins.

5—The ease and exactness with which the Foods can be prepared; the addition of hot water only being necessary.

6—Fresh elements of diet can be easily added to the Foods, and are specifically mentioned on each tin.

A reliable substitute is thus provided for the Mother's Milk, when this is wanting or deficient.

Milk Food No. 1 From birth to 3 months.

Milk Food No. 2 From 3 to 6 months.

Malted Food No. 3 From 6 months upwards

The "Allenburys" Rusks (Malted)
A valuable addition to baby's dietary when 10 months old and after.

A descriptive Pamphlet, giving Analyses, etc., and Samples of the Foods will be sent on request.

Physicians should specify

'Tabloid' BRAND

TRADE MARK

ASPIRIN

because

Figure of a Javanese warrior. He wears three krises at the waist, one on each side and the other behind. One is the kris which has descended to him from his ancestors and another he has received on marriage from his wife's father. A sword is also worn at the left since the seventeenth century. In combat the spear and kris were used alternately. The kris is the weapon used in the state of frenzy known as "running amok." Accounts of Javan battles are full of instances of warriors abandoning all idea of self-preservation and rushing madly upon the enemy, their fury often increased by the use of opium or Indian hemp. Date: Middle Ages to modern times.

¶ 'TABLOID' ASPIRIN is prepared from acetylsalicylic acid of the highest possible purity, free from salicylic and acetic acids and having the correct melting-point.

¶ 'TABLOID' ASPIRIN contains the stated weight of pure medicament and is absolutely free from talc and boric acid.

"MALTINE"

"MALTINE" contains 75 per cent. of diffusible Cereal Proteids, Carbohydrates and Organic Phosphates. It is pure, concentrated, standardised in diastase (1000), of convenient semi-liquid consistence, and very palatable.

Professor CHITTENDEN (Yale University) reports:—

"The results demonstrate conclusively the far greater diastasic value of your preparation, and enable me to state, without any qualification whatever, that 'MALTINE' far exceeds in diastasic power any of the preparations of malt which I have examined."

"Maltine" with Hypophosphites.

FORMULA: Each fluid ounce contains—

3	grains	Hypophosphite of	Lime.
3	"	"	Soda.
2	"	"	Iron.

Dose.—A dessertspoonful to a tablespoonful three times a day directly after meals. Children in proportion.

In this product the valueless and inert cane sugar syrup of the B.P. preparation is replaced by the highly nutritive and diastasic "MALTINE." The reconstructive effects of the chemical hypophosphites are thus notably reinforced by the vitalised organic cereal phosphates of the "MALTINE," while *pari passu* digestion is powerfully aided.

Indications.—Wherever the plain syrup is indicated "MALTINE" $\bar{c}$ HYPOPHOSPHITES may be substituted with great success.

The word "MALTINE" is our Trade Mark.

In prescribing kindly specify "MALTINE COMPANY."

THE MALTINE MANUFACTURING CO., Ltd., 183, Acton Vale, London, W. 3,
Will be pleased to send Samples Free of Charge to Medical Men.

CARNRICK'S "LIQUID PEPTONOIDS."

Beef, Milk, and Wheat (Pre-digested).

"LIQUID PEPTONOIDS" is a sustaining, reconstructive, mildly stimulating fluid nutrient, ready for immediate absorption and assimilation. It is aseptic, eminently palatable, free from extractive material, completely pre-digested, and sufficiently concentrated to nourish a patient for a considerable time during critical stages of severe illness when other forms of food are refused.

SAMPLES FREE TO MEDICAL MEN.

CARNRICK & CO., Limited, 183, Acton Vale, London, W. 3.

A Report
ON
THE PATHOLOGY, DIAGNOSIS, AND TREATMENT OF ABSOLUTE HYSTERICAL DEAFNESS IN SOLDIERS.

BY A. F. HURST, M.D. OXON., F.R.C.P.LOND.,
PHYSICIAN AND NEUROLOGIST TO GUY'S HOSPITAL, AND NEUROLOGIST TO R.V.H., NETLEY; TEMPORARY MAJOR, R.A.M.C.;
AND
E. A. PETERS, M.D. CAMB., F.R.C.S. ENG.,
SURGEON, ROYAL EAR HOSPITAL, AND AURAL SURGEON TO R.V.H., NETLEY; TEMPORARY CAPTAIN, R.A.M.C.

TWO CASES OF HYSTERICAL DEAFNESS CURED BY "OPERATION."

THE following case of hysterical deafness following shell shock was cured by "operation."

Lance-Corporal M., 26 years old, was blown up by a shell on August 29th, 1916. He became completely blind, deaf, and dumb, although he did not lose consciousness. His sight returned the following day. On reaching England he was able to read and write, and he talked in his sleep. In spite of treatment with encouragement, electricity, and etherisation, no further improvement occurred until one night in November, when he woke up and asked the sister for a drink. After this he was able to talk normally, but the deafness remained.

The patient was transferred to the Neurological Section at Netley on March 21st, 1917, seven months after the onset of deafness. He was found to be completely deaf both to air and bone conduction, though he could feel the vibration of a tuning-fork on his mastoid. A loud noise just behind his head caused a slight tremor of his hands, blinking and dilatation of the pupils, although he heard nothing; a slighter reaction was produced on the second and third occasion when the noise was repeated; after this it disappeared completely and did not return again.

The functional activity of the vestibular nerve and semicircular canals was then tested: the normal nystagmus and giddiness demonstrated that this system was unaffected. As our experience shows that organic disease or injury of sufficient intensity to produce severe cochlear deafness is invariably accompanied by loss of vestibular activity, we were assured that the internal ear was free from organic changes. This was rendered still more probable by the fact that immediately after the explosion the deafness was associated with mutism, which is always hysterical when it develops after shell shock. The patient was hypnotised by being made to stare at a lens for 15 seconds, but the deafness persisted; he could not be made to respond to any suggestion, as he was unable to hear; and a very loud noise produced no auditory motor reflex, the pupils as well as the eyelids remaining fixed.

The deafness also persisted during natural sleep, as it was found impossible to wake the patient by shouting "fire," and by banging a poker against a coal-scuttle within a few inches of his head, and no reflex contraction of his eyelids was observed. In the morning he had no recollection that anything unusual had occurred during the night. Suggestion with the aid of electricity, in which he had great belief, and attempts to re-educate the sense of hearing with various noises completely failed.

On April 16th he was told that if, in spite of the treatment he had had before and since admission, his hearing had not returned by the 20th we should have to do a small operation on his ear, which would be certain to cure him. As his hearing had not improved on the 20th he readily consented to the operation. Two small superficial incisions were made behind his ear under light etherisation and a suture was inserted. A loud noise was made during the "operation"; he heard it and jumped off the table. In the course of the next few minutes normal hearing returned in both ears to his intense delight, as he had recently become extremely depressed at the absence of any sign of improvement after seven and a half months. His hearing was accurately tested the next day, and it was found that it was perfectly normal both to air and bone conduction and the auditory motor reflexes had returned. He was discharged to duty three weeks later feeling perfectly fit. He visited the hospital on June 29th, a few days before he left for France. His hearing was normal and he was well in every way.

Another case of hysterical deafness following gun deafness was also cured by "operation."

Gunner F., aged 18, says he has been slightly deaf all his life. He became gradually deafer after gun practice whilst training in England until he could not hear at all, although he had never suffered from any definite concussion and had not served abroad. He was totally deaf to air and bone conduction, and it was impossible to wake him by the loudest noises when he was asleep. The deafness also persisted during deep hypnosis, so that he could not be made to respond to suggestion. The normal nystagmus and giddiness followed rotation, and he had a brisk auditory motor reflex both when awake and during sleep, but it was clear that this was not associated with hearing.

Ordinary persuasion, suggestion, and hypnotism having failed to produce any improvement after five months, he was advised to undergo an operation, which he was told would certainly cure him. He was given a little ether, and an incision was made behind his right ear, a plate of iron being continuously hammered at the same time. He jumped from the table in a half-drunken condition, hearing quite well, and said he must have had a dream, as he thought he had been deaf. The next day he said that he could hear better than he had ever done before. He was discharged to duty 10 days later. Two months later a report was received that his hearing remained good, he was doing his work well, and had applied for a commission.

Examination of his ears a week after the operation showed that he could only hear a 30-inch watch at 20 inches; the upper and lower limits of hearing were normal. Both drums were indrawn and showed evidence of chronic catarrh, which was doubtless the cause of his long-standing deafness. He was thus predisposed by chronic ear disease to gun-deafness, and the temporary deafness produced during gun practice was perpetuated and exaggerated by auto-suggestion. The true gun-deafness had disappeared spontaneously, so that when the total deafness resulting from suggestion was cured by suggestion in the form of an operation, his hearing returned to its original state.

ETIOLOGY.

The momentary deafness which is the natural result of the terrific noise caused by the explosion of a big shell in the immediate neighbourhood may make such an impression on the mind of a soldier that on coming to himself, whether he has actually lost consciousness or not, his first thought is for his hearing, especially if it was already impaired by preceding disease, and he may be so convinced that he is permanently deafened that he becomes actually deaf as a result of auto-suggestion.

The temporary deafness which occurs in gunners from the effect of the constant repetition of very loud noises may in the same way become perpetuated and exaggerated by auto-suggestion.

Lastly, organic deafness, especially if the onset is acute, as in that due to involvement of the auditory nerve trunk in cerebro-spinal fever, may remain complete after the disappearance of the active inflammation has been followed by restoration of some of the nerve fibres, so that a certain amount of hearing should have returned. This, again, is due to auto-suggestion, the final deafness being organic with a superadded hysterical element, which is capable of removal, like all hysterical symptoms, by suggestion.

DIAGNOSIS.

We have found it necessary to discard almost all the criteria formerly used in the diagnosis of organic deafness from deafness due to hysteria or malingering.

1. *History.*—Severe deafness following the explosion of a powerful shell is generally hysterical, though a lesser degree of organic deafness of a more or less permanent nature may be produced at the same time owing to rupture of the drum or hæmorrhage into the tympanum, which are often followed by infection of the middle ear, or to interference with the cochlear and vestibular systems probably due to infiltration-œdema or hæmorrhage into the labyrinth. It is doubtful whether absolute organic deafness ever results from hæmorrhage into the internal ear following shell shock, as no anatomical evidence of such an occurrence has yet been forthcoming. Deafness following an acute illness, especially cerebro-spinal fever, is, at any rate, always organic, but the deafness is in our experience frequently increased as a result of auto-suggestion, no functional improvement occurring when the anatomical condition improves.

2. *Bone and air conduction.*—We have employed the following quantitative tests.

(*a*) Watch test for air conduction. The distance a watch is heard (x) is expressed as a fraction of the distance at which it is heard by the normal ear (y): $\frac{x}{y}$.

(*b*) Modified Schwabach test for bone conduction. The base of a vibrating C tuning-fork is held to the base of the mastoid whilst the other hand curtains the meatus. The patient holds up his finger when the sound is no longer heard; the observer then transfers the tuning-fork to his own normal mastoid and notes the number of additional seconds during which he hears the fork.

These tests and comparison between bone and air conduction, as in Rinne's test, are, however, only of value in the slighter cases, as in many instances deafness is absolute and no hearing is possible whether the sound is conducted by bone or through the air. The vibration of a tuning-fork held on the mastoid process is often felt and the aerial vibration caused by very loud noises is often appreciated, even when no sound is heard.

3. *Auditory motor or jump reflex.*—A sudden noise normally causes an individual to jump and often to blink and the pupils dilate; the "jump," at any rate, is a protective reflex and represents the preparation for flight or fight. An officer whose left motor cortex had been almost completely destroyed went to *The Man who Stayed at Home* about four months after he was wounded. His right arm jumped violently when the gun-shot rang out on the stage, although no trace of voluntary movement returned until three months later. The efferent part of the reflex is thus subcortical.

In certain war neuroses of emotional origin in which the reflex is exaggerated jumping continues during sleep and deep hypnosis, although the patient does not hear the noise which induces it, even in a dream. The afferent part of the reflex is thus subcortical. That the reflex is quite independent of actual hearing is further shown by the fact that during deep hypnosis with the eyes open individuals in whom the reflex is normal or only slightly exaggerated do not always jump or blink, and the pupils do not dilate even when a poker is banged against a shovel within a foot of the ear, although they answer even whispered questions and obey whispered commands, and the cutaneous and tendon reflexes remain unaffected. Experiments on animals by Sherrington confirm these clinical observations and indicate that the auditory motor reflex is a function of the mid-brain.

A slight reflex was present in most of our cases of hysterical deafness, but it became less marked and sometimes disappeared completely or was confined to a slight dilatation of the pupil when the test was repeated. A very nervous but totally deaf mute remained completely unmoved, never jumping or showing a flicker of his eyelid during one of the severest thunderstorms we have known, and yet the next day he was completely cured by suggestion.

It is thus clear that the presence of the auditory motor reflex does not imply that hearing occurs, and a man who says he can hear nothing but shows a normal reflex is not necessarily a malingerer, but may be suffering from genuine hysterical deafness or even organic deafness due to a bilateral lesion of the cortical auditory centres.

4. *Persistence during sleep.*—As hysterical symptoms are due to suggestion, it might be expected that they would not persist during sleep, and Babinski regards this as a definite law. Our experience agrees with his with regard to all other hysterical symptoms which we have investigated, such as paralysis, contractures, and anæsthesia, and we have seen several deaf-mutes who talked in their sleep, but we have found that hysterical deafness, the behaviour of which during sleep does not appear to have been tested by Babinski, is an exception. Thus, greatly to our surprise, we found it quite impossible to wake either of our two patients, who were suffering from total hysterical deafness, by shouting or by making other very loud noises within a foot of their heads. We convinced ourselves that deception was impossible, and the hysterical nature of the deafness in both cases was at a later date conclusively proved by their instantaneous recovery with powerful suggestion. In one patient a slight twitch of the eyelids was sometimes observed with a particularly loud noise, but not in the other. It seems probable that a malingerer could be detected by this test, as he would certainly wake if a loud noise was made when he was asleep, whereas in hysterical and organic deafness waking does not follow.

5. *Effect of hypnosis.*—We had expected that hearing would return in hysterical cases during hypnosis, but we found it quite impossible to make the patients obey any command or show any signs of hearing, and no reflex was produced, although both were deeply hypnotised on several occasions. The synapses thus appear to remain unswitched during hypnosis as they do during sleep.

6. *Change in the voice.*—It is difficult to understand why there should be any difference in the effect on the voice of total organic deafness and total hysterical deafness, as the change is simply a result of the patient's inability to hear his own voice. It is, however, a fact that we could not observe anything abnormal about the speech in any of our hysterical cases.

7. *Vestibular reaction.*—We have found that the only test upon which absolute reliance can be placed in the diagnosis of hysterical deafness from organic deafness is the presence of normal vestibular reactions in the former and their loss in the latter. The vestibular reactions are entirely beyond the control of the will, and it is therefore inconceivable that they should disappear as a result of suggestion. As hysterical symptoms are always caused by suggestion, the vestibular reactions must remain unaffected in hysterical deafness. This test has proved of great value in cases of total deafness. But it must be remembered that in partial organic deafness the vestibular reactions are lost in the severer cases and exaggerated in the slighter cases, and the organic deafness may be accompanied and exaggerated by the simultaneous presence of hysterical deafness, which it is quite impossible to recognise except by the improvement which follows treatment by suggestion. The vestibular reactions may be investigated by the rotation, caloric, or electric tests, in all of which nystagmus and giddiness occur in normal individuals, but not if the vestibular nerves are involved. We have employed the rotation test for our cases, the patient being tied into an arm-chair, which is rotated ten times in 10 seconds.

PATHOGENESIS.

Hearing necessitates listening. Inattention during a dull sermon results in total deafness to the sermon, and in hysterical deafness the patient is so convinced that he cannot hear that he does not listen. Although the sound vibrations reach the ear in the normal way, they do not give rise to the slightest auditory sensation because of this inattention. The synapses at one or more of the cell stations in the auditory path to the cerebral cortex must, therefore, be unswitched, probably as a result of retraction of the dendrons. In absolute hysterical deafness the auditory motor reflex, which is a function of the mid-brain, may be abolished or greatly diminished. One of the unswitched synapses must, therefore, be below the mid-brain and either in the auditory nucleus or less probably in one of the intermediate cell stations—the superior olive or the nucleus of the lateral fillet.

The persistence of the deafness during hypnosis and natural sleep shows that during the prolonged inattention of hysterical deafness which has lasted for a considerable period the unswitching of the synapses is more profound than that which normally occurs during deep sleep, in which the synapses can always be forced by a loud noise.

TREATMENT.

Deaf-mutism.

Uncomplicated deafness is the most difficult of all hysterical symptoms to treat; mutism is one of the easiest. It is therefore fortunate that most cases of hysterical deafness are associated with mutism, as the return of speech in a deaf-mute generally convinces him that he can also hear, especially if he has been told that this will be the case. He listens as soon as he finds he can speak, and the unswitched synapses are once more switched on.

Among the numerous cases of deaf-mutism observed by one of us (A. F. H.) rapid recovery always occurred, sometimes spontaneously as a result of various accidental circumstances and sometimes as a result of various methods of treatment. One man was sleeping when his parents came to visit him a fortnight after he had become dumb as a result of shell-shock. They woke him up, and he at once said, "Hullo,

mother." Another recovered after a cold douche as he was getting out of a hot bath. The majority of deaf-mutes who required treatment were cured by the introduction of an intralaryngeal electrode, generally before the current was switched on, after having been told that this would cure them at once. With the aid of vigorous persuasion this method of suggestion is nearly always effective. At least one man has recovered when drunk and numerous others under anæsthesia. Sufficient ether should be given to make the patient excited, and vigorous suggestion and persuasion must then be used until the patient has completely regained consciousness.

Uncomplicated Deafness.

We have only seen two cases of absolute hysterical deafness without mutism, and in one of them mutism was originally present, but spontaneous recovery had occurred some months earlier. Both cases had had various forms of treatment before we saw them. Simple encouragement and the promise of recovery had proved unavailing, and when we repeated the promise to a man who was still completely deaf after eight months, he not unnaturally received our promise with considerable scepticism. We tried the effect of making very loud noises of different kinds near the patients' ears in the hope that they might break through the resistance, and that when they were heard, re-education with other sounds could be begun. But this method, which is sometimes successful in the partially deaf, was unavailing, as the deafness was absolute, and no noise, however loud, was heard. On many occasions the patients themselves shouted as loudly as they could through the chest-piece of a binaural stethoscope, the ear-piece of which was in their own ears, and at other times the chest-piece was put on an iron plate, which was then hammered, but they heard nothing. Etherisation had been tried without success before we saw them. Various forms of suggestion were tried; one patient had a great belief in electricity, but although we encouraged him to believe it would cure him, it had no effect. Both patients were hypnotised on a number of occasions without difficulty, but this proved useless, as the deafness persisted, and they could not be made to obey any commands which other hypnotised individuals obey immediately, so that suggestions of recovery which are effective in patients suffering from incomplete hysterical deafness naturally gave no result; other loud noises and familiar tunes from a gramophone placed in contact with the ear during hypnosis had no more effect than shouting, and as the deafness persisted during sleep it was impossible to cure the patients by suddenly exciting them during the night.

As all treatment had failed, we told the more intelligent of the two patients that if he did not get well in the next week we would be compelled to advise him to undergo an operation, which we had wished to avoid, but which was quite certain to cure him. He was no better at the end of the week, and was eager to have the operation. He was given enough ether to make him excited, and two small cuts were then made behind his ear; a hammer was banged on a sheet of iron during the "operation," and the moment after the incision had been made the patient jumped off the table with his hearing restored. The other patient was unwilling at first to undergo an operation, but finally consented, as he was naturally impressed by the recovery of the first patient, who was in the same ward and had been deaf for a much longer period. The same "operation" was performed and complete recovery occurred in exactly the same way. The joy shown by both patients on their recovery whilst in the theatre, and on return to the ward was so obviously genuine that there could be no possible question about the genuineness of the deafness; at one time we had been rather doubtful about the second patient, but fuller investigation had convinced us more than a fortnight before that he was not malingering.

CONCLUSIONS.

We are convinced from our experience in these cases that absolute deafness associated with normal vestibular reactions should be regarded as hysterical, and when simple encouragement fails, as will generally be the case if the patient is not also dumb, an "operation" should be performed in the way we have described, after the patient has been made to feel quite confident that it will restore his hearing.

A Comparative Study

OF

THE REACTIONS TO HUMAN AND BOVINE TUBERCULIN APPLIED BY THE METHOD OF VON PIRQUET

IN CASES OF TUBERCULOUS DISEASE OF THE BONES AND JOINTS.[1]

BY H. J. GAUVAIN, M.A., B.C. CAMB., M.R.C.S., L.R.C.P. LOND.,

MEDICAL SUPERINTENDENT OF THE LORD MAYOR TRELOAR CRIPPLES' HOSPITAL, ALTON, HAMPSHIRE.

THE work here reported was done for the Local Government Board concurrently with their investigation into the types of tubercle bacilli occurring in tuberculous bones or joints.[2]

In aid of the latter inquiry I sent for examination in the Board's Pathological Laboratory material from abscesses or sinuses occurring in 116 children[3] who were affected with tuberculous bone or joint disease and were patients in the Lord Mayor Treloar Cripples' Hospital at Alton. In discussions which I had with the Board's pathologists, Dr. A. Eastwood and Dr. F. Griffith, it occurred to us that, having these cases under observation, it would be a matter of interest and some practical importance to undertake a quantitative investigation of the von Pirquet cutaneous test on such of these patients as were available, to check the reactions by colour photographs and to endeavour to ascertain:—

1. Whether the reaction to cutaneous inoculations of tuberculin was constantly present in patients suffering from undoubted tuberculous lesions of the bones or joints—that is, in patients from whose lesions the tubercle bacilli had been isolated.
2. If not constantly present, under what circumstances the reaction would not appear.
3. Whether by using both human and bovine tuberculin for the von Pirquet test it would be possible to ascertain, from the reaction which followed, whether the patient was suffering from tuberculosis of human or bovine origin.
4. Whether the degree of reaction gave any indication of the severity of infection.
5. The extent and nature of the reaction.

These suggestions were submitted to the Board and received their approval. Accordingly, with the aid of a grant from them, I carried out the proposed work during the autumn of 1914, with the assistance of Mrs. Gauvain, who took colour photographs of the reactions obtained.

I applied the von Pirquet test to 80 out of the above 116 cases. In order to avoid any risk of unconscious bias I made the inoculations and recorded their results without knowledge of bacteriological reports as to the type of bacillus found.

The tuberculins employed were Koch's "old tuberculin," prepared from the "human" type of bacilli, and his tuberculin prepared in identical way from bacilli of bovine origin. These were supplied by Messrs. Meister, Lucius, and Bruning, of 3, Jewry-street, E.C., who certified as to their purity and efficiency.

Technique of Operation and Precautions Employed.

The tuberculins were applied to suitable skin scarifications in dilutions of 1/64, 1/16, 1/4, and in full strength, each in approximately equal bulk and controlled by inoculation of a scarification with the same quantity of sterile normal saline solution.

In the majority of cases the scarifications were made on the anterior surfaces of both thighs; where the legs were not available both arms were used. In every case a minimum distance of at least two inches existed between

[1] With the aid of a grant from the Local Government Board.

[2] A. Eastwood and F. Griffith: "The Characteristics of Tubercle Bacilli in Human Bone and Joint Tuberculosis," Journal of Hygiene, vol. xii., No. 2, Jan. 14th, 1916.

[3] In 11 of these cases tubercle bacilli were not obtained in culture; of the rest, 70 yielded bacilli of "human type," 32 "bovine" bacilli, and 3 atypical strains of tubercle bacilli.

any one scarification and its nearest fellow, so that adjacent reactions should not become confluent.

To minimise the possibility of tuberculin applied to one scarification being conveyed by the lymphatic channels to a neighbouring scarification which had been treated with a weaker solution of tuberculin the solutions, commencing with the control, were applied to the scarifications in order of increasing strength from the distal to the proximal extremity of each limb.

Human tuberculin was always applied to scarifications on the right side of the body and bovine tuberculin to scarifications on the left side.

To ensure the scarifications being as nearly as possible equal, the same von Pirquet scarifier, supplied by Messrs. Allen and Hanburys, was in every case used. This instrument may be quickly and conveniently sterilised by passing through the flame.

The control solution and the tuberculins were all applied to the scarification marks with sterile glass eye-rods of the same size, a separate rod being kept in each bottle. In this way approximately the same quantity of liquid was applied to the centre of each scar. The solution was simply placed on the scar, not rubbed in.

The bottles containing the solutions of tuberculin were all placed on one tray in ascending order of strength. On the right-hand side of the tray was the human tuberculin, on the left the bovine. In the middle was the bottle containing the control solution. The bottles had distinguishing coloured labels as a further safeguard against the possibility of introducing the wrong solution into the various scarifications.

The test was conducted as follows:—

The scarifier was first sterilised in the flame and the skin over the area on both limbs to be scarified cleansed with ether. The tip of the scarifier was then placed on the skin, the instrument being held vertically, and the scarification was performed by the exercise of firm but gentle pressure while rotating the scarifier between the finger and thumb about half-a-dozen times. The outer layer of the skin over a minute circular area was thus removed and the vascular subcuticular layer brought to view. It was found quite unnecessary to continue the pressure long enough to cause any bleeding.

The five scarifications were thus rapidly made on each of the two selected limbs at approximately the same level on both sides and in the same situation. The control saline was then applied to each of the most distal scarifications, the human tuberculin in increasing strength to the succeeding scarifications up the right side, the bovine similarly up the left. The limbs were kept uncovered until the liquid applied had dried. No dressing was employed, and the limbs, when dry, were simply covered with bedclothes in the ordinary way.

Local Reactions.

In no case did either variety of tuberculin fail to react. The degree and extent of the reaction varied within wide limits, and its persistence was also variable; but the response of every case to both tuberculins was particularly noteworthy. In the majority of cases reaction was clearly visible within 24 hours, and often could be observed within 12 hours. It usually reached its maximum at between 36 and 48 hours, and then gradually faded. Frequently the reaction of the quarter and full strength tuberculins remained well marked for a week or longer. In exceptional cases the reaction persisted for a month or more, and in one case (E. M., No. 89) who was inoculated on Nov. 26th, 1914, the reaction was still clearly visible on March 11th, 1915.

In each case the controls were negative. After two or three days the scars which had received the control solution became invisible, except on close search.

At this period, even when no definite reaction could be distinguished in the scarifications treated with the lower two dilutions of the tuberculin, the scars made would usually persist. Sometimes, though no colour change round these scars could be seen, passage of the finger over the scars gave the sensation of a small but definite papule depressed in the centre.

In patients not the subject of tuberculous disease this retardation of healing of the scar, to which diluted tuberculin had been applied, did not appear to exist. This observation was only made on a few subjects, as suitable non-tuberculous subjects of the age of the patients tested were not readily available. If, however, this observation stands the test of further investigation it would afford the suggestion that delayed healing in a scar to which diluted tuberculin had been applied, even in the absence of colour change and without palpable raising of the edge of the scar, is in itself evidence of a minimum degree of a positive reaction to the von Pirquet test.

Next in order of intensity were the reactions where there appeared a circumferential reddening of the skin about the crateriform depression made by the scarifier; this reddening varied from the merest line in some cases to a total circumference of about an inch or more in others. The outer edge of this area was quite distinct and the colour was of almost equal intensity, though perhaps not quite so marked at the periphery. The shape was sometimes irregular, but more usually circular or somewhat oval.

In reactions of greater severity than the last an outer halo of faintly red discolouration was distinctly visible, much less intense than the inner red area and of varying size, though rarely extending for more than a quarter of an inch from the central denser area, except where it tapered out into a filamentous projection or projections which marked the radiation of a lymphatic channel.

Finally, when the reaction was most intense the marked red area immediately about the scar became paler and more livid adjacent to the crater and sometimes assumed a purplish hue. This appearance marked the maximum reaction noted. It was characterised by four distinct zones—a depressed scar in the centre, bordering this a livid pink or purplish zone, surrounding the latter a well-marked zone of intense redness, and, embracing the last, a faintly pinkish area, the outer limit of which was indefinite and merged into the surrounding skin, being sometimes prolonged for a shorter or longer distance into radiating lymphatics.

As was to be expected, the degree of reaction generally varied with the strength of solution of tuberculin, stronger solutions provoking a more intense reaction than weaker. In some cases, however, particularly when inoculations were made on the thighs, the difference between reactions of a quarter and full strength were not marked, and occasionally the quarter strength solution appeared to cause a more intense reaction than the full strength. This may possibly be partly accounted for by accidental inequality in the degree of scarification. It was found that on approaching the groin the skin was less tense and rested on a less firm foundation than on the middle region of the thigh. With equal pressure the scar made by the scarifier in the groin region did not penetrate so deeply in the looser skin as the scar made on the firmer skin in the middle of the thigh.

Hence it is conceivably possible that a weaker solution of tuberculin inoculated into the skin of the middle of the thigh might cause a greater reaction than a stronger solution inoculated into the skin of the groin.

General Reaction.

To ascertain if any general reaction followed the employment of this test the temperature in each of the cases investigated was taken every two hours for the first 48 hours and every four hours for the succeeding 48 hours; subsequently the usual morning and evening temperatures were alone taken, unless for any reason it was found desirable to take the temperature more frequently. Subjective symptoms were also very carefully noted.

In the great majority of cases, except for a fractional rise of temperature, there was no evidence of any general reaction whatever. Often not even a slight rise of temperature was observed.[4]

In six cases only did the temperature rise up to or above 100° F. where the raised temperature could be ascribed to the test. This rise was always on the day succeeding the inoculation. In three of these cases the patients complained of headache and general malaise. These symptoms always rapidly disappeared, and in only one case did the headache persist throughout the day following the inoculation.

General reaction, when present, was only noticeable on the day succeeding the application of the test.

In one (R. T., No. 74) of these six the temperature rose to 100° F. on the afternoon succeeding the day of inoculation, and the patient complained of slight headache.

In another case (N. R., No. 80) the temperature rose to 101·4° F. on the afternoon following the day of inoculation. Patient looked flushed, complained of headache, and vomited undigested food once.

In the case where the general reaction was most marked (M. B., No. 9) the test was applied at 7 P.M. on August 26th,

[4] Care was taken, where possible, to test only apyrexial patients. In very few cases was there any pyrexia due to complicating sepsis or other cause.

1914. The next morning the patient looked ill, the eyes were sunken, face drawn and flushed, and the child was very quiet. There was slight erythema on the chest, abdomen, and back; the temperature was 100·5° F., and the patient complained of feeling ill and having headache. At 3 P.M. the temperature was 103·4°, cheeks more flushed, headache intense, and patient drowsy. In the evening the temperature went down, the headache was relieved, and the rash disappeared. The patient slept well at night, and the next morning he was bright, lively, with no headache and no discomfort; his temperature was normal and he appeared quite well.

In this patient the local reaction was more intense than in any of the others in the whole series. He was a fair-skinned, red-haired boy. It is probable that these symptoms were not the result of the test but due to other and unascertained causes. This was the only case in which the general reaction could be called severe.

In the remaining three cases a temperature rising to 100° F. was alone noted. In no case did the general reaction extend beyond the day following the inoculation.

It should be remembered that the patients tested were children and not able to describe symptoms clearly; but they were kept in bed under close observation, and no evidence could be found of general reaction more intense than stated above.

In no cases were any ill-effects observed other than the transient ones exceptionally occurring and already recorded, and these apparently need not be anticipated if not commencing within 24 hours of the inoculation.

Local Reactions to Human and Bovine Tuberculin.

The local reactions to human and bovine tuberculin were found to be essentially similar, and, without the knowledge that the one tuberculin was always inoculated on the right side and the other on the left, it would have been impossible to decide whether any one reaction was due to human or bovine tuberculin.

While variations in the degree of the local reactions between one patient and another were frequently marked, it was the exception to find considerable variation in degree between the reactions to human and bovine tuberculin in any one patient. Out of the 80 cases investigated in 23 the reactions to human and bovine tuberculin were so nearly equal that it was impossible to decide which was the greater. In 21 cases the reaction to human tuberculin was slightly greater than to bovine. In 25 cases the reaction to bovine tuberculin was slightly more marked than to human. In four cases the reaction to human tuberculin was markedly greater than to bovine. In seven cases the bovine reaction was markedly greater than the human. (See Table.)

Comparison of Results obtained by Von Pirquet Test with Bacteriological Findings.

Reactions.	No. of cases.	Bacteriological findings.			
		Human.	Bovine.	Atypical.	Negative
Approximately equal	23	16	5	1	1
Slightly greater to human tuberculin	21	13	8	—	—
Slightly greater to bovine tuberculin	25	14	6	1	4
Markedly greater to human tuberculin	4	2	1	—	1
Markedly greater to bovine tuberculin	7	5	2	—	—
Totals	80	50	22	2	6

Relation of Degree of Reaction and Severity of Disease.

No definite relationship could be established between the degree of the reaction and the severity of the disease.

Thus, G. D., No. 1, suffering from severe dorso-lumbar caries with sinuses, reacted but feebly, while L. G., No. 60, suffering from an approximately similar condition, reacted well.

G. L., No. 50, suffering from very severe tuberculous disease of both hip-joints, with a sinus in connexion with the right hip, reacted very feebly; but M. B., No. 9, suffering from similar lesions of almost equal severity, reacted intensely.

Again, G. P., No. 58, suffering from tuberculous disease of the knee-joint of moderate severity, reacted well; but H. M., No. 62, suffering from a similar but much more severe lesion, reacted feebly. And similarly with other cases.

I have formed the impression that patients who are weakly and cachectic, irrespective of the severity of the local lesions, tend to react feebly, whereas patients who are strong and vigorous, whether their local lesions be severe or slight, may show either an intense or mild reaction to the von Pirquet test.

Progressive disappearance of the reaction from the 1/64 scar upwards did not indicate diminished activity of the disease. No guide to prognosis could be found by comparing the reactions produced by the weaker and the stronger applications of tuberculin in the same patient.

Since this investigation was undertaken a sufficient interval has elapsed to estimate with some degree of accuracy the prognostic value of the quantitative von Pirquet test. As might be anticipated, the weakly and cachectic patients have not made such substantial or rapid progress towards recovery as the strong and vigorous ones. Yet the reactions obtained in the latter were more intense than those in the former. Where weak solutions as well as concentrated solutions give marked reactions the only inference which I could draw was that the patient had abundant reacting power.

One of the most marked reactions to all strengths of tuberculin, both human and bovine, occurred in a strong, vigorous, and well-nourished girl apparently in robust health but with a bad tuberculous family history, and who had been long exposed to danger of infection. In this patient I could detect no clinical or radiographic evidence of disease, though, doubtless, she was infected.

On the other hand, patients with severe lesions with progressive disease often reacted feebly. The reaction to inoculation was therefore rather a measure of the degree of resistance of the patient than of the severity of the infection.

Results of Investigation.

The final result of the investigation may be stated briefly as follows:—

1. Local reactions to inoculations of both human and bovine tuberculin were invariably present in all patients from whose pus tubercle bacilli had been isolated.
2. Though reactions were invariably present the degree of reaction varied within wide limits.
3. Weakly and cachectic patients usually reacted feebly, quite irrespective of differences in the severity of their local lesions.
4. Strong and vigorous patients exhibited wide differences in the degree of their reactions, irrespective of differences in the extent or the severity of their local lesions.
5. The quantitative von Pirquet test was not found to be of value in forming an estimate of the severity of the infection, and was of little prognostic value.
6. It was impossible to differentiate the type of tubercle bacillus with which the patient was attacked by the nature of the reaction to the tuberculin employed.

To the Honorary Medical Board of this hospital I wish to record my thanks for so readily consenting to this investigation being undertaken, and for much encouragement given and interest displayed in the progress of the research.

I desire to express my grateful thanks for invaluable assistance afforded by Dr. Eastwood, both in suggesting the most useful lines on which this investigation should proceed and in giving material and helpful criticism on the interpretation of the observations made. To my wife I am also deeply indebted for the colour photographs she took of the reactions produced, which form a permanent record of great value and afforded a useful check and supplement to direct observations made at the bedside.

A SERVICE OF MUNICIPAL MIDWIVES FOR CHELMSFORD.—In consequence of having to look after the practices of colleagues on war service the remaining doctors in Chelmsford have notified to the medical officer of health their inability to attend maternity cases. The circumstances were brought before the town council by the medical officer of health as a matter of urgency, and attention was drawn to the difficulties likely to arise in the town with its annual total of births between 400 and 500. Only three certified midwives are working in the borough, and the remaining medical men suggested that the difficulty should be solved by the appointment on the part of the council of two certified midwives to assist the local medical service. The Local Government Board had assented to the suggestion and agreed to pay one-half of the cost incurred by the council. After discussion *in camerâ* the council authorised the medical officer of health to select two midwives at a minimum salary of £75 each, on the understanding that the arrangement was to last only for the duration of the war and three months after.

THE NEW DIETETIC TREATMENT OF DIABETES.[1]

BY P. J. CAMMIDGE, M.D. LOND.

Treatment by Fasting.

IT is now many years since it was first suggested that patients suffering from severe diabetes should be starved until their urine became sugar-free, but the suggestion was not generally adopted, as it was found that an alarming increase in the excretion of acetone bodies often occurred when the fasting had proceeded for a short time. Acting on the experience gained with animals rendered more or less diabetic by partial removal of the pancreas, Allen gave a further trial to the method and found that, in the majority of cases, the acidosis which is apt to develop during the first few days of starvation subsides afterwards if the fasting is persevered with. As a result he formulated a plan of treatment which may be summarised briefly as follows:—

1. A preliminary fast is given until the urine is free from sugar.
2. When it has been sugar-free for 24 hours carbohydrate food is allowed in gradually increasing amounts, starting with green vegetables.
3. Coincident with the addition of carbohydrate, or in place of it if the carbohydrate tolerance is very low, protein is introduced into the diet, in small but gradually increasing quantities, until glycosuria occurs, or a sufficient amount is being taken to cover the basal requirement of the patient.
4. Fat is added to the diet in small quantities during the time the carbohydrate and protein tolerance are being tested, and is subsequently increased more rapidly until the fuel requirements of the body are met, provided that glycosuria does not develop and there is no increase in the acidosis.
5. The appearance of sugar in the urine at any time is taken as an indication that a fast of sufficient length to cause a cessation of the glycosuria is necessary.
6. A diet containing not more than half the carbohydrate being taken at the time sugar appears is then continued with for some weeks. Later further additions are made very gradually.
7. At intervals, depending on the severity of the case, the patient fasts, or greatly restricts the whole level of his diet, for 24 hours.
8. Adult patients are not allowed to gain in weight, but a natural increase is allowed in children, although care is taken that the gain should not be in adipose tissue.
9. Active daily exercise, carried to the point of healthy fatigue, is insisted on in all cases if possible.

The details of the method necessarily vary somewhat according to the character of the case, as Allen himself has pointed out, although few of his disciples seem to be aware of the fact. I do not propose to consider them here, however, but shall devote my attention mainly to the metabolic changes produced by the treatment and its effect on different types of glycosuria.

Chronic Intestinal Catarrh.

Everyone who has had more than a very limited experience of the condition to which the name diabetes mellitus is generally applied cannot avoid coming to the conclusion that it occurs in a variety of forms, with the one symptom of glycosuria in common, but differing widely in other respects. This variation is even more marked when the blood, urine, and fæces of a number of cases are systematically investigated and compared. During the last few years I have had the opportunity of making analyses of some 8,000 specimens from over 500 cases of diabetes, including 54 whom I have treated by Allen's method. One of the most striking results of my investigations has been the frequency with which indications of a chronic catarrh of the upper part of the intestinal tract have been met with, such a condition being present in 71 per cent. of my cases. One can hardly assume that the relationship is accidental, or that the catarrh is a secondary phenomenon, for the history very frequently shows that heartburn, flatulency, and other symptoms of indigestion preceded the discovery of sugar in the urine, often by several years, while I have found that treatment directed to the intestinal condition frequently helps to control the glycosuria, whereas reappearance or accentuation of the catarrh may be followed by increase in the sugar excretion. Cases of this description generally respond well to alimentary rest, but they are liable to relapse unless the intestinal condition is considered in the subsequent treatment.

The fasting treatment is based on the assumption that impairment of the functions of the pancreas is the cause of glycosuria in all cases, and that the improvement in carbohydrate metabolism which results is due to the physiological rest given to the gland. Although this may be true to some extent in cases with a chronic intestinal catarrh, it is probable that the starvation also has an effect on the intestinal condition, and that this helps to control the glycosuria. It may be a de-intoxicating process, as Guelpa supposed, but as Lombroso has recently shown that the intestine yields a glycolytic agent to the blood even more readily than the pancreas, it is possible that the physiological rest may influence the production of this substance, and so improve the utilisation of sugar. At any rate, the analogy between the diabetes produced in animals by partial extirpation of the pancreas and in the human subject is probably not always as close as there has been a tendency to assume, since on the one hand we are dealing with a surgical mutilation of a non-progressive character, whereas on the other we have to treat a pathological state that tends to progress, and, even when checked, to recur.

I could quote a number of cases to illustrate the relationship between the condition of the intestine and the progress of diabetes, but one will suffice:—

A lady, 26 years of age, was sent to me at the beginning of August, 1916, with the history that a month before she had begun to feel thirsty and was easily tired. As the symptoms increased she saw her doctor, who found sugar in her urine, and wrote to me for an appointment. When she came I examined her blood and found 0·24 per cent. of sugar, while a specimen of urine she brought with her contained 6·2 per cent., giving a total excretion for the 24 hours of 124 gm. Later, on a test diet containing 3½ oz. of bread and with a total carbohydrate content of 70 gm., she passed 52 gm. of sugar in the 24 hours. The urine also contained 300 mg. of acetone bodies, but no oxybutyric acid, 760 mg. of ammonia nitrogen, 450 mg. of calcium, 230 mg. of magnesium, and showed a normal creatinine and uric acid excretion, and a normal nitrogen balance. There was a very marked reaction for indican, which worked out quantitatively at 128 mg. The fæces were dark brown in colour, rather soft in consistency, acid in reaction, and gave a very marked reaction for bilivérdin, but contained no occult blood. The trypsin index was slightly subnormal, 200 units, but there was no evidence of serious interference with fat digestion or absorption.

This patient was not starved, as the glycosuria and hyperglycæmia quickly cleared when the carbohydrate intake was limited, and means were taken to combat the intestinal condition. As the latter improved the diet was gradually increased, until ultimately 70 gm. of carbohydrate were again being taken, but without there being any sugar in the urine. The main interest of the case lies in the fact that the patient had consulted me two years previously for chronic indigestion, when there was no trace of glycosuria. Her urine then contained a marked excess of indican, 188 mg., there was a high iodine coefficient ("pancreatic reaction") of 248 units, and an abnormal amylolytic ferment index of 67 units. The fæces were at that time strongly acid in reaction, contained a considerable amount of unchanged bile pigment, and gave an abnormally high trypsin index of 5000 units. Quantitative analysis showed a relative excess of combined fatty acids and a very low proportion of neutral fat. There was evidently, then, very considerable catarrh of the upper part of the intestinal tract, with secondary catarrhal pancreatitis, and in a letter to the patient's doctor I pointed out the possibility of diabetes supervening if the condition progressed, as, unfortunately, it appears to have done. (Chart 1.)

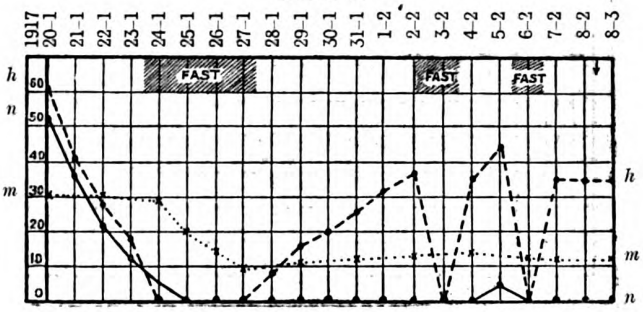
Classification.

It is comparatively uncommon, in my experience, to find evidence in the urine and fæces of advanced cirrhosis of the pancreas in diabetics. As a rule a cirrhotic, or malignant, pancreas is associated with only traces of sugar, 5 gm., or less, in the 24 hours, and it is rare also to meet with acetone or signs of acidosis, even when, as occurs exceptionally, the sugar excretion rises to 50 or 100 gm. a day.

Signs of some interference with the digestive functions of the pancreas were found, however, in the majority of my cases (72 per cent.), and in most of them (67 per cent.) there were indications that the functions of the liver were also being imperfectly carried out. In some 27 per cent. the hepatic disturbance was apparently more pronounced than the pancreatic.

It is consequently convenient to recognise three types: (1) the pancreatic, (2) the hepatic, and (3) the pancreo-hepatic—a classification I find of considerable help in prognosis and treatment.

[1] A paper read before the Harvéian Society on April 19th, 1917.



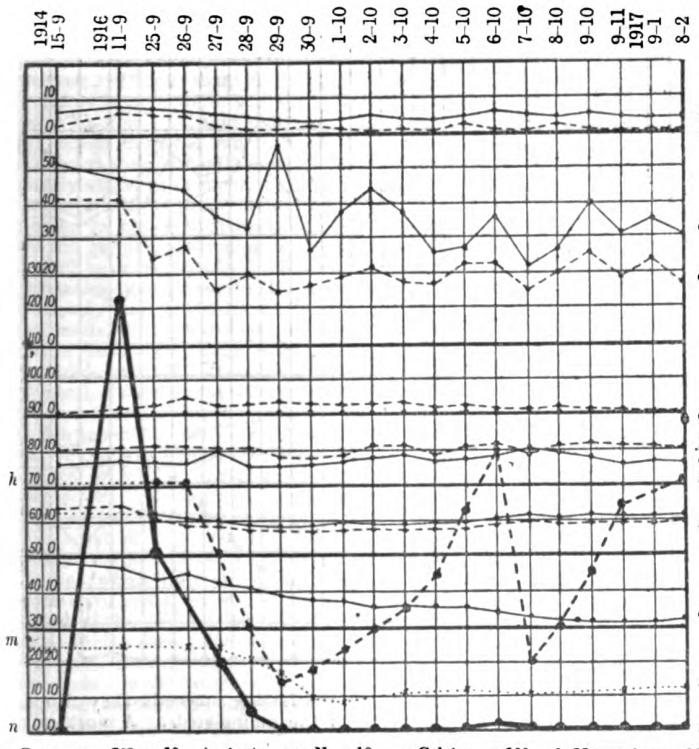
The outlook for patients with a cirrhotic pancreas is usually fairly good, provided that a suitable diet is arranged as soon as possible after the discovery of the disease. I have not found that they are materially benefited by the starvation treatment, and, as their digestive powers for all three classes of foodstuffs are deficient, the indications are rather to ensure sufficient nourishment than to worry unduly over the comparatively unimportant defect in carbohydrate metabolism.

Strictly speaking, the true hepatic type does not come under the heading of diabetes, for, although the urine reduces Fehling and Benedict's solution, &c., and gives an osazone with phenylhydrazine similar to that of dextrose, this is not due to the presence of a sugar, but to an alphaketonic acid to which I have given the name "iso-glucuronic acid," although it is more convenient to refer to it as pseudo-lævulose, since, like lævulose, it is lævorotatory. Pseudo-lævulose is met with in the urine of most advanced cases of diabetes, along with dextrose, especially if the diet contains much protein, for it is from protein that it is probably derived, but it may also occur alone and lead to an incorrect diagnosis of diabetes. To treat such cases on orthodox lines may do more harm than good. The ordinary carbohydrate-free diet only makes matters worse, and, although starvation will clear the urine of reducing substances, the same result may be obtained, with much greater comfort to the patient, by eliminating, or strictly limiting, the protein in the diet and giving an abundance of vegetables, with dextrinised starches, in the form of oatmeal, potato, &c., or pure dextrose. Under this treatment the urine rapidly becomes normal, and after a few weeks the patient can gradually resume his ordinary food, provided that protein is taken sparingly. So far as I can see at present the prognosis seems to be good, for I have several patients who have remained sugar-free and in excellent health for three or four years. It seems probable that some of the success of the various carbohydrate "cures" for diabetes is to be explained by cases of this kind.

The Pancreo-Hepatic Type: "Gouty" Glycosuria.

In what I have termed the pancreo-hepatic type there may, or may not, be evidence of intestinal catarrh at the time they come under observation, but they always show signs of pancreatic insufficiency and more or less disturbance of the functions of the liver, most likely the result of an infection from the intestine by way of the ducts or lymphatics. The relative importance of the two conditions varies considerably, and they merge into the pancreatic type in the one direction and into the hepatic on the other. There is a corresponding difference in the probable course of the case and the form of treatment most likely to be of benefit. The prognosis is most hopeful when hepatic insufficiency is the more prominent feature, such cases corresponding to what has been termed "gouty glycosuria." Typical attacks of gout are very rarely seen, however, but they are specially liable to what are termed "gouty" complications in the shape of cardio-vascular or kidney disturbances, neuralgia, and neuritis, the last two being the most common and severe. In reality these complications are dependent on the hyperglycæmia, for they persist so long as there is an excess of sugar in the blood. It is important to remember in this connexion that the disappearance of sugar from the urine does not necessarily imply a normal blood-sugar content; in fact, it is the rule for the hyperglycæmia to continue after the urine is sugar-free, so that if reliance is placed on analysis of the urine alone anti-diabetic treatment may apparently fail to control the symptoms.

CHART 2.



Pseudo-lævulose is generally present in these cases, sometimes constituting more than half the total sugar. Systematic examination of the urine usually shows, in addition, striking variations in the excretion of uric acid and creatinine, which moves in curves with several days' or weeks' interval between the crest and trough of the waves. Amino-acids are frequently present in considerable excess, and an abnormal output of urobilin is a common feature. The fæces may have the characters associated with catarrh of the upper intestine, but it is more common to find signs of chronic colitis.

In some a short period of starvation is helpful, but I have obtained the best results by merely limiting the carbohydrate and protein for several days, then giving one or two vegetable days, followed occasionally by a porridge or potato day. The subsequent diet is arranged according to the patient's tolerance for carbohydrate and protein, determined by regular blood and urine analyses. In many instances an alternating diet, arranged so as to control the pancreatic and hepatic insufficiency in turn, is the most satisfactory.

Typical "gouty" glycosuria is most common after middle life, but even in younger people a predominance of the signs of hepatic insufficiency warrants a more cheerful outlook than when they are absent. The tendency for the hyperglycæmia to persist after the disappearance of the glycosuria should be borne in mind if the treatment is to be really satisfactory, however.

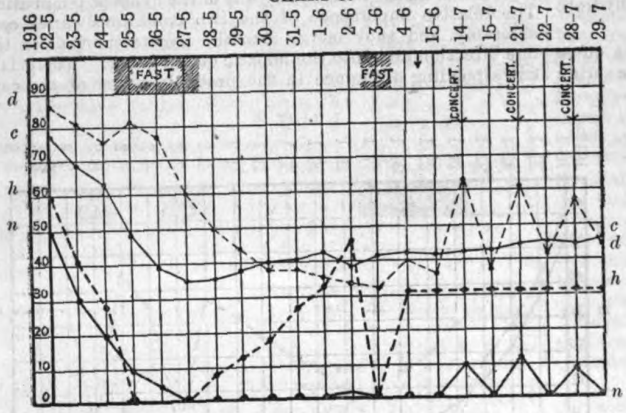


CHART 1.

a, True amm. N. × 10. *b*, Amino ac. N. × 10. *c*, Calcium × 100. *d*, Magnesium × 100. *e* (dotted), Acetone × 10. *e'* (continuous), Oxybuty. ac. × 10. *f*, Creatinine × 10. *g*, Uric acid × 10. *h*, Food carbohyd. *j*, Tot. ur. N. *k*, Food N. *l*, Indican × 100. *m*, Blood sugar × 100. *n*, Urinary sugar.

I have recently had under my care a case of this type in a young woman of 28 who had been twice treated by alimentary rest by different physicians with apparently satisfactory results at the time, but on each occasion sugar reappeared in her urine within a short period of her return home. I found that, as on previous trials, the urine became sugar-free after two days' starvation, but examination of her blood showed that it contained 0·2 per cent. of sugar, as compared with 0·29 per cent. before she was deprived of food and 0·3 per cent. when she first came under observation. It was not until she had starved for another two days that it dropped to 0·09 per cent. The patient went home with a new diet scheme and has remained sugar-free for a month, while her blood sugar has not risen higher than 0·13 per cent. (Chart 2.)

CHART 3.

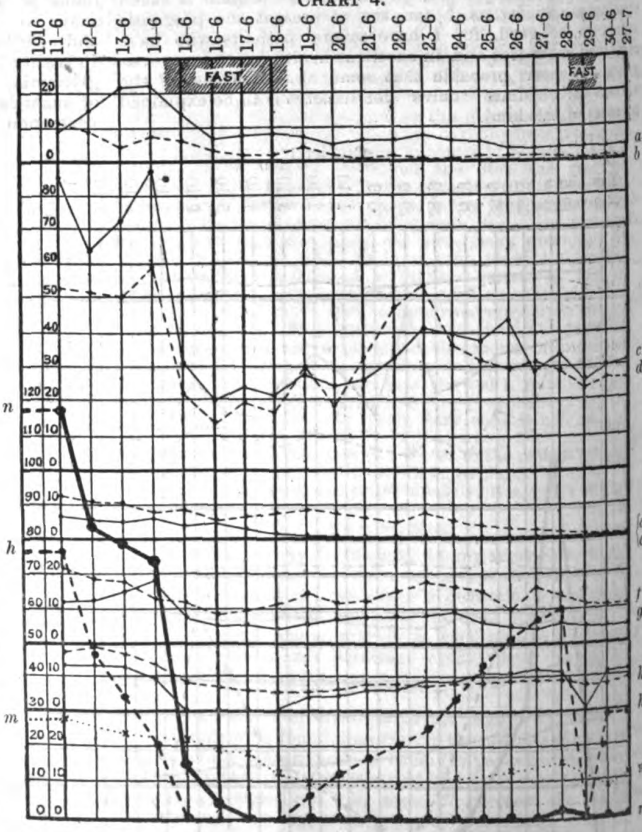
Experiences of this sort bring home to one the necessity for controlling examination of the urine for sugar by analysis of the blood, and emphasise the fact that the aim of our treatment of diabetes should be to prevent hyperglycæmia, not merely to eliminate sugar from the urine. So long as blood-sugar estimations were difficult to carry out there was a valid excuse for our relying entirely on urinary analysis, but the modern micro-chemical methods[2] require so little material and are so readily performed that we should no longer be "content with the shadow, but grasp at the substance."

The Nervous Factor.

There can be no doubt that there is a nervous factor in many cases of diabetes, although it is rarely possible to prove it. I am inclined to think that the relation between the calcium and magnesium output in the urine may afford some indication, for I have found that the latter is usually higher than the former in nervous people, and on several occasions I have seen a sudden rise in the magnesium excretion, with little or no change in the calcium, as the result of nervous disturbances or injury.

Cases in which a nervous element is probably present answer well to alimentary rest, but always do best when treated away from home and their ordinary surroundings, owing probably to the mental effect of the change in environment. I urge these patients to take as much fresh green vegetable as possible because of the inorganic salts they contain, and I find that minute doses of magnesium sulphate three or four times a day tend to steady their nervous system and consequently control the glycosuria. Purgative doses should be carefully guarded against, however.

One of the most striking examples of the influence of nervous excitement on sugar excretion I have met with was in a musician who came under my care last year. Originally he excreted about 50 gm. a day, but became sugar-free after three days and four nights of starvation, the blood sugar coming down to normal next day. On the diet that was eventually worked out for him he remained sugar-free for over a month. Three days after he returned to work he passed 10 gm. of sugar, although no change had been made in the diet, and the next day's specimen was sugar-free. The same thing happened the following week, and I then found that on each occasion he had taken part in a concert and had been particularly affected by the music. So, as an experiment, I asked him to attend another of the same series of concerts, with the result that he again passed sugar in his urine. He has since confined his activities to less exciting work, and has had no return of the glycosuria. (Chart 3.)



[2] THE LANCET, April 21st, 1917, p. 613.

Questions in Regard to Advising Fasting.

From what I have said it will be gathered that I do not look upon Allen's fasting treatment as the best for all forms of glycosuria, although I consider that it marks a great advance in the available methods and gives results which can be obtained by no other means in many instances. It should be used with judgment, however, and one should always bear in mind that the keynote of the treatment is under-nutrition. A practical question that sometimes arises, therefore, is whether a controlled, and may be a mild glycosuria, with an adequate diet and reasonable enjoyment of life, is not preferable to the theoretical ideal of a permanently sugar-free urine, which can only be obtained by a diet that will not satisfy the pangs of hunger and requires constant close supervision? The answer will depend on circumstances and the temperament of the patient. These should be considered carefully before advising the treatment, especially as, once it is begun, it must be continued; for as I pointed out in an article last year,[3] the return to an ordinary carbohydrate-free diet almost inevitably brings about a rapid increase in the acidosis, with excessive tissue waste and death from coma.

That such should be the case is not difficult to explain. Daily analysis of the urine during the fasting period shows that coincident with the fall in the sugar excretion there is a drop in the whole level of metabolism, the total nitrogen sinking until it stands at a steady level of 4 gm. or 5 gm. a day. At first there may be a rise in the output of uric acid and creatinine, but as the fasting proceeds they also sink, and the same is true of the amino-acids. A most striking change generally occurs in the acidosis. At first this, as shown by the total acidity, ammonia nitrogen, calcium, and

CHART 4.

[3] Practitioner, 1916.

magnesium, may rapidly increase, and there is a corresponding rise in the excretion of acetone bodies. Sometimes the oxybutyric acid output is also increased temporarily, but often it falls from the first day, and is replaced by a larger excretion of acetone and aceto-acetic acid. Ultimately these also begin to clear, although some acetone may be excreted for a considerable time. Finally the ammonia, calcium, and magnesium, with the total acidity, reach normal levels, and the urine may afterwards become alkaline as vegetables are taken. After feeding is commenced, and particularly when protein foods are introduced into the diet, the total nitrogen rises again, but if the dieting is properly carried out the patient remains in nitrogenous equilibrium, and there is no increase in the acidosis. (Chart 4.)

Supposing now that a patient in this condition is suddenly transferred to a "carbohydrate-free" diet, the immediate effect of the largely augmented protein intake is to stimulate metabolism some 50 per cent. or more over what it would have been had the same caloric value been given in the form of carbohydrate, with the result that there is rapid tissue waste, with a greatly increased excretion of amino-acids, uric acid, creatin, and creatinine, a rise in the formation of acid bodies, and consequently increasing depletion of the alkaline reserves of the body, which are no longer being replenished by the bases contained in the vegetables that previously constituted so large a part of the diet. More fat and less carbohydrate are also being taken, so that the products of the imperfect combustion of fat are increased and added to the total acid bodies, still further depleting the alkaline reserves in the organism. Choked by the accumulated "clinker" of a diet it is incapable of metabolising, and worn out by the attempt to utilise its own tissues as a source of energy, the body soon becomes unable to carry on its work and the patient dies of diabetic coma.

Acidosis.

Formerly the most common cause of death in diabetes, coma should now be one of the rarest, for in starvation, followed by a largely vegetable diet, we have a powerful weapon for preventing and controlling the acidosis from which it arises. Essentially, acidosis results from the imperfect oxidation of fat, and this in its turn is dependent upon the faulty combustion of carbohydrate by the body, for fat seems to be a less readily oxidised foodstuff than sugar and needs the fire of burning sugar to bring about its complete combustion. It has been calculated that one part of dextrose to three parts of higher fatty acids is required for the purpose. If less than this proportion is available the fat "smokes," as it were, the smoke being represented in the body by abnormal acid products. Since the maximum rate at which dextrose can be oxidised by the diabetic is always lower than in health, the diabetic is not capable of completely utilising as much fat as a normal individual, so that acidosis is more prone to develop.

In order to check a diabetic acidosis it is necessary to restore the proper relation of fatty acid to dextrose oxidation, which may be done by diminishing the fat in the body and increasing the power to utilise carbohydrate. Fasting will obviously ensure the former, and it is well known that it also tends to increase carbohydrate tolerance, so that abstinence from food is the most rapid method of restoring the required balance. The immediate result of starvation will depend, however, on the amount of fat stored in the tissues, and therefore on the nature of the previous diet. If a diet rich in fat has been taken and there is a considerable deposit of adipose tissue, the sugar available may be quite inadequate to ensure anything like complete combustion, and there will consequently be a rapid rise in the acidosis until the fat has been used up and a more normal relationship has been reached, but even then the acidosis may continue to increase, for proteins contain fatty acid radicals, yielding acid bodies when they are imperfectly oxidised, and some diabetics have lost the power of utilising more than a small proportion of the dextrose contained in the protein molecule, which normally serves for their combustion. By persisting with the starvation the ability of the organism to utilise carbohydrate usually becomes so far restored that enough is available to control the formation of abnormal acid end-products from both sources.

Some Practical Conclusions.

From a consideration of these facts it is obvious that all cases of diabetes cannot be expected to react to starvation in the same way, the determining factors being the amount of stored fat, the power to utilise the carbohydrate deposited in the form of glycogen, and the extent to which sugar of protein origin can be made use of. Hence three practical conclusions may be drawn:—

1. There is more danger of serious acidosis developing during starvation in fat than in thin diabetics.

2. When acidosis is present the patient should be prepared for the starvation treatment by being put on a fat-poor diet for several days before abstinence from food is commenced.

3. An initial increase in the acidosis is to be expected, but should not stop the treatment unless it assumes threatening proportions, as it will most likely subside if the fasting is persisted with.

Occasionally nausea, marked prostration, increasing drowsiness, and deep breathing, in conjunction with the characteristic changes in the composition of the blood, alveolar air, and urine, indicate a severe and progressive acidosis. The fast should then be terminated for the time being and the treatment directed to the acidosis. A restricted diet, consisting chiefly of green vegetables, with alkaline therapy, for a few days will generally suffice to control the condition, and a further fast will then usually result in improved carbohydrate tolerance and a sugar-free urine without increasing the acidosis.

During the fasting periods weak patients should be kept in bed, but the more vigorous should be encouraged to take as much exercise as is practicable, since the duration of the fast is shortened thereby. After feeding is commenced regular exercise should be continued, and even weak patients should have massage or regulated exercises. Short periods of vigorous exercise are to be preferred to long monotonous walks, and are particularly advantageous immediately following a meal containing carbohydrate, but care should be taken to avoid excessive fatigue. Exercise is of especial benefit for children, as it promotes the building of active tissue at the expense of fat and favourably influences growth. Mental occupation is most desirable, and patients should be encouraged to continue their ordinary work as far as possible.

The Protein Intake.

Long before the appearance of Allen's work I had come to the conclusion that quantitative regulation of the diet is necessary in all cases of glycosuria and that control of the protein intake is quite as important as adjustment of the carbohydrate, for the exhaustive chemical analyses of the excreta carried out in most of my cases showed that merely eliminating sugar from the urine does not suffice to control the disease if the patient is not in nitrogenous equilibrium, and that the only way to maintain this condition is to teach him to take his diet quantitatively. A number of papers published between 1912 and 1915 embodied these conclusions, and it is therefore gratifying to find that they are important features of Allen's plan, although I regret to see that in the attempt to simplify the treatment a rule-of-thumb method for establishing a nitrogenous balance is generally advocated instead of the more laborious, but certain, determination by direct chemical analysis.

Systematic examination of the urine shows that when the protein in the diet of a diabetic is gradually increased beyond a certain point, varying with each case, evidences of a disturbance of nitrogenous metabolism appear before sugar can be demonstrated in the urine, and that if these are at once recognised and the protein cut down glycosuria can be prevented. Merely to rely upon the appearance of sugar in the urine is therefore far from being an ideal method of regulating the treatment. My experience with several patients who have come under my care after treatment with alimentary rest by others has confirmed my distrust of this "hit-or-miss" process of determining the protein tolerance.

As an example I may quote the case of a young man who consulted me in the beginning of January. He had been treated in the previous November by a physician who has copied Joslin's method of applying the fasting treatment, and stated that after a 24 hours' fast his urine had been found to be free from sugar. His final diet, on which he had remained sugar-free according to Fehling's test, contained 60 gm. of carbohydrate and 16 gm. of protein, with as much fat as he cared to take. He complained that although he had strictly adhered to the quantities allowed he was steadily losing strength, was exceedingly miserable, and suffered from frequent attacks of cramp.

Temporarily continuing the same diet I found that a 24 hours' specimen of his urine gave no reaction for sugar with Fehling, and showed only a slight turbidity with Benedict's test, while quantitative analysis gave just over 1 gm. of sugar for the day. Determination of the sugar-content of the blood showed 0·19 per cent. two hours after the morning meal, so there was evidently some hyperglycæmia. Further

investigation of the urine revealed other important changes. The total nitrogen exceeded the intake by more than 2 gm., there was a very high uric acid output, the creatinine excretion was nearly double the normal, the amino-acid nitrogen amounted to 200 mg. a day, the true ammonia was just over 1 gm., and there were 140 mg. of oxybutyric acid and 893 mg. of acetone bodies, besides an excess of calcium and magnesium.

After a few days on a fat-poor vegetable diet, and one day of starvation, the blood sugar fell to 0·06 per cent., the total nitrogen of the urine dropped to 5 gm., the oxybutyric acid disappeared, and the uric acid, creatinine, ammonia nitrogen, calcium, and magnesium excretions fell to normal, while only traces of amino-acids could be found. His diet was then gradually worked up again, guided by the results of daily complete analyses of the urine and blood-sugar estimations, when it was found that, although his carbohydrate tolerance still stood at about 60 gm., he could only be kept in nitrogenous equilibrium, and his blood sugar maintained at normal figures, if the nitrogen intake did not exceed about 10 gm. a day. With a diet containing these amounts, and a specified quantity of fat, he became more cheerful, ceased to lose weight, and no longer suffers from cramp.

I need not discuss in detail the adjustment of the carbohydrate content of the diet to the patient's tolerance, as, provided he is kept in nitrogenous equilibrium, it is a comparatively simple matter, although I should again like to emphasise the importance of controlling the urinary analysis by examination of the blood. In passing I may also remind you that the carbohydrate and protein in the diet of a child should not be increased at the same rate as in an adult, but proportional to the weight, 1 gm. of carbohydrate for a child of 15 kg., for instance, being about equal to 4 gm. for an adult.

The Fat Intake.

The regulation of the fat intake in diabetes requires much more care than is frequently given to it. Hitherto fat has generally been regarded as a "make-weight" by which the caloric value of the diet can be adjusted to the theoretical requirement worked out from the patient's weight, but modern research suggests that this idea, like that formerly held with regard to proteins, must be abandoned, and that careful control of the fat-supply is no less important than a correct adjustment of the protein and carbohydrate intake.

It is still a debatable point whether sugar can be derived from fat, but apart from this the recent experimental work of Allen on dogs has shown that restriction of the carbohydrate and protein in the diet alone only serves to suppress the symptoms temporarily, and that unless the total metabolic load on the weakened assimilative functions is lightened by keeping the fat also within strict limits, downward progress, similar to that often seen in the human subject, occurs. The observations of Bloor on the blood have likewise demonstrated that defective fat metabolism is much more common in diabetes than has been supposed, for he found that abnormal lipoid values occur very frequently, apart from obvious lipæmia. Bloor showed that these lipoids originate from the fat of the food, an increase leading to an accumulation of fat and its metabolites in the blood until a point is reached when they can be no longer held in solution by the plasma, while fasting and a reduced fat intake have the opposite effect and bring about more efficient metabolism. There appears to be no definite relation between the lipoid content of the blood and the excretion of acetone bodies in the urine, however. Regular determinations of the lipoids in the blood would no doubt afford the best guide to a correct adjustment of the fat content of the diet and prevent overloading of the faulty mechanism, but the process is too long and complicated for routine clinical work at present, and one has to fall back upon such rough tests as the appearance of the blood and changes in weight.

I have already indicated the importance of not commencing the fast in severe cases with acidosis until the patient has been prepared by a few days on a fat-poor diet, but it is equally important that fat should not be added to the diet subsequently until a considerable tolerance for carbohydrate and protein has been established. Eggs are therefore often not the best form of protein to start with, as is usually advised. A creamy blood, an increase in the ketonuria, or the appearance of sugar after more fat has been introduced into the diet should be controlled by reducing the fat intake; otherwise it is best so to regulate the diet that a progressive loss of weight is prevented, while a gain, or rather an increase in adipose tissue, is avoided.

Periodical Curtailment of Diet.

Even when the total caloric value of the diet and the body mass have been reduced to correspond to the defective assimilative capacity of the patient, there is a risk that his metabolic powers may still be over-taxed if they are constantly worked at the same level. It is therefore advisable that the diet should be materially curtailed at regular intervals. The extent of the reduction and the frequency with which it is required will depend upon the severity of the case and the response to the preliminary treatment, so that no hard-and-fast rule can be laid down, but generally an all-round reduction by one-half for one day each week is required. In some cases this means that the patient must fast, in others that he is limited to low-value green vegetables, maybe with two or three eggs, while in others again a fair amount of carbohydrate food can be taken, provided that the fat and protein intake are kept low. When carbohydrate tolerance is very defective it may be advisable to prescribe one or two vegetable days in addition.

As the patient improves his allowance of carbohydrate is gradually increased, and the stringency of his fast, or semi-fast, days reduced, but he must advance a step at a time, with sufficient interval between each to test thoroughly his powers of dealing with the larger ration. The protein allowance in any case should aim at the standard of Chittenden rather than that of Voit, and no addition should be made, under any circumstances, until the patient has been in nitrogenous equilibrium for several weeks and all traces of acetone bodies have disappeared from the urine; even then it should be increased very cautiously, guided by the relation between the nitrogen content of the diet and the output in the urine. In this connexion I may point out that many so-called diabetic foods and breads, if not fraudulent as regards their carbohydrate content, consist chiefly of protein, which must be allowed for when they are used. As ordinary bread is rarely well tolerated by diabetics, some substitute of this description is often most useful, but it should never be given unless its carbohydrate, protein, and fat content are known and its composition is reliable.

Acid-Base Equilibrium.

I should have liked to consider in detail a subject to which I have recently devoted considerable attention, namely, the influence of the inorganic salts of the diet, and particularly the alkaline bases, on metabolism in diabetes, but a brief reference must suffice at present. Incidentally I have referred to one aspect of the matter when speaking of nervous disturbances, and it is needless to remind you of the importance of alkalies in treating acidosis, but there are other problems involved than these. Experiment has shown that the mechanism regulating the level of the blood sugar is peculiarly sensitive to disturbances in the acid-base equilibrium of the body, acid production leading to hyperglycæmia, while alkalosis exerts an opposite influence. Since meats and cereals are in general acid-producing foods, while vegetables and fruits usually yield an excess of bases, a diet rich in protein will tend to raise the sugar content of the blood, whereas a vegetable diet will lower it. May this not be one of the reasons why the largely vegetable diet usually given after the fast in the alimentary rest treatment is associated with an increase in carbohydrate tolerance, and a partial explanation of the deleterious effect of more protein than is needed for making good the actual wear and tear of the body?

Applying these ideas concerning the influence of the acid-base equilibrium of the body on carbohydrate metabolism to treatment, Murlin and Kramer, and more recently Underhill, have reported considerable improvement in cases of glycosuria subjected to careful alkaline therapy. Underhill employed large doses of sodium bicarbonate, while Murlin and Kramer used normal sodium carbonate, given intraduodenally in 1 per cent. solution. That alkalies increase sugar tolerance is an old idea which has been under a cloud for some years, but old clinical beliefs often contain a germ of truth, and it seems that further research on these lines may reveal methods of controlling glycosuria other than mere limitation of the diet.

At present our only reliable means of combating the disease is management of the diet, but in order to obtain the best results and actually halt the diabetic process it is necessary that it should be carried out with knowledge and as nice discrimination as the selection and prescription of a drug. Time and care devoted to the chemical aspect of each case render the task easier, and would prevent the empirical employment of one routine method, so saving many patients from unnecessary hardships and inconveniences. It is not

enough to consider only the glycosuria, or even the end-products of metabolism in the urine, the information to be obtained from analysis of the blood and fæces should also be taken into account, and I venture to think that the time is coming, and will come shortly, when a physician who attempts to treat a case of diabetes guided only by examination of the urine for sugar will be held as guilty of negligence as the present-day surgeon would be who failed to employ radiography when treating an injury of the bones or joints.

Nottingham-place, W.

THE LOCAL TREATMENT OF MENINGOCOCCUS CARRIERS WITH ANTISEPTICS.

(A REPORT TO THE MEDICAL RESEARCH COMMITTEE.)

BY P. FILDES, M.B., B.C. CAMB.,
ASSISTANT BACTERIOLOGIST TO THE LONDON HOSPITAL; HONORARY STAFF SURGEON, R.N.V.R.;
AND
P. B. WALLIS, B.A. CAMB., M.R.C.S., L.R.C.P. LOND.,
SURGEON, R.N.
(*From the Laboratory, R.N. Hospital, Haslar.*)

OWING to the measures adopted in the Navy to limit the spread of cerebro-spinal fever a large number of carriers were detected in the Portsmouth depôt and isolated in a special camp. It then became necessary to attempt to sterilise the throats of these men, and, although from analogy with other diseases the local application of antiseptics appeared likely to be unprofitable, it was thought desirable to give these a trial. If the antiseptic did not destroy the cocci in the throat, it was possible that it might prevent the cross-infection from one man to another. Further, the use of inhaling rooms in the Army had been said to give encouraging results.

In an experimental treatment of this sort there were three important matters to be considered: (1) The antiseptic to be used; (2) the method of application; and (3) the index of cure.

1. *The Antiseptics Used.*

The antiseptics most thoroughly tested were chloramine-T and acriflavine. Dakin's new dichloramine compounds came to hand too late in the season to make a satisfactory test. Other antiseptics were boracic acid, carbolic acid, magnesium hypochlorite, formalin, potassium permanganate, guaiacol, and several others. In addition to these, we administered to a few men a placebo in the form of tablets of formalin.

2. *The Method of Application.*

Chloramine-T was applied in two different ways:—

(*a*) In an inhaling chamber, the drug being dispersed as a fine cloud by a high-pressure steam-jet. This apparatus differed in design from that proposed by Colonel M. H. Gordon for the Army, but no doubt gave similar results. A 5 per cent. solution of chloramine-T was used in the reservoir of the nebuliser; this strength was found to give as powerful an atmosphere of chlorine as was pleasant. The room accommodated about 10 men and these remained therein for about 15 minutes per diem. They were instructed to breathe strongly through the nose during this time, but there was no way to ensure that these orders were carried out, and in many cases they probably were not.

(*b*) In a nasopharyngeal spray. This was a glass hand-spray made by one of us, the nozzle of which was readily slipped through the mouth into the nasopharynx. Two or three pumps were given with the bellows and the chloramine-T (2 per cent.) thus came copiously into contact with the whole nasopharynx and often dripped from the anterior nares. This treatment was applied once a day.

Acriflavine (kindly supplied to us by the Medical Research Committee), in a strength of 1 in 500 in salt solution, was applied daily with our nasopharyngeal spray.

The other antiseptics mentioned were used in the earlier stages of the investigation. They were all applied with Burroughs, Wellcome, and Co.'s "Glaseptic" nasal spray until the drug could be felt in the nasopharynx. The strength of boracic acid was one drachm to the pint, of carbolic 1 in 100, of formalin 1 in 200, and of potassium permanganate 1 in 1000.

3. *The Index of Cure.*

The apparent value of these antiseptic treatments depends very largely upon what end it is proposed to achieve and the exact manner in which the process is carried out. In general the technique is to apply the treatment until swabs taken from the nasopharynx fail to reveal the meningococcus. The man is then looked upon as cured. There are, however, a number of fallacies which must be avoided.

(*a*) The treatment must not be carried on continuously during the whole period of quarantine for two reasons. First, the treatment if applied on the day that the swab is taken will directly vitiate the result. We have therefore always allowed 24 hours to elapse after treatment before the swab is taken. Secondly, the treatment if applied continually will readily diminish the number of meningococci or reduce their vitality so that they will not grow in culture, but when treatment is stopped they will frequently reappear again. It is therefore essential not to apply treatment continually, but to give the man a chance of relapsing before he is said to be cured. In practice the routine has been as follows:—1. Upon receipt a positive carrier is treated once a day until his next swab is due—that is to say, until six days have elapsed since the first swab. In practice this is usually one or two days' treatment. 2. Treatment is stopped 24 hours before the swab is taken. 3. It is continued after the swab is taken until the report is received. 4. If this is negative treatment is stopped, and if the man remains negative on weekly test, no further treatment is given. 5. If the report is positive, treatment is continued until the next swab is due. More recently, in order to give the "positives" a greater degree of treatment, we have swabbed them while positive every 14 days instead of every week. On a negative swab being obtained, however, we reverted to the weekly tests.

(*b*) A certain period of time must be allowed to elapse after a negative swab is obtained before a man is said to be cured, in order that the permanency of the cure may be established. It is customary for a certain number of negative swabs at fixed intervals of time to be required before a man in the services is allowed out of quarantine. The precise number of swabs has never, to our knowledge, been accurately worked out. In the Army it was two, while the Navy at one time required six weekly negative swabs. During the past season this number was reduced to four. All our carriers, therefore, have been retained under observation until at least four negative swabs have been obtained, and we are thus able to give more accurate information as to the permanence of cure in these cases.

The following figures show the number of relapses which occurred after various numbers of "negatives" had been obtained. 375 carriers (pure "Gordon" types) were subjected to the "4-negative" standard. Of these—

137 relapsed (185 times) after 2 "negatives" = 36 per cent.
63 ,, (74 times) ,, 3 ,, = 16 ,,

A small number of men were examined by mistake or for various reasons for more than the necessary 4 "negatives." Of these—

13 carriers relapsed after 4 negative swabs.
5 ,, ,, ,, 5 ,,
4 ,, ,, ,, 6 ,,
2 ,, ,, ,, 7 ,,

The number of carriers who were examined after four "negatives" is so small that no statistical capital can be made out of these latter figures. Nevertheless, it is certainly remarkable that so many relapses were observed in so few cases. From the foregoing figures it is clear that if two negative swabs are taken as the index of cure no less than 36 per cent. of the men will, in fact, not be cured, and will be returned to the community in the same condition as they were before they were isolated. It is also clear that under these conditions of "cure" a form of treatment may readily be supposed to have a value which is quite fictitious.

The number of negative swabs which constitutes a cure is a practical question which has to be decided with due regard both to inconvenience to the Service and to safeguarding the Service. It appears to us that it would be irrational to undertake a very extensive system of control, as in the Navy, and then to stultify that system by prematurely discharging one-third of the proved carriers on two negative tests. Clearly the proved carrier is the man on whom attention should be most concentrated if extensive administrative measures are taken against this disease at all, and thus it would appear that the naval routine of four "negatives" is better than two "negatives." The number of men involved

when the carriers are only derived from contacts is so small relatively to the whole Service that four "negatives" should not entail undue inconvenience. In all our cases, therefore, the index of cure has been four consecutive negative swabs taken at weekly intervals. During the whole of this time no treatment has been applied in order that every opportunity for early relapse might be present.

The Results of Treatment.

Owing to the relatively small number of carriers and to the fact that at first the treatment was often changed, the estimation of the value of these different methods is difficult. On examining the figures, however, it is soon found that there is another factor which enormously increases the difficulty—namely, that one-third of the men become cured immediately upon entry into the isolation camp *whatever the treatment applied to them may be.* Thus of 375 carriers of pure "Gordon" types, 124 registered their four consecutive negative tests immediately upon entry into the isolation camp. The treatment applied to these men was practically nil, since by the time the "doubtful" colonies had been proved to be positive, and the man had been removed to the isolation camp, the greater part of the week had passed and only one, or at the most two, days' treatment remained before it had to be stopped preparatory to the next swab. When it is remembered that this treatment consisted of formalin tablets and boracic nasal sprays, as well as chloramine-T and acriflavine nasopharyngeal sprays, it appears justifiable to us to regard the effect of treatment as nil, and to assume that these men cleared up spontaneously. Since, then, one-third of the men are cured spontaneously, a drug must be very decisive in results before its curative action becomes very obvious.

The effect of the antiseptics has been estimated in two ways: (1) by calculating the ratio of cures to the number of men treated by each antiseptic; and (2) by counting the number of men who obtained 4, 3, 2, 1, or no "negatives" *immediately* upon starting upon a particular treatment.

TABLE I.—*Showing the Cures Effected by Various Treatments.*
TABLE II.—*Showing the "Immediate Negatives" obtained by Various Treatments.**

TABLE I. TABLE II.

Treatment.	Number treated.	Number cured.	Per cent. cured.	Number treated.	Immediate negatives. 4	3	2	1	0
Chloramine-T in inhaling room ...	85	43	50	91	38	2	15	4	32

Average	632	330	52	—	—	—	—	—	—

* In Table II. the cure is credited to that treatment under which the man was last.

Table I. shows that about 50 per cent. of the men treated by any method were cured. Any variation in the percentage is not greater than might be produced by chance and has no significance.

Table II. shows that with each form of treatment 40–50 per cent. of the men are cured immediately; with boracic acid alone is the figure much higher, but here the factor of error due to small numbers comes in acutely. This percentage (40–50) corresponds roughly to that given by all treatments together (33) which, as has been explained, may be assumed to be no treatment. The difference between the 33 per cent. of no treatment and the 40–50 per cent. of treatment is due, not to the efficacy of treatment, but to the fact that the two figures are calculated from two different series of men. The 33 per cent. relates to carriers of meningococci which agglutinate with monovalent sera, while the 40–50 per cent. refers to a series which includes in addition a number of carriers of cocci which agglutinate feebly or not at all with monovalent sera. These latter often fail to agglutinate, and therefore these carriers are more easily "cured."

It is clear that the therapeutic effect of none of these antiseptics is sufficiently great to class one as better than another.

On examining the figures of those men who remained positive after treatment, it is again observed that the results are fairly similar; about one-third of the men failed to obtain a negative immediately after treatment. Acriflavine and boracic are exceptions to this rule; the former showed only 4 positive in 101 after treatment, and the latter 1 positive out of 31. In the case of acriflavine these positives have passed into the group of "1 immediate negative," and there is some evidence that acriflavine actually does produce a transient inhibition of the bacteria.

Conclusion.

Looking at the results as a whole, we conclude that one-third of the men recover spontaneously, and that none of the methods of treatment tested has any conspicuous merit, nor has one any obvious advantage over another. This result is what might be expected from analogy with work on diphtheria carriers.

We are much indebted to Dr. John Brownlee, statistician to the Medical Research Committee, for opinions upon figures submitted to him.

ON THE CLOSURE OF WAR WOUNDS IN HOME HOSPITALS.

BY JAMES PHILLIPS, F.R.C.S. EDIN.,
MAJOR, R.A.M.C. (T.C.); OFFICER IN CHARGE, SURGICAL DIVISION, BRADFORD WAR HOSPITAL.

AS the result of experience gained during the last two and a half years it has been found possible to render wounds, the discharges from which have been teeming with pus organisms, surgically clean, so that in a period varying from a very few days to at most a week or two, an infected wound can be stitched up with every prospect of something approaching primary union taking place.

The two surgeons whose names are chiefly associated with these results are, in this country, Rutherford Morison and, in France, Carrel. Through the courtesy of Sir Berkeley Moynihan I was privileged in October, 1916, to see Mr. Rutherford Morison demonstrate his method of treating war wounds with "B.I.P.P.," and also to hear Dr. Sharman, of Pittsburg, who had spent some months in France seeing war surgery, relate his experiences at Carrel's hospital. More recently I heard Colonel C. J. Bond, of Leicester, describe the Carrel-Dakin treatment, and not less useful have been several discussions on the subject with Colonel Moynihan himself.

Between November, 1916, and the end of June, 1917, I have performed well over 300 operations for the closure of war wounds at the Bradford War Hospital and have gradually evolved a technique (which will probably be further modified as my experience grows, but) which already gives me results which I regard as very satisfactory and which I propose to describe in this article. This I shall do at some length, since I consider that the highest percentage of good results can only be obtained by following out the method in detail.

The Carrel, B.I.P.P., and Bradford Methods.

The Carrel method.—The Carrel treatment consists (1) in the sterilising of the wounds, and (2) in the suture of the surgically clean wound. When a case is seen soon after the wound has been inflicted an anæsthetic is given; the skin around the wound is thoroughly cleaned and the wound is freely opened up, foreign bodies, lacerated muscles, damaged skin edges, and loose bone fragments are removed, all bleeding is stopped, and special tubes are inserted, through which is instilled into the wound every two hours a solution containing 0·5 per cent. of active chlorine—the object being to keep an efficient antiseptic constantly in contact with the whole of the wound surface. The discharge is microscopically examined every day or two, and in from 5 to 11 days the wound is usually sterile enough (1 organism to each 4 microscope fields) to enable it to be completely stitched up and for primary union to result. Colonel Moynihan tells us that notices are hung up in Carrel's wards to the effect

that every wounded man whose wound suppurates has a right to demand an explanation from his surgeon!

Now the problem of wound closure in the British war hospital is not so simple as this. Cases come over from France in hundreds labelled "Carrel-Dakin treatment"—with one convoy over 40 such cases came to Bradford—but they are almost without exception suppurating, generally profusely; commonly the tubes have been removed, and if they are still in the instillation of Dakin's fluid has been intermitted. The process of wound cleansing has to be started all over again, and although, sometimes in a few days, more often only after a week or two have elapsed, the bacteriologist is able to report that the wound is surgically clean, my experience is that simple suture undertaken then is likely to be followed by something disappointingly short of primary union. Nor is this to be wondered at when we remember how real a fact latent sepsis is; how, many months after a wound has healed, forcible movements or even simple massage may light up infection—suppuration, or tetanus, or even gas gangrene—it is easy to understand that, during the suppuration period, organisms will have had time to "dig themselves in" to the deeper tissue cells, from which they are able to sally forth to upset the healing process in the stitched-up wound.

The B.I.P.P. method and its limitations.—Morison's B.I.P.P. method aims at introducing into a wound, admittedly infected, chemicals which for a long period continue to generate disinfectant agents, which experience has shown will effectually keep under the infection and allow healing to proceed. In many cases the results are excellent, but commonly some area of the wound has to heal by granulation. Occasionally pus collections form and require draining, and whenever there is much loss of tissue and consequent tension on the stitches these are likely to cut out and allow the skin edges to gape.

The Bradford method.—The method which experience has led me to adopt includes something of the B.I.P.P. method along with the Carrel-Dakin treatment, and may now be described in detail.

I. *Wound Sterilisation.*

Most of the wounds as they arrive from France have already been opened up. Where pus is pocketing in the track of a through-and-through wound, or beneath or between two adjacent muscles, or where loose bone fragments or other devitalised or foreign bodies are present, an anæsthetic must be given and the wound cleansed and laid freely open. *The skin incision whenever possible should extend the whole length of the wound.* A wound with a narrow bottle-neck opening may have a Carrel tube in it and Dakin's fluid instilled into its cavity, but it is nevertheless not being treated by Carrel's method.

The ideal Carrel wound is a basin which can easily be kept full to the brim with Dakin's fluid. Such a wound would be a deep flesh wound in the front of the thigh. Into the depths of such a wound are passed one or more tubes of about ¼ inch calibre, of which the distal end is closed by a ligature and which has a few tiny side holes punched in that part of the tube which lies in the wound. The tubes are connected with a reservoir containing Dakin's fluid hung over the bed, and every two hours the nurse releases a clip and allows just enough fluid to escape to fill the wound to the brim without allowing any to run over.

Posture can often be utilised to make it easier to apply the proper treatment—e.g., a man with a wound on the outer surface of his right thigh can be made to lie comfortably on his left side—so that his wound is uppermost. And it is remarkable how contentedly a man with a wound of the buttock will lie for days together on his face.

When the wound is so situated that it cannot be made to hold fluid basinwise, gauze 8 to 12 thicknesses is cut exactly the shape of the wound but about ⅛ inch less in diameter, so as to leave a tiny red margin all round when the gauze is packed into the wound. The Carrel tube is placed deep to the gauze, which is saturated with fluid every two hours.

In some of the hospitals in France an elaborately constructed wool and tissue covering is pinned around the affected limb. Personally I favour extreme simplicity of dressings; a cage over the wounded part, and no dressing but simply a dressing towel placed so that it keeps dust and flies from the wound but not touching the wound itself, since if it is allowed to do so it will absorb fluid from the wound surface and so tend to defeat the object sought. A really careful nurse who understands the principles of the treatment can generally manage to regulate the supply of Dakin's solution, so that there is no overflow to irritate the skin; if fluid does run over and threaten to produce dermatitis, the simplest preventive is boric ointment melted in a glue-pot and painted with a brush on to the threatened skin.

The bacteriological examination.—Every third or fourth day a platinum loop-full of the discharge is taken from the wound surface wherever it looks least healthy and spread thinly and *uniformly* evenly on to a microscope slide. It is fixed by heat and stained (our bacteriologist, Dr. R. Honeyburne, finds brilliant-green a very satisfactory stain, differentiating well between nucleoli and organisms) and examined with a 1/12 inch oil immersion lens. The organisms on ten fields are counted, and I make it a rule not to attempt to close a wound until two reports of an average of less than three organisms per field have been returned.

II. *Wound Closure.*

Flesh wounds.—1. The skin around the surgically clean wound is cleansed in the ward by the nurses, much as the skin prior to a clean operation is, but only so far as it can be done without causing pain. In the theatre under general anæsthesia the skin is vigorously rubbed over with biniodide of mercury in spirit (1 : 500). 2. The edges of the wound are trimmed with a scalpel evenly all round—rather less than ¼ inch of healing edge being removed, but in wounds which are tending to scar over all the scar tissue is cut away. 3. The granulations are thoroughly curetted. 4. The skin edges are undercut; even in a small wound where the edges will easily come together they are undercut, as I find that much more accurate apposition is thus obtained. In large wounds, particularly with much loss of tissue, extensive undercutting is done. 5. Any definitely bleeding vessels are tied (oozing does not matter), the whole wound area is swabbed with methylated spirit and a little B.I.P.P.—never more than an eggspoonful and in a smallish wound half that quantity—is scrubbed into the raw surface with the gloved fingers. 6. Wherever possible any raw muscle surface is closed by bringing together the edges of the deep fascia (exposed by the under-cutting) with a running stitch of stout catgut. 7. Thick silk sutures (No. 5 pedicle silk boiled and soaked for 48 hours in tinct. iodi) are passed through the skin and the deep layers of the wound at intervals of about ½ inch and tied tightly so that no "dead cavity" is left. Where there is tension on the part I find the most useful stitch a combination of a mattress with a simple surgical stitch. The mattress stitch is passed widely and deeply and pulled tight at one corner with a single loop; the needle is then passed through the skin edges, and on tying the final surgical knot wide apposition of the deep structures and accurate approximation of skin edges are obtained. 8. A continuous catgut stitch is used to complete the coaptation of the skin edges. 9. The skin is cleaned and smeared over with Moynihan's cream[1] and a simple dry gauze and wool dressing applied.

The dressing is not touched for 14 days. It is then removed; any discharge is wiped away and Moynihan's cream and another dry dressing are applied. At the second dressing a week later the stitches are removed, and never before.

Of 10 cases so treated I find that 7 or 8 will have healed practically by first intention, 1 or 2 will have gaped a bit at one part, leaving a superficial granulating area, and the tenth—practically always one where there has been loss of tissue and consequent tension on the stitches—will be a failure, at any rate in large part, and will require to be done again, or perhaps skin-grafting will be necessary.

It is not simply that healing is by this means accelerated and frequency of dressings enormously reduced; lineal non-adherent scars take the place of wide adherent disabling scars. I am sure that for years to come it will be our duty to reduce disability in war pensioners by excising the painful scars which limit movements and reduce earning capacity, and I have already performed a considerable number of such operations with the happiest results.

Compound fractures of long bones.—In cases of recent wounds with compound fractures I do not attempt Carrel's treatment but adopt Rutherford Morison's

[1] A mixture consisting of as much bismuth carbonate in ½ : 1000 watery solution of HgI_2 as will make a thick paste.

treatment, because by so doing the limb can at once be fixed in a dressing which does not require to be changed for a fortnight, and so a great amount of suffering is done away with. The following is a summary of Mr. Morison's own description[2]: 1. Under an anæsthetic clean the skin. 2. Open the wound freely, and, if possible, sufficiently to permit of inspection of its cavity. Cleanse the cavity with dry sterile mops, Volkmann's spoon, &c., and remove all foreign bodies. 3. Mop the surrounding skin and the wound cavity with methylated spirit. 4. Rub B.I.P.P. into all parts of the wound with dry gauze, removing any excess.[3] 5. The wound is then stitched with deeply placed iodised silk sutures, and a large dressing of iodoform gauze and sterile wool bandaged on. The dressing is not removed for a fortnight. If there is much discharge the outer dressing may be removed and a clean pad applied.

Frequently when the dressing is taken off the discharges, sometimes evil-smelling, are found plastered all over the skin, producing a most unpleasant appearance. But when the discharge has been bathed away the wound is usually found to be to a large extent healed, a narrow strip of superficial granulations remaining to be dressed once in every five or six days.

It approaches the miraculous to see a limb pouring foul pus from a wound at the bottom of which lies a segment of humerus or of femur smashed into a multitude of spiculed fragments, and every attempt at dressing which causes the patient untold agony, bandaged (if it is an arm) to the chest wall or (if it is a femur) fixed in a Thomas's splint, and after having been left untouched for a fortnight uncovered and found to show only a superficial granulating wound from which commonly the 14 days' discharge has been less in amount than that of one day previously. Not only is there saving of nursing labour and of pain to the patient and the conversion of a compound into a simple fracture, but the healing of soft parts takes place without that terrible formation of contracting scar-tissue which, by compressing the nerves, produces so frequently a helplessly paralysed limb.

Compound fractures of short bones.—In cases of smashed tarsus or carpus the missile has often "mushed" up one or more bones. An X ray plate may show no obvious bone injury, but unhealthy granulations will soon pout from a relatively small skin wound, the hand or foot becomes painful and tender, there is some fever and more or less swelling of surrounding soft tissues. Under an anæsthetic the wound (or, if there are two, the uppermost one) is opened up, the pulped-up bony tissue is scraped away thoroughly, and the wound made as basin-shaped as possible, the skin wound being enlarged until it is larger than any transverse diameter of the hole in the bones. One or more Carrel's tubes are inserted, and the wound cavity is kept constantly filled with Dakin's solution. The hole quickly becomes lined with healthy granulations; in a comparatively short time the wound has closed in and healed over. The majority of the patients get moveable joints. I have seen almost normal function after removal of the astragalus and part of the os calcis.

Chronic necrosis with sinuses.—There remains to be considered the case in which a fracture of a long bone has united, but a sequestrum is locked up in the callus or some less definite area of necrosed bone keeps up the discharge of pus from one or more sinuses. The first case I treated by the Carrel method may be described as a typical example.

A man was admitted to the Bradford War Hospital at the end of 1916 suffering from a badly smashed femur. The wound was bipped and the fracture united, and the man was sent to an auxiliary hospital, walking on crutches. A sinus appeared and continued to discharge pus even after a fairly large sequestrum had been removed. At Sir B.G.A. Moynihan's suggestion an extensive operation was performed. A 10-inch incision was made in the line of the femur, through the old scar on the front of the thigh. The incision was carried down to and through the periosteum and the soft tissues were stripped back from the bone. All the bony irregularities about the seat of fracture were freely chiselled away until the exposed section of femur formed a smooth, regular floor of a large basin-like cavity capable of holding several ounces of fluid. A sequestrum 3 in. long was found encapsuled in the new bone and removed. The skin was stitched back on either side, so that the wound remained funnel-shaped. It was treated on Carrel lines, being filled up with Dakin's fluid every two hours. In this case no tubes were used: the limb was adjusted with pillows until the wound margins were level and the fluid was poured in every two hours to keep the "basin" full.

In less than three weeks the bacteriologist was able twice to report the wound surgically clean. Under ether the soft tissues were freed from the bone, a little B.I.P.P. scrubbed into the raw surface and thick silk sutures used to bring together the whole thickness of skin and muscles over the bone. The first dressing was done 14 days later and almost primary union found to have taken place. A fortnight later a linear scar remained and the soft tissues were moveable over a smooth bone surface.

Such results as these make one feel that a new era has arrived with regard to the treatment of infected wounds and that surgeons will never again allow wounds to go on suppurating, satisfied with doing nothing to induce them to heal beyond draining and dressing them.

In conclusion I have to thank Lieutenant-Colonel W. Wrangham for permission to describe the work done at the Bradford War Hospital.

[2] British Journal of Surgery, April, 1917. THE LANCET, 1916, ii., 268.

[3] B.I.P.P. is made as follows: Iodoform, 16 oz.; bismuth subnitrate, 8 oz.; liquid paraffin, 8 oz., or a sufficient quantity to make a firm paste. The powders are mixed together in a mortar and the paraffin incorporated.

STUDIES IN WOUND INFECTIONS.

ON THE GROWTH OF ANAEROBIC BACILLI IN FLUID MEDIA UNDER APPARENTLY AEROBIC CONDITIONS.

BY S. R. DOUGLAS, M.R.C.S., L.R.C.P. LOND.,
CAPTAIN, I.M.S. (RETIRED); FIRST ASSISTANT, BACTERIOLOGICAL DEPARTMENT, MEDICAL RESEARCH COMMITTEE, NATIONAL INSURANCE ACT;

A. FLEMING, M.B., B.S. LOND., F.R.C.S. ENG.,
ASSISTANT, BACTERIOLOGICAL DEPARTMENT, MEDICAL RESEARCH COMMITTEE;

AND

L. COLEBROOK, M.B., B.S. LOND.,
CAPTAIN, R.A.M.C. (T.); ASSISTANT, BACTERIOLOGICAL DEPARTMENT, MEDICAL RESEARCH COMMITTEE.

(*From Inoculation Department, St. Mary's Hospital.*)

IT has been known for some years that the addition of a piece of animal or vegetable tissue to any fluid media had a beneficial action on the growth of the anaerobic bacteria.

Tarozzi was the first to point out the advantage of such a procedure, the *sine qua non* of his method being the addition to the fluid media of a piece of animal tissue, usually kidney or testicle, taken as soon after the death of the animal as possible. This method, in spite of the trouble involved in obtaining such tissues perfectly sterile, was used extensively by Noguchi in isolating various forms of spirochætes.

Later, Ori and Wrzosek showed that the substitution of a piece of potato or other vegetable tissue for the animal tissues used by Tarozzi was followed by equally satisfactory results, and further, that sterilisation by heat did not interfere with the beneficial effect of such a procedure.

Wright and Dreyer, working in Boulogne, employed as a routine method for growing anaerobes tubes of broth to which a piece of potato had been added previous to sterilisation, and by such methods obtained abundant cultures of all the prevalent anaerobes isolated from wounds without taking any further precautions for obtaining anaerobic conditions; it was even found that growth occurred when a stream of oxygen was passed through the fluid portion of the media.

The usual explanation of such results has been that the animal or vegetable tissues contained some body capable of acting as a reducing agent. That living tissues, both animal and vegetable, act as reducing agents is a well-recognised fact, but it is unlikely that a small pellet of potato after being autoclaved should be able to bind all the oxygen which would be constantly absorbed from the surface of the media.

It was therefore decided to confirm some of the experiments that had been carried out by different workers and to try to ascertain if any other explanation could be found for these somewhat surprising results.

Experiments with Vegetable Tissues.

In order to confirm the results obtained by Wright and Dreyer showing that all the usual anaerobes found in wounds give an abundant culture when a small piece of potato or other vegetable is added to the broth before sterilisation, a number of broth tubes were taken, to each of which a small cube cut from a potato was added, after which they were sterilised in the autoclave. Into these a variety of anaerobic bacilli were planted, and the tubes were then incubated at 37° C. without any further precautions to produce anaerobic conditions. The tubes were examined for growth after intervals of 24 and 36 hours. The results are given in Table I.

TABLE I.

7	McFadzean VII.	,, ,,	,, ,,
8	Boone I.	A non-motile bacillus resembling *B. perfringens* except in its fermentation reaction.	,, ,,
9	Tholby IV.	Gram-negative bacillus with round terminal spore.	,, ,,
10	Tholby.	Bacillus resembling *B. tetani.*	,, ,,
11	Boone III.	Hibler IX. type.	Copious growth after 36 hours.

This table shows that the addition of a small piece of potato to the broth before sterilisation enables cultures of the anaerobic bacilli commonly found in wounds to proliferate rapidly in the absence of any further procedures to produce anaerobic conditions.

Further experiments showed that pieces of carrot, cabbage, grape were equally efficacious as potato. In addition to these substances flakes of bran were also employed, and an experiment was made in which different amounts of bran were added to the broth to ascertain if the growth varied with the amount of bran added. This experiment was carried out in the following manner: To a series of broth tubes, each containing 10 c.c. of broth, varying quantities of bran were added. After sterilisation in the autoclave each tube was planted with a loopful of broth culture of the bacillus of malignant œdema and then incubated at 37° C. without further precautions as regards anaerobic conditions. Examinations for the presence of growth were made at varying intervals. The results are shown in Table II.

TABLE II.

Amount of bran added.	Result after 18 hours.	Result after 36 hours.
1 flake.	No growth.	No growth.
4 flakes.	Slight growth.	Abundant growth.
10 flakes.	Good growth.	,, ,,
Many flakes.	Abundant growth.	,, ,,

This experiment shows that, up to a point, the more bran that was added the more copious and rapid was the growth. It may here be noted that of all the various substances which were employed in the experiments detailed in this paper to promote the growth of anaerobic bacilli in broth cultures, bran appeared to be the most efficacious.

Taking the result of these experiments into consideration, it was thought that some "foodstuff," such as vitamines, might have been given up to the broth by the vegetable substances added to it, which enabled the anaerobic bacilli to proliferate even when oxygen was present; in order to verify this, experiments were made to ascertain if anaerobic bacilli would grow in broth to which an alcoholic extract of bran had been added.

These experiments were carried out in several different ways. For instance, the alcoholic extract of bran was evaporated to dryness, and small portions of the substance thus obtained were added to the broth, or strips of sterile filter paper having been soaked in the alcoholic extract and then dried were placed in broth. Again, small quantities of the fluid alcoholic extract were added directly to the broth. These various samples of broth were then planted with anaerobic bacilli and incubated under ordinary aerobic conditions.

The results obtained by these experiments were conflicting. In some cases the broths containing the alcoholic extract gave abundant growths of the anaerobic bacilli, whereas control broth tubes gave no growth. In other cases, for instance, that experiment in which filter paper impregnated with the alcoholic extract had been added to the broth, growth appeared equally abundant in a control tube to which a piece of untreated filter paper had been added, as in those which contained the treated filter paper. It was also observed that growth occurred only in those tubes where a considerable mass of the solid alcoholic extract had been added or an extensive precipitate had been formed.

Experiments with Inert Substances.

Abandoning the idea that the growth of the anaerobic bacilli was due to the presence of any special "foodstuff," it was decided to carry out experiments to ascertain if growth would occur when various inert substances were substituted for the vegetable tissues.

In these experiments various porous substances, such as asbestos wool, cotton wool, lint, sponge, charcoal, chalk, cork, sand, cardboard, blotting-paper, khaki cloth, and, lastly, a rusty nail, were each added to a series of broth tubes, which were then autoclaved. Each series of tubes, together with a control tube of simple broth, were then planted with an equal quantity of an anaerobic bacillus and incubated under ordinary aerobic conditions. Examinations for the presence of growth were made after incubation had continued for 15, 18, 24, 36, and 48 hours. The results are given in Table III.

TABLE III.

Figures indicate the number of hours the tubes were incubated before growth appeared.

0 indicates no growth throughout the duration of the experiment.

– indicates that this special portion of the experiment was not carried out.

Bacillus planted.	Control tube of broth.	Substances added to broth.											
		Asbestos wool.	Cotton wool.	Lint.	Sponge.	Piece of charcoal.	Piece of chalk.	Piece of cork.	Sand.	Piece of card.	Piece of blotting paper.	Piece of khaki cloth.	Rusty nail.

Tholby IV.	0	36	36	36	36	36	24	36	36	24	0	24	—

These results show conclusively that any porous inert substance when added to broth renders this medium quite as suitable for the growth of anaerobic bacilli, without any further precautions as regards anaerobic conditions being taken, as the addition of pieces of potato or other vegetable matter. These facts can be most simply explained by assuming that the bacilli lodged in the meshes of the various substances are locally able to produce anaerobic conditions, in consequence of which they proliferate at first only in the interstices of the material, but later also in the surrounding media.

On studying this table more closely it is, however, to be noticed that none of the tubes containing pieces of blotting paper developed any growth; in these tubes the paper added consisted of a small unfolded slip of thin blotting paper. Again, it is noticeable that growth developed only in two out of the five tubes containing pieces of khaki cloth. Owing to the small amount of this material available only a very small piece could be added to each broth tube, and during the process of sterilisation the woollen strands became so unravelled that none of these tubes contained a close-meshed mass comparable to that seen in the tubes containing the asbestos wool.

From these observations it appeared probable that neither in the case of the pieces of unfolded blotting paper or of the minute pieces of unravelled khaki cloth were suitable interstices formed to enable the anaerobic bacilli to produce the conditions necessary for their growth. It was therefore decided to carry out a further series of experiments in which different amounts of asbestos wool were added to the broth

in order to ascertain if a closely packed mass of this material afforded more suitable conditions for the growth of the anaerobic bacilli than a smaller and more open-meshed piece of the same material. This experiment was carried out as follows:—

Two strains of anaerobic bacilli were taken, one of which had been demonstrated to be a very strict anaerobe, the other being capable of proliferating under less strict conditions of anaerobiosis. Each of these bacilli were then planted into two culture tubes, the one containing ordinary broth, the other broth to which a quantity of sterile asbestos wool had been added. The quantity of asbestos wool added to these tubes was varied. In the tube in which the strict anaerobe was planted a larger and more closely packed mass of this wool was placed than in the tube in which the bacillus capable of growing under less strict anaerobiosis was planted. These tubes were incubated without further anaerobic precautions and examined after 24 hours, when it was found that the strict anaerobe showed abundant growth with much gas formation, while the less strict anaerobe, having only the protection of a small and open-meshed piece of asbestos wool, gave only slight growth and very little gas formation.

This experiment shows that the amount and consistency of the inert substance added to the broth is an important factor in making the conditions suitable for the growth of anaerobic bacilli.

Experiments with Capillary Glass Tubes.

In order to test further the soundness of the theory put forward above—namely, that growth takes place at first in the interstices of the mass of inert material, an experiment was made in which a hair-fine capillary glass tube was placed in the broth. Such a hair-fine glass tube would represent in its simplest form a single interstice in a mass of asbestos wool, and if the theory put forward above was correct the growth should commence in this tube and only later spread to the surrounding media. A further advantage of such an experiment was that even in the finest capillary tube growth could be recognised by the formation of minute bubbles of gas. These experiments were carried out as follows:—

A series of broth tubes were taken and planted with anaerobic bacilli, each variety of bacillus being planted in equal quantity into two tubes. Into one of the tubes, in the case of each bacillus, a hair-fine glass capillary open at both ends was placed, the other tube being kept as a control. The tubes were then incubated and after varying intervals examined for growth. In the case of the control tubes no growth was ever noticed but in a certain proportion of those containing the hair-fine capillary tubes growth appeared after an interval varying from 24 to 48 hours. That this growth commenced inside the capillary tube was shown by the appearance of minute bubbles of gas inside the tube before any evidence of growth could be detected in the surrounding media.

That it was only a proportion of those cultures containing capillary tubes which gave growth can be explained by assuming that, as these tubes would only contain a fraction of a cubic millimetre, and that, as the anaerobic bacilli were not planted out very thickly, a proportion of the capillary tubes would not contain even a single living bacillus.

In Table IV. a series of successful experiments are given, which show that all the anaerobic bacilli commonly found in infected wounds are capable of growing in broth to which such a hair-fine capillary tube has been added without any further precautions being taken to produce anaerobic conditions.

Other Experiments: Summary of Results.

These results show that the growth of the anaerobic bacilli takes place at first inside the confined spaces; however, in order to show that anaerobic conditions were produced in the spaces, the following experiments were made.

Tubes of glucose broth were tinted with an aqueous solution of methylene blue, and a suitable mass of asbestos wool was then added. After sterilisation these tubes were planted with *B. perfringens* and incubated under the usual aerobic conditions. Rapid growth occurred, which was quite apparent after four hours, and it was noticed that the broth was completely decolourised in the immediate neighbourhood of the asbestos wool. On shaking the tube, however, the colour returned to its original density. This reduction and reproduction of the colour could be produced at intervals for several hours.

This experiment was repeated with broth coloured with sulphindigotate of soda with exactly similar results, and it was also found that some of the bacilli which were not very strict anaerobes were able to grow in this broth without any asbestos wool being added to it (especially when they were thickly planted), and that here also the decolourisation of the sulphindigotate took place at the bottom of the tube, where a large amount of bacilli were collected. It therefore seems certain that the anaerobic bacilli are either able to absorb oxygen rapidly or during their growth produce some very strong reducing substance which rapidly removes any oxygen that may be present.

Further experiments in which a similar technique was employed showed that during their growth the anaerobic bacilli were able to remove any oxygen from the culture media much more rapidly than many of the aerobic bacilli.

The above experiments show that the anaerobic bacilli are capable of proliferating freely in broth to which a piece of any inert porous substance has been added. The most convenient substance is a small pledget of asbestos wool, owing to the ease with which it can be sterilised by holding it in the flame of a Bunsen burner until it is red-hot.

These experiments also show that the growth takes place first in the interstices of the porous material; that in all probability anaerobic conditions are produced in these minute spaces; and that later the oxygen present in the surrounding broth is removed during the growth of the bacilli entangled in the porous mass.

Experiments with Substances under Anaerobic Conditions.

Lastly experiments were made to ascertain if a more rapid and more certain growth of the anaerobic bacilli could be obtained if in addition to the ordinary methods for obtaining anaerobic conditions a piece of inert porous substance was added to the broth into which the bacilli were planted. The details of these experiments are as follows:—

Experiment 1.—Six small test-tubes were taken and into each an equal quantity of sterile serum was placed, and each tube was then planted with an equal quantity of *B. perfringens* emulsion. Into three of these tubes a small compact pledget of asbestos wool was introduced, the other three tubes being kept as controls. After this all the six tubes were sealed with a layer of melted vaseline and incubated at 37° C. After three days' incubation it was found that no growth could be demonstrated in any of the three control tubes, whereas all the tubes containing the asbestos wool showed abundant growth. The absence of growth in the control tubes was probably due to the now widely recognised fact that *B. perfringens* will only proliferate in serum when the implantation is a heavy one.

Experiment 2.—A broth culture of the bacillus of malignant œdema was diluted by ten-fold steps to 1 in 1,000,000 dilution. Twenty c.mm. of each of these dilutions were then planted into tubes of: (i.) simple broth; (ii.) broth to which a small piece of potato had been added; (iii.) broth into which a pledget of asbestos wool had been placed. These tubes were then placed in the anaerobic apparatus described by McIntosh and Fildes and incubated at 37° C. The results obtained at the end of 24 and 48 hours are given in Table V.

TABLE V.

Media employed.	Result after 24 hours.	Result after 48 hours.
(i.) Broth.	No growth in any tube.	Growth in tubes planted with all dilutions up to 1 in 100,000.
(ii.) Broth + potato.	Growth in tube planted with culture diluted 1 in 10.	,, ,,
(iii.) Broth + asbestos wool.	Growth in tubes planted with culture diluted 1 in 10 and 1 in 100.	Growth in tubes planted with all dilutions up to 1 in 1,000,000.

These experiments demonstrate that anaerobic bacilli will grow both more rapidly and also from a smaller implantation when, *in addition to the usual anaerobic conditions*, some porous substance such as potato or asbestos wool is added to the culture medium.

AN UNUSUAL COMPLICATION OF LAPAROTOMY FOR GUNSHOT WOUND.

BY WILLIAM H. JOHNSTON, B.A., M.D., CH.B.,
CAPTAIN, ROYAL ARMY MEDICAL CORPS.

IN the following case of gunshot wound of the abdomen, with perforations of intestine, which were sutured, diffuse purulent peritonitis occurred as a complication, consequent upon rupture of an abscess in the anterior abdominal wall. Treatment by the Carrel-Dakin method was carried out, and resulted in recovery.

The patient, a soldier of a rifle regiment, aged 26, was hit in the abdomen by a rifle-bullet on April 4th, 1917. He was admitted by a field ambulance on the same day, where, after the administration of morphia, he was marked for urgent attention, and transferred immediately to a casualty clearing station. There also on the same day his abdomen was opened by a paramedian incision. Five holes in the small gut and two tears in the mesentery were sutured. No other injury was found, nor any foreign body. He had a mild peritonitis for 24 hours, but progressed satisfactorily.

Thirteen days later, on April 17th, the patient was transferred to a base hospital. On admission his condition was good, temperature being 97·6° F. and pulse 72. There was localised tenderness over the middle of the scar; otherwise the condition of the abdomen was excellent. He complained of a little pain referred to the area of the operation incision. There was no rigidity and the abdomen moved freely on respiration.

Suddenly, on the night of April 17th, about 10 P.M., he was seized with acute abdominal pain. He vomited frequently. His pulse rose to 120; his temperature at 6 A.M. on April 18th was 100°. On examination there was general tense rigidity, considerable tympanites, great tenderness, but no appreciable dullness in the flanks. At 8 A.M. he exhibited all the signs of a diffuse peritonitis; the vomiting continued, and his condition became critical.

Operation, 9 A.M., April 18th. The original incision was opened. An abscess cavity full of thick greenish yellow pus was found on the posterior sheath of the rectus, and extending between the divided muscle. This had tracked backwards and burst into the peritoneal cavity through the original line of incision. The abdomen contained some pints of a thin greenish, purulent, non-odorous fluid. There were lakes of lymph widely diffused upon the intensely congested bowel. From this fluid pure cultures of *Staphylococcus pyogenes*, a short-chained streptococcus, and *B. coli* were isolated.

The patient's condition was so grave that it precluded any extensive manipulation of the bowel. No perforations were found, nor was there any sign of the escape of intestinal or other visceral contents. After copious irrigation with Dakin's fluid four drains of ¼-inch tubing 2 inches long were inserted, one in each flank, into the right and left paracolic gutters, and one into each groin. (Figs. 1 and 2.) These were stitched in position, and through each a Carrel tube was introduced into the abdominal cavity, so that about 6 to 8 inches of the perforated tube lay inside the abdomen. The flank tubes were planted into the paracolic gutters. The groin tubes were allowed to lie free amongst the coils of bowel. In turn each Carrel tube was sutured to the wall of the outer large drainage-tube. The excess of Dakin's fluid was not mopped out from the pelvis. The original anterior incision was then closed by through-and-through silkworm-gut sutures, taking all structures at once. A small tube was introduced into the abscess cavity in the rectus sheath At the time of the operation the incision wound was not "Carrelled." The anæsthetic administered was warm open ether, and subcutaneous transfusion with saline (about 1½ pints) was carried out during the operation. On completion of the operation, which lasted about 25 minutes, the pulse was 150, and the temperature subnormal. The patient's condition was then very grave.

In the ward the patient was put in the Fowler position. Subsequently, irrigation, with ampoule and tubing connected up to each of the four small Carrel tubes, was carried out three-hourly for the first two days and four-hourly for the next four days. Thereafter the irrigation was gradually slackened off from six-hourly to eight-hourly flushings. The total quantity of Dakin's fluid used at each flushing was from about 50 to 80 c.c.

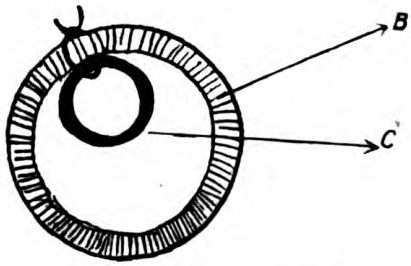
* First rise above normal after operation.

On the evening of the day of the operation the patient's temperature was subnormal and remained so until the evening of April 21st (three days). The change in pulse was remarkable (see table). It registered 96 on the morning after the operation and 112 in the evening. The temperature chart was equally striking. His first rise above normal after the operation occurred on the evening of April 21st, when his temperature reached 99°. The pulse rapidly fell to normal, regained its tone, and from the day after the operation ran steadily at about 72 to 88. From April 23rd he ran a slight evening rise of temperature (usually 99·2°) which continued for 24 days. During this time, in the mornings, the temperature was always normal. On May 16th his temperature remained steadily at normal and his pulse was then regularly about 76. Only on one occasion did the temperature rise above 100°—namely, on the evening of April 30th—when the pulse also rose to 104. The cause was obviously a localised collection of pus, which was not draining adequately through the laparotomy wound.



Dressings.—Patient was dressed twice daily for two weeks, and thereafter once daily. Owing to local infection from the abscess all the stitches had gradually to be removed from the laparotomy wound by the end of the third day. Pocketing occurred on both sides in the rectus sheath. Pockets were opened by sinus forceps and Carrel tubes were introduced into their furthest extremities. The abdominal parietes were strapped effectively with strips of 2-inch adhesive plaster applied in a laminated manner from behind the back, circling around the abdomen and crossing the laparotomy wound transversely, spaces being cut in the

FIG. 2.

Explanatory section on a larger scale.

adhesive to allow for drainings and the re-insertion of the Carrel tubes. These strips had to be reapplied once daily.

At each dressing the Carrel tubes leading inside the abdomen were gently twisted round and slightly withdrawn through the outer large drains. They were then fixed by safety-pins as before, and the Dakin fluid was then turned on through the connexions for a few seconds. It was observed that on doing this in the first half-dozen dressings a copious amount of pus was washed out through the large drains. By gently moving the Carrel tube the coagulum at the inner end of the large drain was dislodged, and any free exudate was then washed out by the fluid from the Carrel tube. Gradually each day the Carrel tubes were drawn out, until at the end of 18 days (May 6th) all four were removed and the four small drainage-wounds allowed to close.

Calomel, gr. 1/6, was administered six-hourly for two days. Thereafter the patient obtained a natural action of the bowels and only once had an attack of colic, due probably to an indiscretion of diet. On April 20th, two days after the operation, patient's blood was examined and the count showed as follows: Polymorphonuclears, 52·5; eosinophiles, 5·5; granular basophiles, 3 0; large hyalines, 12·0; and lymphocytes, 27·0 per cent. Leucocytes, 20,000.

Thirty-three days after the operation, having made an excellent recovery, patient proceeded to England.

Remarks.—To sum up, the case appears to us to present certain points of interest: 1. Patient had already, prior to the operation for generalised peritonitis, undergone a laparotomy for a gunshot wound, with suture of several holes in the gut and mesentery. 2. At the time of the second operation his condition was undoubtedly grave. 3. The bacteriological findings at the time of the second operation pointed to a virulent infection. 4. His leucocyte reaction determined on the second day after his second operation pointed to a strong resistance.

There is no doubt that the bursting of the abscess in the rectus sheath was the cause of the diffuse peritonitis. There may be room for doubt that the abscess was a suture abscess There is, however, little doubt that the infection *first developed* in the abdominal wall, originating either from within from contamination of the perforated gut, or from without from skin infection.

The ultimate excellent recovery, without for the moment considering Carrel-Dakin treatment, pointed to the fact that the first operation had been successful so far as repairing lesions in the gut was concerned. One is quite aware that even the worst cases of peritonitis sometimes go straight ahead after operation, but the clinical picture and the whole facts of the case point strongly to something more than coincidence here, and suggest the further investigation of the Carrel technique applied to the peritoneal cavity.

INOCULATION AGGLUTININS.

BY I. WALKER HALL, M.D. VICT.,

HONORARY CONSULTING PATHOLOGIST TO THE SECOND SOUTHERN GENERAL HOSPITAL; PROFESSOR OF PATHOLOGY, BRISTOL UNIVERSITY.

With the Assistance of

I. HILES, M.SC., AND F. NICHOLLS.

(*Report to the Medical Research Committee.*)

IN an earlier communication we recorded the agglutination titres observed in some individuals who had been inoculated previously with antityphoid vaccine. We also gave an account of the interaction of inoculation and infective agglutinins during the acute phases of paratyphoid fevers, and stated the results of concomitant absorption experiments which supported the views of Grattan, Wood, Harvey, Dreyer, and others, that the presence of infective paratyphoid agglutinins is associated with a tissue stimulation which brings about a rise in the agglutinins induced by the prior injection of killed typhoid bacilli.[1]

The advent of a number of convalescents who had been inoculated with the triple typhoid, para. A and para. B vaccine, afforded an opportunity for determinations of the extent and persistence of the inoculation agglutinins thereby occasioned and permitted an inquiry into their interaction.

The results now appended seem to suggest that the inoculation agglutinins which appear in the blood after the injection of dead typhoid, para. A and para. B bacilli tend to raise the titre for typhoid bacilli above that which follows when typhoid bacilli alone are employed, and that these titres are specific absorption titres and not due to co-agglutination.

Methods.—The methods throughout were precisely the same standardised procedures as those stated in our communication to the *Journal of the Royal Army Medical Corps* in September, 1916.

Inoculation Agglutinins for B. Typhosus *only.*

In 272 additional cases the single typhoid vaccine had been given and the results allowed comparison with similar findings in a further 77 cases inoculated before 1916, and another set of 268 cases examined in 1915–16 (Tables I. and III.). The figures in each lot are somewhat similar, although those for 1916 exhibit a larger number of negatives and a higher percentage of units over 650.

Inoculation Agglutinins for B. Typhosus *and* B. Paratyphosus A *and* B.

In Table II. the titres obtained from the blood of 310 convalescents are incorporated. These men had all been injected with the triple vaccine. It will be seen that the units for *B. typhosus* show a larger number of higher positives than those found when the single vaccine was injected (Tables I. and III.). The para. A and B units differ considerably, those of para. A being uniformly lower than the para. B, but in both instances the extent and persistence of the agglutinative capacity are greater than what we had been led to expect from previous animal and human experiments.[4 1]

The question, therefore, arises as to the respective parts played by the interacting stimuli emitted by the three types of bacterial protein. It is generally accepted that during infection, and also after inoculation with para. A bacilli, the agglutinin response is meagre and does not persist for a long period, while both typhoid and para. B infections and injections evoke a response in agglutinative capacity which is high and continued. The figures we now present, however, denote a considerable amount of agglutinin content for paratyphoid A and an apparently good immunity at the end of 12 months. Is this difference between the experimental infection and inoculation agglutinin and the specific inoculation agglutinin following injections of triple vaccine an expression of the group stimulation of the tissues by the action of the cleavage of dead typhoid or para. B bacilli, or due to some other factor? The answer to this query might confirm the practice of combining the three emulsions at one injection or point to the advantages of single and separate injections. We hope to bring forward some evidence bearing upon this problem in a later communication.

The Interaction of the Typhoid and Paratyphoid Agglutinins.

The response to the injection of single vaccines is said to be more rapid than that which follows inoculation with a mixed vaccine. This has been established by Castellani for typhoid and paratyphoid bacilli[2] and by Freeman for typhoid and cholera organisms.[3] But the extent of

immunity developed after two or more weeks is the same for single as for mixed emulsions. From the clinical standpoint, however, Coppinger and Gibson found that when the triple vaccine was used the reaction begins earlier and is more intense than when the single typhoid emulsion is injected.

During an acute attack of paratyphoid fever in a man previously inoculated with typhoid vaccine the inoculation typhoid titre is very frequently increased.[1] The figures we include in Table III. suggest that an increase in the inoculation typhoid titre occurs also in the presence of inoculation agglutinins induced by the injection of para. A and B bacilli. In 310 men in whose blood there appeared all the three agglutinins, and who had not been the subjects of typhoid-paratyphoidal infection, the typhoid units yielded a larger percentage of high units than were met with in 617 other men who had been inoculated with typhoid bacilli only.

Whether the typhoid agglutinin interacts similarly with the paratyphoid agglutinin production is a problem upon which we cannot offer any evidence at the moment, but the subject seems worthy of inquiry, and we have accordingly instituted experiments towards its elucidation.

Agglutinin Units following the Injection of Triple Vaccine in 356 Men.

The findings so far discussed relate chiefly to the interaction of agglutinins. There remains still the broader question of the general bulk results which have been yielded by sera obtained from men inoculated with the triple typhoid, para. A and B vaccine. Here we have considerable difficulty in presenting any complete survey, as it has not been possible always to obtain a precise account of the type of vaccine injected. Making use, however, of the general statement that the triple vaccine came into widespread employment in the early days of 1916, we have been able to present a rough account of the agglutination units determined. Had we been dealing with the acute phases of the diseases which caused the home-coming of the men, we should have found it more easy to place certain anomalous instances within definite categories. It was necessary to rely on experience and intuition in these cases to a greater extent than we care to do, but it seems worth while, perhaps, to attach Table IV. as a rough estimate of the success and failure of response to the triple vaccine. The negative findings are placed under the heading of "Less than 3" units of agglutinin, although the majority of these failed to give agglutination in dilutions of 1 in 10 serum. Speaking generally, the typhoid negatives are fewer than those met with after the injection of the single vaccine, while those following para. A and B are more numerous.

We thank Lieutenant-Colonel J. P. Bush, C.M.G., Lieutenant-Colonel J. Michell Clarke, and the whole of the staff of the Second Southern General Hospital, for the facilities they have so kindly provided.

Summary.

1. Additional observations upon the inoculation agglutinins following injection of killed typhoid bacilli are recorded. They confirm previous statements.

2. The agglutinin content after injection of the triple vaccine shows the response to be as persistent as when the single vaccine is employed. The units for paratyphoid A are the lowest, next comes paratyphoid B, and finally typhoid bacillus.

3. When compared with the results following inoculation with *B. typhosus* only the use of the triple vaccine is associated with an increased number of typhoid agglutinin units.

4. These findings in bulk confirm for man the observations which Dreyer and Ainley Walker record in their

experiments upon rabbits—namely, that after immunisation with dead *B. coli*, the subsequent injection of killed emulsions of *Staphylococcus aureus*, the bacillus of Friedländer, or a streptococcus increases the production of the specific primary agglutinins, so long as the animal retains any measurable degree of acquired immunity.[5] Perhaps the figures may be interpreted so as to carry the matter a little further and to suggest that inoculations with allied, or group, organisms point to the probability that typhoid and paratyphoid bacilli differ so much in their essential metabolism as to classify them individually as heterologous organisms. The results of our previous absorption experiments and their inferences as to the absence of co-agglutinins in sera containing mixed antibodies lend support to the surmise.[1]

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

A CASE OF VINCENT'S INFECTION INVOLVING MOUTH, EYES, AND PENIS.

BY F. B. BOWMAN, M.B. TOR.,
MAJOR, C.A.M.C.; O.C. NO. 2 CANADIAN MOBILE LABORATORY.

SINCE publishing a preliminary report on "Infectious Stomatitis among Troops" in 1916[1] many cases of this serious condition have been seen. That cited here would seem to be of sufficient interest to warrant an individual report.

Case history.—Captain ——, aged 30. Always had good health until the present illness occurred. About March 1st, 1917, he noticed that he began to lose his voice. He does not describe any pain in connexion with this, but it seemed to be due to a sense of constriction in the throat. The glands in the neck were not tender. The condition gradually became worse, and on March 15th, when instructing a party in trench work at night, he had a severe chill and a cough developed. He then noticed soreness of the eyes with watering, and had great tenderness of the gums. On March 19th he was admitted to hospital.

Examination on admission.—Temperature 102° F. Greatly depressed, feels chilly, and can eat nothing but fluids because of the soreness of the lips and inside of the mouth. He was seen by me on March 21st. Examination showed a very severe conjunctivitis, with a large amount of thin discharge present containing flakes of whitish material; the conjunctivæ were red, a certain amount of photophobia present. The mouth was half opened and the lips covered with angry herpetic-looking ulcers, some of which were covered with a fragile whitish membrane. These seemed to be confined to the lips, and had not extended to the surrounding skin. On account of the pain it was impossible to open the mouth, and it was very difficult to retract the lips. The gums were reddened, the teeth bathed in pus, and pressure on the gums caused severe bleeding. The hard palate was covered by a whitish membrane, which came away easily, leaving a bleeding surface. The throat, which could be seen only partially, was covered with a membrane also, but there was no evidence of any deep ulceration. Smears were made from the eyes and from the ulcerated areas in the mouth, as well as from the gums. These showed large numbers of Vincent's organisms (spirochætæ and fusiform bacilli).

A mixture of arsenic and ipecac., as recommended in a previous paper, was used three times daily as an application to the gums and lips, and also as a mouth wash. Boracic compresses were advised for the eyes. In 24 hours the mouth felt "easier," although it was impossible to open the lips. After three days from the time that I had first examined him the patient confided in me that he had a peculiar sore on the penis, and this on examination was found to be a small red ulcer with a membrane over it surrounding the meatus. Smears showed Vincent's organisms present in large numbers. For treatment the same solution as that used in the mouth was applied on a small pad of cotton-wool, and changed three or four times a day. The ulcerated area was completely healed within a week. The Wassermann reaction was negative on two occasions. During the second week after admission the patient developed a severe pleuritis, with a fairly large amount of fluid present; but this apparently was simply coincident, and had no relation to the other conditions described here, although the chill and cough, which developed early in the disease, were the first signs of pleuritis.

When last seen by me the mouth, eyes, and penis were entirely healed, and the marked depression which was present at first had disappeared. This was one month after his admission to the hospital.

Summary.—The case reported here is particularly interesting from the fact that three separate and distinct areas covered by mucous membrane were infected by Vincent's organisms. The primary infection was probably in the mouth and had been transferred to the glans penis and conjunctivæ by means of the fingers. Treatment with the following prescription as a mouth wash, with directions that the mixture should not be swallowed, quickly cleared up the condition:—

℞ Vin. ipecacuanhæ ... ... ℥ ss.
Glycerini ... ... ℥ j.
Liq. arsenicalis ... ... ad ℥ j.

ANOTHER CASE OF MALARIA CONTRACTED IN ENGLAND.

BY R. LOY WILCOX, M.R.C.S., L.R.C.P. LOND.,
SENIOR ASSISTANT MEDICAL OFFICER, PARK HOSPITAL, LEWISHAM, S.E.

G. T., aged 20 years, had an abdominal operation at Salonica for wounds received in action on Nov. 28th, 1916, but has been in this country for over three months. He was admitted to the Park Hospital certified to be suffering from scarlet fever on July 27th, with the history of vomiting and sore-throat on the previous day.

On admission he had a faint punctate erythema, the tongue was heavily furred, and the fauces were swollen and injected. The temperature was 104°F., but there was no rigor. The temperature continued irregular and at midnight July 30th-31st was 104°, but again there was no rigor. It was normal on the morning of July 31st and remained normal until 7.15 P.M. on August 1st, when the first rigor occurred, the temperature rising to 104°. By midnight it was normal again. A careful examination of heart and lungs revealed nothing abnormal.

On August 3rd, at 2.30 P.M., he awoke from his sleep and asked for a hot drink, as he thought an attack was coming on. A rigor followed immediately, and then malaria was thought to be the cause of the trouble, and the man, who had previously been taking sodium salicylate, was put on quinine sulphate 3 gr. every four hours. Another rigor occurred on the 5th, and the dose of quinine was increased to 6 gr. every four hours. Afterwards there were no more rigors and the man rapidly became convalescent. On the 9th the dose of quinine was reduced to 3 gr. every four hours, and on the 13th it was omitted altogether. A blood film taken during the height of an attack was kindly examined by the pathologist of the military hospital from which the man came and he reported that the tertian parasite was present.

The rash present on admission disappeared in a day or two and as neither the tongue showed any trace of peeling at any time nor was any desquamation seen the diagnosis of scarlet fever was abandoned and the man discharged well on August 21st.

I am indebted to Dr. T. F. Ricketts, medical superintendent, for permission to publish this case.

THE Local Government Board has approved of the appointment by the Bournemouth town council of Mr. William Bertram Lawrence as tuberculosis officer for the period of the war, subject to his services not being further required by the War Office.

MEMORIAL BED TO THE LATE MR. JOHN PLATTS.—As a memorial to the late Mr. John Platts his sister and legatee, Mrs. M. A. Shipley, has endowed a bed in the wards of the Leicester Royal Infirmary. Mr. Platts was a well-known representative of the firm of Messrs. Southall Brothers and Barclay, manufacturing chemists, Birmingham, and for many years was closely associated with medical work in the neighbourhood of the hospital. This fact is recorded on a memorial plate over the bed.

Reviews and Notices of Books.

The Thyroid Gland in Health and Disease. By ROBERT MCCARRISON, M.D. R.U.I., D.Sc. Belf., F.R.C.P. Lond., Major, Indian Medical Service; Lauréat de l'Académie de Médecine, Paris. With numerous illustrations. London: Baillière, Tindall, and Cox. 1917. Pp. 286. Price 12*s.* 6*d.* net.

FROM the time of Hippocrates and Aristotle onwards impure drinking water has been held by the majority of physicians to be the cause of goitre. But it is only within comparatively recent years that we have approached a precise knowledge of the ultimate causes of disease of the thyroid-parathyroid glands by the correlation of facts and inferences based upon the results of experiments upon animals, clinico-anatomical observations upon man, and epidemiological investigations. It is a great satisfaction to recall the fact that many British physicians and physiologists have acted as pioneers in important contributions to our knowledge of the thyroid gland in health and disease, and we welcome this latest valuable pioneer work of Major McCarrison, which sets forth in a lucid, comprehensive, and interesting manner a subject which he has studied experimentally, epidemiologically, and by clinico-anatomical observations for the past 14 years. During this time he has contributed numerous original papers to medical journals and societies, including the Proceedings of the Royal Society, bearing upon goitre and allied subjects. Major McCarrison speaks authoritatively as a physician of experience, and throughout all three parts into which the work is divided there is exhibited a most extensive knowledge of the literature.

The first section deals with the thyroid and parathyroid glands in health; the second with the factors which cause them to depart from health; and the third with the morbid states of goitre and cretinism, tetany, myxœdema, and exophthalmic goitre. In the appendix there are two series of cases showing the effects of intestinal antiseptics on goitre, as well as a brief summary of the author's more noteworthy epidemiological and experimental observations.

In reviewing this important contribution to medical literature we shall best serve the interest of the profession by briefly referring to Major McCarrison's conclusions regarding the causation, prevention, and treatment of endemic goitre, a subject of great importance, seeing that "in India at the present time there are not less than five million persons afflicted with goitre, while half a million is a low estimate of the number who suffer from its congenital manifestations." It was generally believed that permanent hardness of the water was the cause of goitre—e.g., Derbyshire neck was attributed to this; while not denying that it may be to some extent a contributory factor, Major McCarrison's observations show that it is not an essential cause. Within recent years the many theories as to the causation of endemic goitre have been reduced to the following: (1) Chemical ingredients of drinking water; (2) geological peculiarities of the soil, imparting to the soil a specific colloidal poison; (3) faulty nutrition; (4) living micro-organisms. The author claims that his experimental and epidemiological observations prove that living organisms are the essential cause of the disease, and he puts forward the following premises as proof that fæcal contamination of the water-supply by a living and specific micro-organism is the cause of goitre. 1. In villages where goitre prevails this disease shows a steady increase in proportion to those conditions which increase the impurity of the water by fæcal contamination. 2. He claims to have produced goitre experimentally in man by ingestion of the residue left on the candle of a Berkefeld filter after filtration of goitrigenous water. This residue when boiled does not cause goitre. 3. The administration of beta naphthol and thymol and other intestinal antiseptics may cause the disappearance of the goitre in young subjects. 4. The researches on trout by Marine, Lenhard, and Gaylard demonstrate that fish confined in tanks one above the other on a single water-supply exhibit an increasing thyroid hyperplasia in the series from above down. 5. He claims to have produced goitre in rats and goats by feeding them on fæcal material from goitrous and even non-goitrous subjects; also from cultures, aerobic and anaerobic. The anaerobic are the more potent. 6. Congenital goitre with cretinism and parathyroid disease can be produced experimentally by feeding the mothers throughout pregnancy with these cultures. Photographs of men and animals and photomicrographs of sections of the glands are given. Finally, Major McCarrison claims that vaccines prepared from intestinal organisms are capable of causing the disappearance of recent cases of goitre when injected in appropriate doses at weekly intervals. We are of opinion, however, that further observations will have to be made before the value of autogenous vaccines in the treatment of goitre can be accepted as proven. With regard to the infective organism, Major McCarrison claims that it lives in the soil of infected localities, and particularly in soil which contains a high proportion of organic matter of human or animal origin. It seems that "the great source of the disease is the infected individual, and that he is the producer, the reservoir, and the distributor or 'carrier' of the infecting agents." The author, therefore, implies that there is a specific organism capable of producing goitre, which exists in man living in districts where goitre is endemic. This organism has not been isolated and obtained in pure culture; in fact, the observations on trout would seem to point to the fact that normal organisms of the fæces passing through the intestinal canal of this fish acquire an increased toxic influence on the thyroid gland. In the author's experiments on rats he states that ingestion of fæcal material from even non-goitrous subjects will produce goitre, which rather militates against his experiments, proving that there is a specific goitrigenous infective organism. Major McCarrison has shown that in mountain villages where one is situated above another there is a correlation between the increase of fæcal contamination of the water-supply and the prevalence of goitre. Might it not be worth while to make plate cultures and counts of the different fæcal organisms in the water-supply of a series of such villages? It would also be of interest to ascertain whether there was any modification, morphological or cultural, in the organisms found in the water-supply to the villages where goitre is most prevalent.

It is interesting to note that the author does not consider that Graves's disease is the direct outcome of the flooding of the organism with thyroid substance, as it is stated to be by Biedl. According to Major McCarrison, it is not the escape of excess of the thyroid secretion which is at fault, but a bacterial toxin which stimulates the gland to increased activity. The remedy, therefore, is to seek the source of the bacterial toxin and eliminate it. He enters a protest against the tendency of some surgeons to operate in all early cases as a routine procedure.

We can cordially commend this valuable work, so rich in original thought and observation. Naturally all the links of the chain of evidence upon which our present knowledge of thyroid-parathyroid disease is founded are not of equal strength and probable durability. Some of the links contributed by the author will require strengthening by further investigation and by confirmation of independent observers.

The book is interesting in style and lucid in exposition, is well printed and illustrated. We congratulate the author on having made a noteworthy contribution to British medicine.

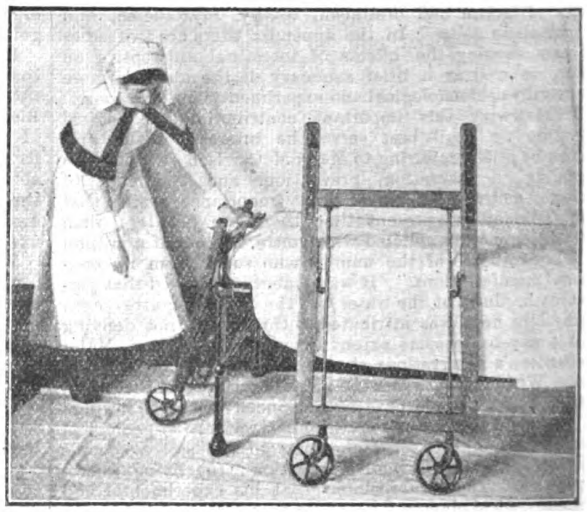
LIBRARY TABLE.

Daily Drill for the Voice. By ROSE I. PATRY. Published by the author at 3, Lower Seymour-street, Portman-square, London, W.—In this pamphlet on voice management Miss Patry has done a sound and useful piece of work. The want of skilled attention for sufferers from shell-shock has been keenly felt by those coming in contact with them. There is not only the need for medical help, but for help from persons skilled in voice-production and voice-correction. There are difficulties in the way of supplying the latter kind of assistance to many of the victims who require it most, and the possibility of helping themselves, as indicated in "Daily Drill for the Voice," will be most useful information. The book contains six groups of exercises for control of breath, voice, and body, graded with obvious precision. Exercises in regular control of the breath and in use of the voice are combined with movements of the arms, ribs, chest, and with such ordinary movements as writing, walking, rising from a seat, so that the recovered or corrected voice is from the first placed in the circumstances of

daily life. Care, too, has been given to the amount of mental effort required in performing the exercises, the early ones being more mechanical than the late ones. One point that might offer some difficulty to the inexperienced reader is the exact meaning of "the initial sound" of a consonant. A list of the phonetic sounds as used in the pamphlet might with advantage have been added to the introductory directions and so have removed any doubt on the part of the learner. Thus we should have had explained such an exercise as "Make the shape of the mouth of the following consonants ..... W, W, W. ....." To the uninitiated what is the shape of the mouth for "W"? The pamphlet contains no exercises dealing with such sounds as "th," "sh," "ch," "j," or difficult combinations, e.g., "pl," "gr," "st," "sk," which leads us to suggest that Miss Patry should produce a sequel in the shape of a series of exercises of a higher standard of difficulty. Meanwhile any soldier or sailor whose speech is affected may derive invaluable benefit by using "Daily Drill for the Voice."

A Farmer in Serbia. By ELLEN CHIVERS DAVIES. London: Methuen and Co. 1917. Pp. 248. Price 6*s.* net.—This is a very readable book, composed to some extent of articles which have been contributed to the *Manchester Guardian*, the *Morning Post*, and the *Yorkshire Post* enlarged into a diary, bearing dates from the first summer of the war until the time when Bulgarian defection led to the over-running of Serbia by the enemy. The book tells an interesting and pathetic story simply but quite poetically. It is easy to realise the beauty of the scenes in which many of the struggles were enacted, as well as to comprehend what a horrible tragedy it was that the Allies were unable to make good the Serbian resistance. The proceeds of the sale of the book will be given to the Serbian Relief Fund.

Health Survey of New Haven. Yale University Press, New Haven, Connecticut. 1917. Pp. 144. Price 75 cents net.—This Survey was prepared at the request of the Civic Federation of New Haven and is now published in pamphlet form by Yale University, the cost being defrayed from the Anna M. R. Lauder Memorial Foundation in the Yale School of Medicine. The record of an exhaustive sanitary survey is extremely practical, and each description of existing positions is followed by a definite recommendation where a method of reform has suggested itself to the authors. The one essential need made clear by their investigations is that of providing the health department of the city with six efficient and well-qualified divisional directors, who could supervise the work of their subordinates and aid the health officer in the organisation and development of particular lines of energy. The expansions of the work of the department of health which appear cardinally essential to the authors include the re-arrangement of the work of the Board of Health, the strengthening of the various staffs with a more reasonable division of their labours, the reorganisation of school inspection with the provision of school clinics, and the appointment of an expert on tuberculosis to develop a campaign against the disease. The cost of the suggested additions are estimated at about £7000 a year, an increase of per capita expenditure for health work in the city from 26 to 48 cents annually. This strikes us as being a remarkably moderate figure. The public health authorities of English cities having a comparable population of something between 100,000 and 150,000 might with advantage study this well-arranged pamphlet. All the modern problems of preventive medicine receive notice, and in many places there are indications for reform which would be as applicable in a British as in an American city.



Manual of Chemistry. By W. SIMON, Ph.D., M.D., and DANIEL BASE, Ph.D. Eleventh edition, thoroughly revised. London: Baillière, Tindall, and Cox. 1917. Pp. xvi. + 648. Price 18*s.* net.—In the preparation of this edition the chief change made has been the omission of the chapters on light and electricity of the previous editions, though the articles on the spectroscope and the polariscope have been retained, since their applications in analytical work are indispensable. This course has made room for much new matter, particularly in the first subdivision of Section II. dealing with the non-metals. In this section some space is given to an account of reversible reactions and chemical equilibrium. In previous notices of this book we have always expressed an appreciation of its clearness of statement, its logical sequence of facts, its remarkable coloured illustrations of tests, and its general soundness on both theoretical and practical questions. The student in the laboratory will find this book of considerable service, even though he be a beginner.

A Laboratory Manual of Organic Chemistry for Medical Students. By MATHEW STEEL, Ph.D. New York: John Wiley and Sons, Inc. London: Chapman and Hall, Limited. 1916. Price 6*s.* net. Pp. 193.—A useful series of tests is here given for more or less familiar organic substances, setting forth their properties as well as those reactions which serve for their detection. Particular attention has been given to the selection of experiments which are of special interest to medical students. The sections on alkaloids, proteins, amines, and amides are the best examples of this plan. In the directions given in making the tests the use of definite quantities of reagents is enjoined, which has the double advantage of obviating waste of material, and of securing a satisfactory response to the test. The book presents a sound practical course of laboratory teaching confined to organic substances.

New Inventions.

THE "TOWNSEND-LOCK" BED LIFT AND TRANSPORTER.

RECENTLY we noticed two devices for moving the sick and their beds. We here describe a bed lift and transporter which is the invention of two members of the Inquiry Bureau of the 2nd Southern General and Beaufort War Hospitals, Bristol, and their Auxiliaries. The apparatus is simple, light, strong, and effective, and affords a ready means of wheeling a patient in bed, without any jarring or discomfort,

into the open air, even over grass or uneven ground. As will be seen from the illustration, the invention consists of two square frames (one for the head and one for the foot of the bed) running on swivelled rubber-tyred wheels. The frames are hooked under the top bar of the bed which is levered up by pushing forward the bottom of the frame. The frame is then clamped securely in position by hooks sliding on its face. No lifting is required, the leverage being equal to any normal load on the bed, and the adjustments can be made in about 15 seconds. The apparatus is adjustable, and can be fitted to almost any ordinary hospital bed.

Any proceeds resulting from the commercial use of this invention, which is priced at £4 10*s.*, will be devoted to the funds of the Inquiry Bureau. Only one set of frames is required for any number of beds.

Further details may be obtained from the Honorary Secretary, Inquiry Bureau, 39, Broad-street, Bristol.

At The Front—

Since the beginning of the war tens of thousands of packages of

have been used in the Hospitals of France alone.

Physicians and surgeons in His Majesty's service on duty in France should bear in mind that Antiphlogistine obtained from our Paris Laboratory, No. 116 Rue de la Convention, is composed of the same C.P. ingredients and compounded according to the same formula as the British Antiphlogistine, made at No. 41 St. Ann's Road, Bow, London, E. 3.

THE DENVER CHEMICAL MFG. COMPANY

BOW, LONDON, E. 3.

THE TREATMENT OF VENEREAL DISEASES.

Recurrent Fever
SYPHILIS

GALYL

Framboesia
Sleeping Sickness

GALYL is as effective as SALVARSAN or NEOSALVARSAN on Spirochætes and Trypanosomes, more rapid in action, and free from the neurotropic and congestive action of these preparations.

FOR INTRAVENOUS INJECTIONS:—
(Fig. 1)

(1) **DILUTE.**—GALYL is supplied in neutral glass ampoules containing the necessary dose of Sodium Carbonate, sterile distilled water only being used for the dissolution.

(2) **CONCENTRATED.**—A special outfit containing one dose GALYL, one ampoule sterilised solution, and one small filter is supplied.

DOSES.
0·20—0·25—0·30—0·35—0·40.

(3) FOR INTRAMUSCULAR INJECTIONS:—
(Fig. 2)

GALYL is supplied in **GLUCOSE SOLUTION.**

DOSES.
0·10—0·15—0·20—0·30.

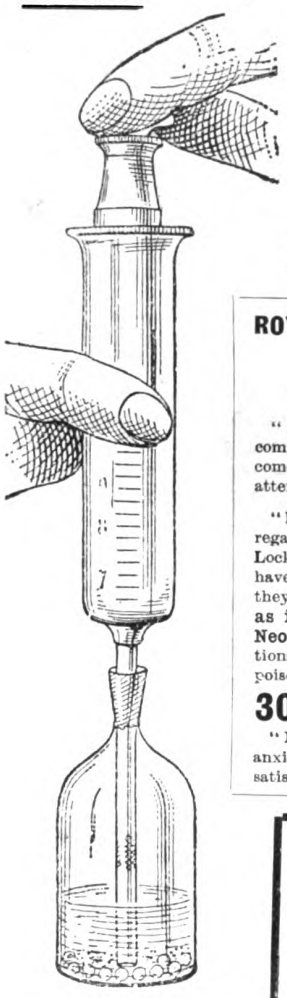


Fig. 1.

ROYAL COMMISSION ON VENEREAL DISEASES.

Final Report of the Commissioners.

SUBSTITUTES FOR SALVARSAN.

"..... another French substitute, **GALYL**, a compound of arsenic and phosphorus, has recently come into prominence, and its use has been attended with considerable success."

"Favourable reports have also been obtained regarding the preparation **GALYL**. At the Male Lock Hospital 1000 injections of this substance have been administered, and it is reported that they have been attended with **as good results as in the cases treated by Salvarsan and Neosalvarsan**; in no instance were the injections followed by reactions indicative of arsenic poisoning."

3000 injections (intravenous) were given in one of our **Service Hospitals.**

"No case has given the slightest cause for anxiety, and the clinical results are very satisfactory." *Staff Surgeon's Report.*

THE NEW INTRAMUSCULAR GALYL.

The GALYL is in the form of a Sodium Salt in a weak solution of glucose. This is much easier to use and more rapidly absorbed than the oily emulsion. It is in every way identical with the intravenous—efficacy, dose, price, &c., only differing in administration.

"The results are excellent, both immediate in the clearing up of evident lesions and ultimate, as proved by the Wassermann test. Personally I have used this preparation in over 400 injections with the best results and without the slightest mishap or inconvenience to the patient.

"Yours faithfully, Dr. ——."

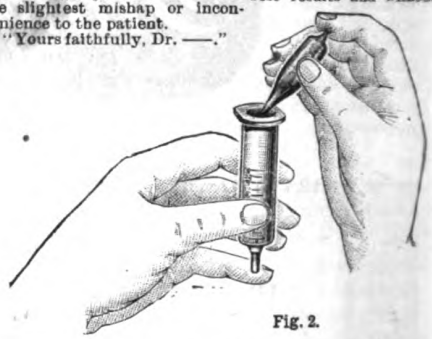

Fig. 2.

The technique is simple

Fig. 2 shows the ampoule of Galyl being emptied into the syringe barrel—the needle is now fixed on the neck of the syringe and the plunger inserted into the barrel. The injection is then ready for administration.

HECTARGYRE

(Mercurial Salt of Hectine)

ARSENIO-MERCURIAL TREATMENT

Hectine is a soluble Arsenical derivative with an extremely low toxicity; and combined with mercury is well tolerated even where prolonged treatment is necessary, such as severe cases of intractable Syphilis, in which it has yielded highly.

FURTHER LITERATURE ON REQUEST.

ARSENIO-MERCURIAL TREATMENT

SATISFACTORY CLINICAL RESULTS.

As a treatment following GALYL, or ab initio in all stages of the disease: Hectargyre is very effective and rapid. The injections give little or no pain.

FOR INTERNAL ADMINISTRATION.

Hectargyre Pills.
Hectargyre Drops.

The Treatment of Wounds in War.

Professor W. W. KEEN has not been at the front, but in his eightieth year he is a surgeon of large experience and breadth of view, and his report[1] on the treatment of war wounds, compiled at the request of the National Research Council of America, will be studied with profit by many whose daily work brings them in contact with the wounds of war and with the controversies thereon arising. The Atlantic, while reducing magnification, may at the same time improve perspective. After three years of fighting the number of different methods of treating wounds is still so great as to prove that there can be no one preferable technique, and this would be expected when we remember the diversity of circumstances and environment in which the injuries are inflicted. General principles may evolve, though a one and only procedure need not be expected. But many of the new remedies brought forward during the war have been acclaimed by their inventors as almost a panacea for all sorts and conditions of wounds, and that there is no small amount of truth in many of the claims that are made proves simply that in dealing with an enormous mass of wounded material large groups having similar manifestations have been found. Various new conditions have been met with, and the new lines of treatment have been devised for the most part to deal with these new conditions. The sepsis seen in many of the wounds in the present war is of a virulence rarely if ever encountered in civil practice and almost unknown in previous campaigns. Gas gangrene and tetanus were rife in the early months of the war. The long interval between the infliction of the injury and even the first dressing, which in some sections of the line was bound to occur, led only too often to the penetration of microbes deeply into the wounds; and when close trench war prevailed everywhere great difficulties were experienced in bringing in the wounded. But now that the movement on the western front, which we are considering to-day, is towards the east always, so that the ground over which the advance is being made remains in our hands, the wounded receive aid much earlier than was formerly the case, and some of the older problems have disappeared.

The skill and inventiveness of the army surgeons, their civil colleagues, and the pathologists have been exercised to the utmost, and the results of treatment have steadily improved. Tetanus has almost disappeared; every wounded man receives one or more doses of antitetanic serum as a matter of routine, and the effect is intensely striking to all workers in military hospitals. The treatment of gas gangrene presented what our American allies would term "a tough proposition." Various methods were proposed and tried, but until recently—sad to think!—the safest treatment too often was to perform a flapless amputation, so that the perfect drainage and the exposure of the anaerobic organism to the air led to its elimination. Now the claim has been made for a new serum that it will deal as effectively with gas gangene as the tetanus antitoxin deals with tetanus. If this claim should prove well founded, a valuable addition will have been made to our armamentarium, and we hope that further work in this direction may clear up all the doubts. For the treatment of wounds infected with the ordinary pyogenic organisms many procedures have been devised. One of the most valuable methods of lessening the sepsis, and one which often permits of healing by first intention, is excision of the wound so that a large proportion of the entrant micro-organisms is mechanically removed; while the tissues damaged by the toxins are taken away, and clean healthy tissues are brought together. Even though a true union by first intention may not always be obtained, yet the suppurative process is immensely weakened, and healing is promoted. The whole work of Sir ALMROTH WRIGHT in these directions has tended towards simplification and towards a scientific comprehension of the underlying pathology of the conditions met with. For the treatment of wounds which have already become infected, but cannot from their extent be excised, Sir ALMROTH WRIGHT'S researches have been invaluable, while two methods have emerged to which the authors' names have been properly attached. CARREL'S method of using Dakin's hypochlorite solution, and RUTHERFORD MORISON'S employment of "B.I.P.P.," although differing widely in the means employed, are both undoubtedly effective in preventing and reducing sepsis in wounds, and each has proved useful in promoting their healing. By the Carrel method it is claimed that in nearly all cases of wounds in which the infection has not progressed too far it is possible by the regular instillation of the hypochlorite solution to render the wound germ-free within a week or two, and the asepsis is guaranteed by a bacteriological test; and when this aseptic stage is reached the wound may be sutured and it will heal without suppuration. The Carrel method is the only one described in detail by Professor KEEN, as, judging by published statements, he finds the results superior to those of any other method. The work of Dr. A. DEPAGE on compound fractures at La Panne has specially impressed him. The "B.I.P.P." treatment consists in filling the wound with a paste of bismuth subnitrate, iodoform, and paraffin, and when it is closed with sutures in many cases the wound heals rapidly with a minimum of suppuration.

In the present issue of THE LANCET appears a paper by Major JAMES PHILLIPS, R.A.M.C., who has worked at the Bradford War Hospital, and from a study of the various forms of treatment he has evolved the "Bradford method," with which he has

[1] The Treatment of War Wounds, by W. W. Keen, M.D., LL.D., Emeritus Professor of Surgery, Jefferson Medical College, Philadelphia. W. B. Saunders Company, 1917. Price $1.75.

obtained excellent results. It is essentially a combination of these two methods, the Rutherford Morison and the Carrel treatment, preference being given to the one or the other according to the lesion, and sometimes the two are employed in turn. Success depends not only on the actual method itself, but also on the application, and this is why the inventor of a new method may obtain results superior to those of others. If a surgeon is working on lines in which he does not believe, it is unlikely that he will meet with success; he does not carry out instructions with the care and thoroughness that he would use if he believed absolutely. Little details vital to success will be omitted or imperfectly carried out, and the method will be dismissed as of little or no value. At the first introduction of antiseptic surgery surgeons who did not believe in it condemned it as useless, "for," said they, "we have used carbolic acid in the wound and pus was formed as usual," forgetting or ignoring that the principle of antiseptic surgery is not merely the employment of carbolic acid. There is no finality in surgery, and we certainly have not reached any finality in the treatment of wounds in war; but it is certain that in the past three years we have learned much of the treatment of these wounds, we have been able to save life and to prevent much pain and delayed healing.

Air-Raid Psychology and Air-Raid Perils.

IN certain schools of biological thought, as we had occasion to point out when discussing the subject of air-raid psychology a few weeks ago, a favourite theme is the adaptation of the organism to repeated sense stimuli of a given type, whereby appropriate reflex action by way of defence or otherwise is installed. Now the aerial bombardment of crowded cities is a recent development of "civilised" warfare; our sense organs have not in any general manner become adapted to the stimuli, with the result that, among the population taken in mass, definite defensive behaviour has not been evolved as a normal course. But although it would be too much to expect that in so short an experience of aerial bombardment the public conduct should have devised at once the wisest courses of action in circumstances which are not only very trying in themselves but very diverse in their dangers, yet it may be claimed that in London and its environs the inhabitants have already gone a long way towards behaving in bulk with bravery and prudence. It is a truism that a crowd is impulsive and mobile, but their common impulse and consequent movement, when properly directed, spread rapidly, grow wiser and stronger as they spread, and tend to shape the behaviour of the more unstable members with a force that is augmented by geometrical progression. London behaved well at the beginning in face of the new perils, and the beginning is being justified by the sequel.

London during last week endured five aerial raids of varying severity, and each of those raids had as furious an intent as any of the others. During this week, as we write, London has been the objective during two nights of similar exhibitions of frightfulness, and there is not a doubt that the immense populations involved have learned with speed and uniformity lessons which have saved many lives, which will save more lives, and which—this is of infinite importance—have enabled them to analyse their dangers, estimate the severity of those dangers, and front them therefore with that spirit of comprehension which is the basis of fortitude. The experiences of London happen to be our text, but they exemplify, of course, the experiences of all centres of aerial attack. At the present moment London is to the enemy the symbol of our national might and its inflexible resolves, and is, therefore, the object of their most determined onslaughts; but lessons learnt from events in London are applicable throughout the zone of war. The people of London, including those of the densely-populated rings without London proper, now appreciate that their risks can be divided into two—namely, those from the bombs of the enemy and those from the defensive gun-fire; and they know, further, that by as much as the hideous din and luridly magnificent atmospheric effects constitute the most terrifying stimuli to their senses, by so much is fear misplaced, because it is the work of our defensive machinery, as the enemy in vain tries to penetrate, which accounts for nearly all which they can hear or see. The Home Office has drawn up a leaflet containing a summary of the advice which has been given so far to the public, with the additions and modifications which events appear to justify. An intelligent reading of this leaflet proves how small are the risks to which the bulk of the population is submitted from the supreme danger of being bombed by the enemy, but how great are the chances of catastrophe from the avoidable risks accompanying our own defensive activity, while it is this activity which rings us round for long periods and on repeated occasions with the tumult of hell. Almost all of what we hear and what we see—and the less we try to see anything the better—amount to sound and fury, and although they are far from signifying nothing, the simple precaution of taking cover leads to probable safety.

The evidence of medical men who reside in the attacked centres or who have been present quickly on the scene of an accident, or who have been summoned to attend the victims of shock, all goes to show that the inhabitants of London have steadily improved in courage and calm as they have learnt the measure and the sources of the dangers to which they are subjected; and we are glad to state positively that among those whose natural anxiety has been greatest—and there is not a soul among us who does not feel anxious during an aerial attack for himself as well as for those nearest and dearest to him—the power of recuperation has manifested itself with great rapidity. The recurrence of the dangers has tended not to exaggerate those dangers, as the enemy hoped fondly would happen if attack followed often upon

attack, but rather has made the circumstances more tolerable; and it is this growing bravery which has become a feature of our psychology, and which accounts for the fact that a short relief from strain is almost invariably followed by a complete recovery of balance.

Training in Citizenship.

THE prophylaxis of responsibility has never been a success in this country and the adolescent boy or girl exposed to the full brunt of independence without any previous experience often succumbs to attacks of wrongheadedness, with results which may in one social class lead only to distressful family relations and in another to collision with external authority. The recent outbreak of juvenile crime is an example of the latter which cannot be set aside as a matter solely for punitive action. The Bishop of BIRMINGHAM in a recent letter to the *Times* describes with accuracy and restraint the nature of the complaint and goes on to put his finger upon its cause. Reasonable obedience to authority and regard for the demands of the social necessities of the community are, he says, almost dead in the vast mass of the youth of the land, as a natural and inevitable consequence of the fact that the growing girl and boy receive little assistance in any direction towards a training in citizenship. This has been the prime failure in the national education of the present time, and the result is just as inevitable as the exposure to measles of a community which has had no training in protection against it. Dr. WAKEFIELD considers —and all thoughtful people will agree with him—that an effective training in citizenship is an essential part of elementary education. But it is no use now relying upon a future educational system which will come too late to be effective for the upgrowing generation, even if it accomplishes something useful later on. He therefore suggests a combination of existing organisations dealing with young people for the purpose of conference and combined action. The response already made to his letter shows that some at all events of these organisations are keenly alive to the need of action, which is indeed imperative for the satisfactory solution of the myriads of after-war problems.

THE Harveian Oration of the Royal College of Physicians of London will be delivered at the College by Dr. Robert Saundby, at 4 o'clock, on Thursday, Oct. 18th.

LITERARY INTELLIGENCE. — Lord Rhondda will contribute an introduction to the new edition of Sir William Crookes's book on "The Wheat Problem," which Messrs. Longmans will shortly publish. An additional chapter on Future Wheat Supplies has been contributed to the book by Sir R. Henry Rew, K.C.B.

WAR EMERGENCY FUND OF THE ROYAL MEDICAL BENEVOLENT FUND.—At a meeting held in London on July 31st last it was decided to hold a general meeting of the medical profession in October in order to nominate a representative general committee and to discuss the best methods of promoting this appeal. This meeting has now been arranged for Wednesday, Oct. 10th, at the Medical Society's Rooms, 11, Chandos-street, Cavendish-square, W., at 5 P.M. It is hoped that the meeting will be largely attended in order that the appeal may be well supported and made widely known to the medical profession and the public. Lieutenant-Colonel Sir Alfred Pearce Gould, K.C.V.O., will preside.

Annotations.

"Ne quid nimis."

INSINCERITY IN CASES OF WAR INJURY.

A RECENT number of the *Paris Médical* contains an essay on insincerity as a feature of certain cases among the wounded which, though its conclusions are admittedly tentative, forms an interesting attempt to clear the air and facilitate further investigation. The authors, M. Laignel-Lavastine and M. Paul Courbon, are in charge of the centre, under the military government of Paris, for the examination of soldiers who, in the absence of evidence of organic disease, are suspected of "ill-will." They divide functional states into two groups: in the first the patient is unaware that he is the originator of the troubles of which he complains, and is therefore sincere in making himself out to be ill; here are placed those psychoses characterised by impairment of the critical faculties, notably hysteria. In the second group the abnormal functional manifestations are directly dependent on the conscious "mauvaise volonté" of the patient; to be consciously aware of being the cause of his own complaint is the mark of the simulator. In the latter case the physician, recognising the illegitimate nature of the symptoms complained of, may distinguish three categories: (1) somatic disturbances, comprising mutilation and "pathomimia," or the artificial concoction of a diseased condition; (2) functional disturbances or simulation properly so-called; (3) functional disturbances grafted on a genuine organic affection, including exaggeration and perseveration. The diagnosis of malingering is really a psychological problem; in other words, the question is whether the patient has or has not the intention of deceiving. Now to detect an individual's intention is notoriously difficult; it is perhaps more prudent, therefore, merely to say, in a particular case, that there is no reason why the symptoms should not disappear. But this attitude is obviously unsatisfactory when dealing with such cases as M. Laignel-Lavastine and M. Courbon have under their care; their task is to search the reins and the hearts and to face the risk of making mistakes. If to ourselves our inner man is the sport of involuntary or unconscious deceits which render an exact determination of our motives all but impossible, how can we hope to settle analogous questions in others? The answer is that precisely this intimate deception does not impose or has less power of imposing on the outside observer. Experience shows there are constitutional peculiarities in different individuals which determine the variations in their intention to deceive. There is the pure simulator or malingerer, without apparent excuse, who does not wish to risk his life or to undergo the fatigues of warfare. Among the numerous types who advance some excuse may be distinguished the emotional simulator, who thinks he could never bear the sights of the battle-field; the hypochondriac, who thinks his physique would not stand campaigning; the man who pretends he would be more useful in less-exposed positions, or declares he has already "done his bit," or excuses himself by instancing the good fortune of some comrade. Often, too, the patient begins to malinger at the instigation of his family or continues to do so to prove to the physician he has

been wrongly accused of simulating. It must be admitted that occasionally therapeutic maladroitness suggests to the patient the idea of perpetuating his troubles, of the nature of which he was at first unaware. Exaggeration is very frequently observed; perhaps the commonest is that where the exaggeration is scarcely conscious. That symptoms may vary with the attention paid to them is not necessarily an indication of conscious deceit. The authors discuss with some minuteness the forms that simulation actually takes once the idea has occupied the patient's mind. They describe the active malingerer, who usually defeats his own purpose by challenging the observer's diagnostic power; the apathetic, who with oriental fatalism makes no reaction against the idea that he is ill, and who perseveres till the physician is exhausted; the sensitive, who eagerly falls in with the suggestions of the doctor and agrees readily enough that there is nothing the matter, yet persistently fails to throw off the influence of some trifling emotional factor. With this sensitiveness is associated a sort of mental dilettantism, which is especially noticeable in those who have already been at the front, arriving home again it may be for some genuine though temporary condition. The authors give a picturesque, yet none the less accurate, account of the devices to which the simulator has resort, and of the assumed attitudes of injured innocence, or of suspicious politeness, or of spurious anxiety to help in the unravelling of their case.

A COLOUR WARD.

Mr. H. Kemp Prosser holds the opinion that the colour of the surroundings has an enormous effect on the recovery of the sick, especially those who are depressed for one reason or another or are suffering from shell shock. An opportunity has been afforded him for carrying out his ideas by Miss McCaul, who has placed at his disposal a small ward in the McCaul Hospital in Welbeck-street. This ward he has had decorated according to his theories and the result is certainly very pleasing. He claims that it is of the first importance to remove from the patient the idea of being shut in, an idea which is truly often a cause of great worry to some sufferers. Therefore he paints the ceiling a bluish colour, so as to resemble so far as possible the blue of the sky, and the tint he employs he calls "firmament blue." This blue is also used for a wide frieze. The walls are painted a greenish yellow to represent the colour of foliage in spring, and the tint is called "Sunlight Primrose." A narrow slip of darker green separates the blue of the frieze from the walls. The floor is painted with a yellowish green, containing certainly more green than the walls. The window curtains are double, the inner curtains are mauve, and the outer curtains are pale yellow. The furniture is tinted yellow, and the bedspreads are a warmer yellow. The object of having the furniture of the same colour as the walls is that it may not be obtrusive, but, as it were, fade into the walls. The fireplace is painted the colour of silver, and even the tea-sets are chosen of a pale yellowish tint. There is no pattern anywhere in the room, except that the upper edge of the bedspreads has a simple design, and over the fireplace a small painting hangs, representing a scene near Maidstone in early spring. Mr. Prosser maintains that it is essential that no browns or reds should be used, for these colours are saddening. There is no doubt that this ward has a very cheerful effect, and we can well believe that the eyes of a man greatly depressed from shell shock or from some other cause would find in such a room as this no little relief from his depression, and this merely from the general aspect of the room. Mr. Prosser has devoted much trouble to carrying out his ideas, and though we do not endorse them fully, we feel that there is something to be said in their favour: anyhow we agree that the colouring of wards for the sick and wounded has been too little considered in the design of many hospitals. The work of Mr. Prosser will not have been in vain if it leads to more care being devoted to this aspect of hospital furnishing.

PRIMARY TUBERCULOSIS OF THE TONSIL.

IN an investigation made by Dr. A. Philp Mitchell for the Medical Research Committee, and published in the *Journal of Pathology and Bacteriology* (vol. xxi.), the author concludes that tuberculosis of the upper deep cervical glands develops from a primary focus in the faucial tonsils much more often than commonly supposed. Primary tuberculosis of the tonsil cannot be recognised by the naked eye, but requires the aid of the microscope or of inoculation experiments. Lesions tend to appear in certain sites, commonly just subjacent to the surface epithelium near the mouth of the lacunæ, less often in relation to the deeper portions of crypts, or deep in the tonsil close to the capsule. 100 cases of cervical adenitis in children and 6 in adults were examined, and in 41 of them tuberculous lesions were demonstrated in the tonsil. With regard to the type of infection, the results indicate that in Scotland, at any rate, tonsillar tuberculosis is bovine in origin. In a small percentage of children Dr. Mitchell found both bovine and human types in the tonsillar crypts without demonstrable lesions either in the tonsils or elsewhere. He concludes that, on the curative side, tonsillectomy is essential in all cases of tuberculous cervical adenitis in children, and, on the preventive side, that the only immediate safeguard is the sterilisation of all cows' milk supplied to infants and children. The article contains a careful survey of previous work on the same subject, with an adequate bibliography. The author has succeeded in throwing fresh light on a very important problem.

THE SURGERY OF THE NOSE FROM AN ÆSTHETIC POINT OF VIEW.

THERE are few things of less real importance in itself than an ill-shaped nose; yet though such a nose serves olfactory purposes, if it be of a very unusual shape it may cause its possessor real anguish. All owners of an eccentric proboscis have not the qualities of Cyrano. When the sufferer seeks the aid of his own medical adviser he is usually told not to worry about a matter which is not of the least importance, and if the patient has the right temperament sounder advice cannot be given. But in other cases, where there is something definite that might be done, and where the patient's mental distress is very real, we think his complaint should be met in a different spirit. In a recent issue of THE LANCET we printed a paper by Dr. Julien Bourguet, of Toulouse, in which he described briefly the methods which he employs to remedy certain nasal

deformities, and he gives illustrations of some of the patients on whom he has operated, showing the original conditions and those left after operation. He thus proves how much may indeed be done by care and skill in many cases. Most of the results have been very good, for one important point in the method employed by Dr. Bourguet is that all the operative procedure is done from within the nose, the incisions being made through the mucous membrane, so that there is no external incision and no external scar. It is hardly necessary to say that in this country also there are surgeons who practise these cosmetic operations with success, and the numerous cases of nasal deformity which may be found among the wounded in the war offer a fine field for much good work, which should not be invariably closed by the suggestion to the patient that he had better put up with a trouble which does not affect his general health. Of course, a more difficult problem faces the surgeon who has to deal with cases where the nose is completely destroyed than where he has only to remedy an ugly shape. Here there can be no question of a slight operation; any operation that is done must be extensive and thorough, if the result is to be anything more than a travesty of a nose. The result cannot be called satisfactory unless it satisfies the patient, for the operation is only undertaken for the purpose of giving the sufferer relief from the annoyance of being without a nose. Since the days of Tagliacozzi the operation of rhinoplasty has had many exponents, and in favourable cases the results have been excellent, satisfying even the most exigeant of patients, while the operation devised and first practised in India may give results leaving little to be desired. There are, however, many cases of destroyed nose where the conditions of the tissue in the vicinity render thorough operation impossible. Some time ago[1] we published an illustrated account of nasal prosthetic feats. Lieutenant Derwent Wood, A.R.A., there showed, with the aid of some striking illustrations, the marvellous improvement which may be effected in the appearance of patients by the aid of masks of greater or less extent, according to the individual cases. Mr. Wood's knowledge as a sculptor enables him to imitate as perfectly as possible the former condition of the face, so that the patient may look as he looked before. The war has provided no small number of cases for the exercise of skill in these cases, and in many cases a marvellous alteration for the better can be accomplished.

IRITIS AND OPTIC NEURITIS FROM TONSILLITIS.

THAT tonsillitis may be the starting-point of many forms of systemic infection and of inflammation in other organs, such as endocarditis, pneumonia, meningitis, and nephritis, has been recognised in recent years. Though the relation between iritis and other forms of ocular inflammation and septic foci in other parts has been emphasised in the same period, the importance of the tonsil as a source of infection is not sufficiently recognised. In the *Boston Medical and Surgical Journal* Dr. I. Sobotky has reported a case of iritis and optic neuritis following tonsillitis in which tonsillectomy was curative, thus confirming the connexion. A woman, aged 21 years, convalescing from acute follicular tonsillitis, was seen on Oct. 19th, 1915. She showed enlarged and tender cervical glands and extreme congestion around the right cornea. She gave a history of attacks of tonsillitis, usually at yearly intervals and followed after a week by inflammation of the eyes. In the present attack the right eye was very painful and sensitive to light. She was sent to the Massachusetts Eye and Ear Infirmary, where the following record was made: "Oct. 20th: Iritis of right eye. Optic neuritis of both eyes. Pupil well dilated and regular. Upper lid slightly swollen. No evidence of syphilis. Oct. 25th: Less pain in right eye. Left eye, slight ciliary congestion. Oct. 29th: Nasal examination shows rhinitis and diseased tonsils. X ray report: Teeth and accessory sinuses negative." Dr. Quackenboos agreed with Dr. Sobotky that the tonsils should be removed. On Nov. 4th this was done. They showed chronic inflammation and the crypts were filled with caseous material. The Wassermann reaction was negative. On Dec. 14th both optic discs were swollen to at least two diopters with some dilatation of the vessels. On Jan. 11th, 1916, the swelling had diminished. On March 1st, but for slight blurring, the discs were normal. On Jan. 25th, 1917, the patient resumed work as a stenographer and has remained quite well since that date.

[1] THE LANCET, June 23rd, 1917.

NOTIFIED VENEREAL DISEASE IN CHRISTIAN

IN his annual report for 1916 on venereal disease, reprinted from *Tidsskrift for den Norske Laegeforening*, P. Schou, medical officer of health of Christiania, gives an account of the system of notification adopted in that city. Though the report contains much interesting statistical information, it omits many details which, to readers unacquainted with legislation on venereal disease in Norway, would have given a more comprehensive survey of the subject. 3240 new casse of venereal disease were notified, of which 1930 were gonorrhœa, 405 soft sore, 860 acquired syphilis, and 45 congenital syphilis. Of cases of extragenital infection there were 12 of primary syphilis of the lip, 8 of the tonsils, 1 of the abdomen, and 1 of the second finger of the right hand. In 70 cases the notifications contained information which led to investigation of the source of infection, and of these the search resulted in disclosure of the sources of infection in 43 cases. According to information received the medical officer of health and the assistant woman doctor examined 21 men and 25 women, of whom 1 man and 1 woman were "found" by the police. Five men and 4 women, instead of attending on the medical officer of health, let themselves be examined by other doctors and produced certificates; of these patients 3 men and 4 women proved to be infected. None refused to be examined. Of the notified patients, 140 men and 1 woman declared they had been infected outside the town, and of these a large proportion were sailors whose infection had occurred in foreign ports. The number of those infected outside the town was evidently greater; but some doctors did not specify the place of infection on notification. With the best of intentions the notifying doctors must probably often have found it impossible to provide this information. As regards marital infection, 22 women and 14 men notified their consorts as the source of infection. On account of intimate association with patients suffering from venereal disease (relations, adopted children, &c.) 6 men and 7 women were examined, with the result

that 1 woman was found suffering from syphilis and 1 from gonorrhœa. The report does not, however, state how the disease was contracted in these two cases. Further, 460 men and 138 women were examined by the medical officer of health and the assistant woman doctor after having voluntarily reported themselves to the medical officer of health in order to receive treatment or to be sent to hospital. Of the total number of patients examined, 28 men and 60 women were admitted to hospital. The Board of Health defrayed the expenses of special treatment for 209 men, of whom 69 suffered from syphilis. The woman doctor treated 49 women and 2 children at the Board of Health. Of these, 32 women and the 2 children suffered from syphilis. Certain cases of venereal disease which were given ambulatory treatment by the Board of Health were also given free medicine; this raised the cost during the year to kroner 3862, as compared with kroner 2782 in 1915. One notification dealt with a case of infection with syphilis after treatment with salvarsan. The medical officer of health approached the police 22 times with a view to securing their help for revealing sources of infection. One woman was admitted to hospital by the help of the police. The police notified 19 women and secured one conviction of offence against the law that any person who knows that he or she suffers from venereal disease and yet indulges in sexual intercourse or exposes another person to infection is liable to punishment up to three years' imprisonment. Dr. Schou does not state what penalty followed this isolated conviction, nor does he say why convictions were not secured in the other cases notified by the police. That they secured only one conviction out of 19 cases is, however, in itself an eloquent testimony to the difficulties encountered in legislative attempts to penalise the spread of venereal disease.

THE ORGANISM OF TYPHUS.

IN the third number of *The New East*, a monthly review of "thought and achievement in the Eastern and Western worlds," published in English and Japanese at Tokyo, appears a short summary by Professor Futaki and his colleagues of the present position of the search for the causal agent of typhus. Typhus was introduced into Japan from Russia in 1914, and the epidemic since occurring has afforded ample opportunity for etiological study. So far various competing agents have held the field: bacilli described by Ricketts and Wilder, intra-leucocytic bodies by Nicolle, both in 1910; a diplobacillus noted by Rabinowitsch and a diplococcus by Furth in 1912; other intra-corpuscular bodies seen by Prowazek, and recently cocci again by Plotz and his co-workers. After carefully examining these rival claims Futaki reported to the Japanese Congress of Internal Medicine in April, 1916, his inability to confirm any of them from his own observation, adding his conclusion that the virus was either a free, non-visible corpuscle or a minute spirochæte. After finishing an investigation into rat-bite fever with the isolation of a spirochæte the Japanese observers have now done the same for typhus. In April of this year a spirochæte was found in the lumen of a kidney tubule in a patient dead of typhus, and similar organisms in the next seven cases examined except one at a very late stage of the disease. Later spirochætes were found in the urine of patients in an early stage, and injections of blood from one such made into a *rhesus* monkey gave rise after nine days' incubation to an illness in which similar spirochætes were found in kidneys and urine. The organism is described as resembling in form the *S. pallida*, 6-8 μ in length, with 5-7 windings, and a short cilium at each extremity. It stains with silver and Giemsa. Dr. Futaki and his colleagues at the Imperial Institute for Infectious Diseases, Tokyo, believe the organism they describe to be the causal agent of typhus, and propose for it the name of *S. exanthematotyphi*. The name is correct but cumbrous in Western characters, and if the Japanese organism, as seems probable, retains its place, we might prefer to call it *S. japonica*.

ANNUAL REPORT OF THE CHIEF VETERINARY OFFICER FOR THE YEAR 1916.

THE report for 1916 of the Chief Veterinary Officer of the Board of Agriculture and Fisheries (published by H.M. Stationery Office) shows that the problem of combating the diseases of animals at home must not be neglected, even though the thoughts of everybody are concentrated on war and war areas. England, from its insular position, is especially fortunate in regard to its ability to prevent the entry of suspect animals from abroad, as it is enabled to enforce quarantine precautions; and for this reason there are some maladies which continental veterinary authorities are called in to deal with which do not exist with us. However, some of these contagious diseases still gain an entrance, and this in a manner at present not satisfactorily explained, but the necessity of careful attention to home matters as well as those outside the island of Great Britain itself is thus demonstrated. Foot-and-mouth disease of cattle is an instance of this, an outbreak of which occurred on Feb. 10th at a place as far away from a port of cattle debarkation as Shepton Mallet in Somerset. By the skill of the veterinary inspector it was diagnosed and reported, and the Board of Agriculture confirmed and dealt satisfactorily with it. Careful inquiries, however, failed to detect the origin of the outbreak. In the report the other scheduled diseases are dealt with, particularly swine fever, swine erysipelas, tuberculosis, glanders, anthrax, and sheep scab. 4331 outbreaks of swine fever were confirmed, an increase of 337 on the previous year. Serum treatment was accepted by the owners in 83 per cent. of suitable cases, the results showing a benefit of 17 per cent. in favour of pigs on premises where such treatment was applied. Serum treatment being preventive and not curative, successful results depend largely on getting early in touch with outbreaks. Greater finality is hoped from treatment with sero-vaccine, which is still on its trial, since the mortality from the treatment itself has been considerable. About 9000 specimens were examined and reported upon in the Veterinary Laboratory—altogether a busy year's work when many of the staff are away on active service.

AN exhibition of war specimens, collected by members of the Royal Army Medical Corps and prepared by members of the museum staff of the Royal College of Surgeons, will be opened in the museum of the College, Lincoln's Inn-fields, W.C., on Thursday, Oct. 11th, at 3 P.M., by Sir Alfred Keogh, G.C.B., Director-General of the Army Medical Service. At the same time the Council of the College will present its honorary Fellowship to Sir Alfred Keogh.

THE CONTROL OF VENEREAL DISEASES.

National Council for Combating Venereal Diseases.[1]

THE question of the artificial prophylaxis of venereal disease has been discussed at a recent conference of the National Council and at two meetings of its Executive Committee. A special meeting of the Council is to be held on Monday, Oct. 15th, at 8.30. P.M., at 1, Wimpole-street, W., to consider the following resolution submitted by the Executive Committee :—

In view of the public attention now directed to the whole subject of prophylaxis, the Executive Committee, after careful consideration, is not prepared to depart from its original position, in which, in accordance with the spirit of the Royal Commission's Report, it refrained from recommending the adoption of prophylaxis—i.e., the provision of outfits to men before sexual indulgence. The committee strongly urge the importance of the making of arrangements for the early treatment of venereal disease even before the outset of symptoms.

An informal discussion on the progress of the movement between members of the executive and other committees and the members of the National Council will take place at a reception to be held at the Grafton Galleries at 8.30 P.M. on Tuesday, Oct. 16th, when delegates from the various branches will be present.

Measures Taken in New South Wales.

Speaking at the recent annual general meeting of the Royal Prince Alfred Hospital at Sydney Sir Thomas A. Stuart, chairman of the board of directors, spoke of the work of the evening venereal clinics instituted in 1914 at the request of the State Government. Before the establishment of these clinics a large number of cases were not treated at all, or were treated by quacks. The Royal Prince Alfred Hospital was the only institution responding to the Government's appeal, with the result that patients came in crowds and overwhelmed the resources of the hospital. In 1915 more than 2000 cases were on the books during the year, while in 1916 the number was 2643. On one occasion it was necessary to call in the police to assist in maintaining order, and the board was reluctantly compelled to reduce the numbers admitted to the clinics. The hospital has 30 beds for women and children suffering from venereal diseases and has served as a model for the establishment of similar clinics in three other States and in New Zealand.

Sir Thomas Stuart referred to a report made to him by the medical superintendent of the hospital, who had just returned from Egypt, where he had been instrumental in carrying through certain preventive measures. A prophylactic or preventive tent was established at the entrance of each camp for men returning to their quarters after having exposed themselves to infection. Of a certain series of 2000 cases only three developed disease, while in another series in the first month after the system had been established, of 432 men who were attended to in the tent not one became infected, while of 35 men who developed the disease not one had visited the tent. Acting on this report the Commonwealth Defence Department has established similar arrangements at each military camp in the several States.

Enlightenment Campaign in Victoria.

The Public Health Department of the State of Victoria has issued a 16-page pamphlet dealing in popular manner with venereal diseases: (1) the causes, symptoms, and results of venereal diseases; (2) the provisions of the Venereal Diseases Act; (3) directions to parents and guardians regarding children suffering from venereal disease; and (4) the provisions relating to advertisements.

The provisions of the Venereal Diseases Act, 1916, may be briefly summarised as follows: 1. Any person suffering from a venereal disease shall forthwith, on becoming aware of his condition, consult a medical practitioner, either privately or at a hospital or clinic, and shall also supply his correct name and address. Failure to do so renders him reliable to a penalty of £20. It is illegal for any person other than a medical practitioner to treat venereal disease. Chemists are not allowed by law to treat any person suffering from venereal disease. 2. Every patient who is under medical treatment shall continue under treatment until he has received a certificate of cure. 3. A patient may change his medical attendant, but if he does so, must inform his new adviser of the name and address of his last adviser. 4. A person suffering from venereal disease, and not being treated by a medical practitioner, may be apprehended, after due warning, and detained until cured. 5. No one shall knowingly infect any other person with a venereal disease, or knowingly do or permit or suffer any act likely to lead to the infection of any other person with such a disease. Penalty, £100 or 12 months' imprisonment, or both. 6. No one suffering from venereal disease shall prepare or handle food intended for consumption. 7. Anyone suffering from venereal disease shall take all reasonable precautions to prevent spread of infection, and shall carry out the directions and instructions of the medical attendant.

The provisions relating to advertisement prohibit under penalty of fine or imprisonment anything in the nature of a public advertisement relating to venereal diseases, nervous debility, or to the treatment of complaints peculiar to women. The offender is liable to summary arrest. Any person printing or distributing such advertisement is also liable to severe penalty. And any newspaper or any printed or written matter is prohibited from entering Victoria if it contains reference in the nature of an advertisement to the conditions mentioned. A protective clause runs as follows: "No offence, however, will be committed by any person who prints, publishes, distributes, delivers, or posts any *bonâ-fide* medical or pharmaceutical book, pamphlet, magazine, or periodical, or any work of recognised literary merit relating to the conditions referred to."

Bombay League for Combating Venereal Diseases.

The Bombay Sanitary Association, which was founded in 1902 with a view of coöperating with the Health Department in educating the public on matters of hygiene and sanitation, held a conference on March 6th and 20th, 1917, to discuss the incidence and control of venereal diseases in Bombay, at which the following resolutions were passed :—

1. That in view of the great prevalence of venereal diseases in Bombay and of their grave consequences, this conference of medical men assembled is of opinion that the time has come when the public and the State should be roused to the gravity of the situation, and induced to take measures to prevent them.
2. That a league for combating venereal diseases, and consisting of medical and lay men, be formed to educate public opinion and to devise and assist in carrying out all such measures as are calculated to prevent the spread of these diseases.

A provisional committee was appointed to take the necessary steps for the formation of the League, with the Hon. Mr. G. S. Curtis, C.S.I., I.C.S., as president, Surgeon-General R. W. S. Lyons, M.D., I.M.S., and Sir Fazulbhoy Currimbhoy as vice-presidents, and Dr. John A. Turner, C.I.E., and Dr. Lemuel L. Joshi as joint honorary secretaries. At a later meeting of this committee the aims and objects of the League were defined as follows: (1) To provide accurate and enlightened information as to the prevalence of these diseases, and as to the necessity for early treatment; (2) to promote the provision of greater facilities for their treatment; (3) to increase the opportunities of medical students and practitioners for the study of these diseases; (4) to encourage and assist the dissemination of a sound knowledge of the physiological laws of life in order to raise the standard both of health and conduct; (5) to coöperate with existing associations, to seek their approval and support, and to give advice when desired; (6) to arrange, in connexion with such organisations, for courses of lectures, and to supervise the preparation of suitable literature; (7) to promote such legislative, social, and administrative reforms as are relevant to the foregoing aims and objects.

Dr. J. A. Turner read a paper at the conference summarising the work being done in England and suggesting measures of control in Bombay. The scheme he outlined involved an initial outlay on dispensary and clinic of R.5000 with an annual cost of R.20,000 for maintenance. Dr. A. Powell described the course of syphilis among the Indian community, summarising the distinctive characters as follows: Syphilis does not by any means run exactly the same course in Indians as it does in Europeans. Hence European practitioners fresh from European schools look out for—and miss—the signs common in Europe. They find but do not correctly interpret those common in the indigenous people of this country. 1. Sore throats are much less common in India. 2. Rashes are less common. In a country where prickly heat and ringworm abound, rashes are easily overlooked, especially by the patient. 3.

[1] The address of the National Council is now Avenue Chambers, Southampton-row, London, W.C. 1. Tel.: Museum 2432.

Tabes and G.P.I. are infinitely less common in India. 4. Obscure "rheumatic"-pains in the joints, bones, and muscles are infinitely more common, more severe, and more persistent in Indians; in fact, they are often almost the only secondary and tertiary symptoms. Genuine "acute rheumatism," "rheumatic fever" with its cardiac complications, is very rare among Indians. 5. Disease of the arteries is much more common in India. It is especially common in the ascending arch of the aorta and in the coronary arteries. 6. Disease of the aortic valves is more common than disease of the mitral valves in India.

REPORT FOR 1916 OF THE COUNTY MEDICAL OFFICER OF HEALTH AND SCHOOL MEDICAL OFFICER OF LONDON.[1]

Dr. W. H. Hamer's fifth annual report in each of these capacities has just been issued. Not farther back than last November his report for the preceding year was noticed in these columns.[2] The appearance of the present volume after this brief interval indicates commendable promptitude. Readers of the last two reports will miss the instructive series of diagrams which illustrate the volume for 1914. That their actual publication has been discontinued since that year is due to economic considerations. But from the present context it is evident that their compilation is still in progress, and we may therefore hope that on the return of peace conditions this impressive method of graphic representation will be resumed in the published reports.

PART I.—PUBLIC HEALTH.

The health of London in 1916 compares favourably with that of the preceding year. The medical officer warns us, however, that the estimates of population available are still less trustworthy than were those of 1915, a fact that must be remembered in comparing the statistics of successive years. When the National Register was compiled two years ago the marked local changes caused by war were only then beginning. Consequently that register, which had never been quite reliable, could not be regarded as even approximately forecasting the subsequent movements of population. The weather conditions of last year were phenomenal, and doubtless accounted in some measure for the substantial saving of life among infants, as well as for the unusual freedom at other ages from the ravages of infectious diseases. In the year 1916 the flow of water under London Bridge was greater than in any previous year on record. The floods of the early part of 1915 had been the highest since 1894, and there followed in the year under review a flow of water in the Thames of 875 thousand million gallons. Apart from abnormal weather conditions, the study of sickness and death-rates is complicated by disturbances incidental to war.

Vital Statistics.

The marriages in London during 1916 were fewer by about one-third than those of the previous year, the decrease being greatest in the second half of the year. The abnormally high number of marriages during the progress of hostilities probably corresponds fairly with the movements of enlistment. Difficulties arise in calculating a marriage rate for comparison with pre-war figures, owing to the circumstance that the data include men on active service, while the published estimate of population relates to civilians only. The Registrar-General calculates a rate of 19 per 1000 for 1916. In the previous year it probably amounted to about 26. For analogous reasons the computation of a reliable birth-rate is beset with difficulty. The birth-rate of the year under notice is officially estimated at 21·5 per 1000, against 22·5 in 1915; these rates may be generally compared with the average in the quinquennium before the war—viz., 25 per 1000.

Effect of war conditions on mortality.—The Registrar-General calculates the death-rate of 1916 at 14·7 per 1000 of the civil population. The rate of 1914 had been 14·6, calculated on the total population in the middle of the year. Thus, with fewer deaths in 1916 the mortality is stated to have been higher. This, however, is an anomaly depending solely on the use of a civil population, without correction for changes among the living resulting from the withdrawal of males of military age—a period of relatively low mortality. In the absence of hostilities the death-rate of last year would have been below that of 1914, and probably would have barely exceeded 13·6, the low rate of 1912. At most ages the mortality in 1916 shows a decided improvement upon that of 1914. The decrease in the deaths under one year is partly due to the still falling birth-rate, but not more than 10 per cent. thereof can be thus accounted for. The rate of infant mortality last year was 89 per 1000 births, and was 2 per 1000 above the lowest rate hitherto experienced in London. The favourable condition of moderate summer temperature has doubtless contributed to this result, but it is probable that the recent restrictions on the sale of intoxicants has had a large share in reducing the deaths from suffocation, and perhaps also from prematurity. It is worthy of mention that the decline in mortality has not taken place among infants *pari passu* with the decline at the higher ages; on the contrary, it has only become conspicuous during the current century, and particularly within the last seven years.

Infectious diseases.—The behaviour of infectious sickness last year was essentially similar to that in 1915. London suffered no disaster from the spread of typhus fever, and in spite of the importation of a few cases of small-pox that disease never obtained a foothold. The civilian notified cases of scarlet fever numbered 8746, or about half the total reported in the preceding year, and about one-third the total in 1914. There were fewer attacks in 1916 than in any year since 1891, when notification first became compulsory. The cases of diphtheria notified among civilians numbered 8743, differing little from the totals in each of the two preceding years. Enteric or typhoid fever still continues to decline. The notified attacks in 1914 had numbered 789, and in the following year 607, whilst there were only 461 in the year under review. Among many possible sources of infection fish or shell-fish were inculpated in 85 instances. The year 1916 was the fifth in succession in which there was marked smoothing out of the autumnal rise in London. The experience of last year confirms that of 1915 respecting the complete failure of evidence of increased spread of infection by human agency. For, after making due allowance for the absence abroad of susceptible persons, the prevalence of typhoid in London in the last two years has been actually lower than ever before known, despite the addition to the community of an appreciable number of typhoid convalescents from abroad. On the other hand, recent phenomena tally well with the theory of food causation. It is noteworthy that, as the late Dr. H. T. Bulstrode asserted in his reports of 1896 and 1911, a steady improvement has been brought about in the last 20 years by the elimination of dangerous shell-fish. As regards further reduction of typhoid fever, there is reason to believe that more benefit is likely to result from pursuing the older epidemiological methods than from giving effect to the new principles advocated by Koch and his followers. In particular, further care for the purity of shell-fish layings and entire prohibition of the sale of ungutted flat fish are to be looked upon as the main lines upon which further advance can be made.

Phthisis.—The civilian deaths from phthisis in the year 1916 numbered 6491, as compared with 6875 in 1915 and 6476 in 1914. At military ages there was a decrease last year on the deaths registered in 1914. The calculation of a mortality rate for the civil population from the above figures would give a result in no respect comparable with pre-war rates; for not only has the war left on the civil population practically all the pronounced phthisis, but a portion of the fatal cases among persons accepted for service, and among those subsequently discharged for tuberculous disease, are recorded as civilian deaths.

Cerebro-spinal fever.—In the course of last year 425 cases of this disease were notified among the civil residents of London, or fewer by 202 than in 1915. These figures do not include posterior basal meningitis. The Registrar-General tells us that in London cases of the last-named disease are notifiable under the head of cerebro-spinal fever, whilst elsewhere there is no uniformity of classification. In view

[1] King and Son, Westminster, pp. 42. Price 1s.
[2] THE LANCET, Nov. 11th, 1916, p. 837, and Nov. 25th, 1916, p. 913.

of this and other difficulties computation of fatality rates has not been attempted, it being evident that records of death from cerebro-spinal fever for London bears no consistent relation either to the notified cases of that disease or to the actual number of deaths from this cause.

Poliomyelitis.—There was an increase last year in the attacks by this disease reported throughout the country generally. In London 197 cases of poliomyelitis were notified, the highest number previously reported having been 145 in the year 1913.

PART II.—EDUCATION.

A large share of the energy of the County Council's medical staff continues to be devoted to matters connected with education. Of the administrative difficulties encountered in the preceding year as the result of war conditions no abatement was experienced in 1916. Thanks to the special efforts made by the older men and by the women already employed as school doctors, the work of medical inspection has been prosecuted with considerable success. Moreover, the difficulty of securing the services of a sufficiency of qualified persons for the hospital treatment of school children has been satisfactorily met. The further difficulty of retaining an adequate supply of nurses has been overcome by the Council, who have adopted financial measures against the further depletion of the nursing staff, whose full efficiency is essential in this department of the public service. The work of "following up" has been rendered particularly onerous by reason of the serious defection of volunteers. To meet this emergency the care committees of several adjacent schools have coöperated with the view of economising the work of home visitation, and thus carrying out the duty of following up in urgent cases albeit with a reduced number of visitors.

Medical inspection and treatment.—Of the children primarily examined by the doctors last year in elementary schools 88,415, or nearly one-third, were found to require treatment for defects. Reinspections were made of the children who at the first examination had been found ailing, with the result that 41·7 per cent. had been brought under treatment within six months, as compared with 49·6 per cent. in 1914. Between the authorities of maternity centres and the school medical service satisfactory cöoperation has been established. In two instances the premises of the school treatment centres are also used by the maternity centre for the treatment of mothers and of children under school age. Similar cöoperative schemes are in prospect at four other centres. The open-air schools at Birley House and Shooter's Hill were kept open throughout the year. Kensall House school for tuberculous children has also been continued, and some of the playground classes have been held in the public parks. Altogether 5422 children were examined during the year with a view of admission to special schools, and of these rather more than half were certified as suitable for admission. The remainder were either returned to elementary schools or were declared unsuitable for any of the Council's institutions.

Personal hygiene.—There are now 24 cleansing stations in London, at 20 of which scabies is admitted for treatment; more than 3000 children suffering from scabies were given not fewer than 17,000 baths in the course of the year. Examination was made of 988,000 children, 25,000 of whom were found to be verminous. Of these, 13,000 were were cleansed by the authorities and 11,000 by the parents. Verminous children attending schools in outlying districts are now brought under the scheme, and are conveyed to the cleansing stations in ambulances. Moreover, in certain instances borough councils are now giving special facilities for hot baths to be obtained by school children and members of their families.

Nutrition and malnutrition.—At the present time children suffering from that degree of malnutrition which is known as "wasting" are rare in our schools. Conditions leading to emaciation are now detected at an early stage, the sufferers being promptly referred to appropriate agencies for relief. In the course of last year only 0·4 per cent. of the children inspected were placed in this class, against 0·51 in 1915. From figures relating to the last four years it appears that the general state of the children has been better during the war than in the period immediately preceding. The steady improvement of previous years in clothing and footgear, as well as in general cleanliness, has been fully maintained during 1916. This fact is presumably attributable in some measure to better economic conditions, but it is doubtless largely due to the maintenance of medical and cleansing work carried on for some years past in connexion with the schools. The continued improvement of the children which is revealed at the medical inspections testifies to the success of the arduous work of the school nurses. "These splendid results," writes Dr. Hamer, "which show that none of the horrors of war have been allowed to affect the general condition of the children, or to interfere with the growth of that solicitous care for their welfare which has distinguished recent years, are a matter for profound joy and satisfaction. They may well encourage us to face the future with complete confidence; for a community that can thus protect its children while putting forth the most prodigious martial efforts the world has ever seen, must be sound to the core." The dominant influence of social condition is manifest in the returns of the various parts of the metropolis. A map showing the nutritional state of the children would correspond generally to one showing their social condition. That this is so is abundantly evident from the report. In the year 1913 a special study was made of the health of children of school age. In a report respecting nearly 1000 of these children the close connexion of tuberculous disease with malnutrition was emphasised, tuberculosis being definitely recognised in 19 per cent. of the cases examined, and its presence being suspected in a large additional proportion.

Infectious diseases.—The year under review was remarkable for exceptional freedom from infectious disease among school children. In the case of scarlet fever the returns are particularly satisfactory. In certain weeks of August and December the scarlet fever notifications throughout the metropolis were fewer than 100, being only about one-third the average in the corresponding weeks of the previous four years. As causes producing this result the effect of altered nomenclature, of climatic influence, and of flea prevalence are here reviewed, and the important question of the relationship of scarlet fever is considered. As regards flea prevalence, we note that examination of the flea and scarlet fever curves in the last eight years reveals a striking correspondence in their annual variations. Among measures for limiting the spread of scarlet fever the importance of hospital isolation is taken for granted, and the fact is referred to that the low level reached by that disease in 1916 has fortunately liberated for other uses many additional beds in the hospitals of the Metropolitan Asylums Board. In respect of epidemic throat illness the record of the year under notice was unique, inasmuch as the notifications of diphtheria actually exceeded those of scarlet fever for the whole year, whilst from September onwards the excess was marked. The strange comment was made in some quarters that the position was a serious one, inasmuch as diphtheria was more widely prevalent in London than scarlet fever, the real explanation being, of course, that the figures for scarlet fever were so exceptionally low as to render those for diphtheria unsatisfactory by contrast. As long ago as the eighteenth century much confusion prevailed with reference to epidemic throat disease. It was not until 1831 that the term "diphtheria" was employed; up to 1855 the two diseases in question were classed together by the Registrar-General, and in German statistical returns the heading "Scharlach diphtherie" has continued in use till now. The discovery of the diphtheria bacillus by Klebs and Loeffler in 1883 and 1884 led to the adoption of bacteriological methods for confirmation of the diagnosis of diphtheria, and probably as a result there has been an increasing use of that term during the last 30 years. The relationship between dry years and one or both of these conditions has been exhaustively analysed by Dr. J. B. Longstaff and Sir Arthur Newsholme. Dr. Longstaff found the correspondence close in the "sixties" and early "seventies," but less marked in later years. Whilst Sir Arthur Newsholme, dealing with diphtheria alone, concludes that the essential factor in the production of epidemic, and still more of pandemic, diphtheria is the occurrence of a succession of years of deficient rainfall, associated as they must be with abnormally dry conditions of the soil and subsoil.

DONATIONS AND BEQUESTS.—The committee who are distributing the residuary estate of the late Mr. Leopold Salomons have allocated a further £50,000 to hospitals.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

The Importation of Malaria into France.

I HAVE several times mentioned the existing fear that subjects of malaria, who are returning to France in great numbers from the Salonika Forces, should prove sources whence malarial disease may develop in their native country. Against this apprehension it has always been urged that the intervention of particular kinds of anopheles is required, and that the culices and anopheles met with in France are inoffensive. For prudence sake, however, it has been recommended that hospitals reserved for the subjects of malaria should be placed in localities where there is not much stagnant water or many breeding places for gnats. Definite proof now comes that fears on the subject were not exaggerated and that the hæmatozoa of oriental malaria can be transmitted by our indigenous anopheles, which seem to be capable of this new and regrettable adaptation. M. Victor Raymond and M. Grysez proved the possible occurrence last spring of cases of malaria among soldiers coming direct from regions in France where the disease is unknown, but who had occupied trenches where the soldiers preceding them had returned from Salonika, having contracted malaria; the *terrain* was flooded and mosquitoes abounded there, among them several kinds of anopheles. A confirmation of the possibility of outbursts of malaria, derived from the East, and one having great weight, has now been furnished by M. Laveran, who has presented to the Académie des Sciences a research carried out at the Pasteur Institute by M. Rouband. M. Rouband has submitted to bites from indigenous anopheles malarious subjects who have returned from Salonika with the disease upon them. He has found in the proboscis of these anopheles living hæmatozoa, and having submitted himself to bites succeeded in contracting malaria of a characteristic form, with periodic febrile accessions and the presence of hæmatozoa in his blood. M. Laveran concludes from this that it is necessary to keep the victims of malaria away from regions where the mosquito abounds, and to instal on elevated plateaux, where the nights are cold, hospitals reserved for them, the beds being furnished with nets. Otherwise there is, he says, a risk that after the war malaria may invade France and render it, or at any rate our warmer regions, as unhealthy as the oriental plains.

Breastplates for Soldiers.

Inspector-General Delorme has called the attention of the Académie de Médecine to the frequency and immediate gravity of penetrating wounds of the thorax and abdomen. These represent an enormous proportion of deaths on the field of battle, while the adoption of steel helmets has considerably diminished the total of grave wounds of the skull. Wounds of the heart, big vessels, lungs, and abdominal viscera account for the chief part of the mortality among those of the wounded who die before there is time to render them proper care. These wounds in a trench war are due, not for the most part to rifles or machine guns, against which there is no possible protection, but to the bursting of explosive projectiles, hand grenades or shrapnel, all of which inflict wounds with a relatively feeble initial velocity, so that a method of protection, which would be powerless against bullets, would meet the case. In view of the excellent results given in head wounds against the same sort of projectiles by the steel helmet now used by all the soldiers, M. Delorme proposes that the troops should be provided with a breast-plate of the same metal and thickness, suspended round the neck and covering entirely the front of the trunk from the root of the neck to the pubis, the weight not being greater than that of the helmet; this breast-plate could be placed over the back when kneeling in the trenches or when lying flat on the stomach. The Académie de Médecine has unanimously decided to invite the Minister of War to submit the idea to practical experiment.

The Disappearance of Small-pox from Paris.

At the last meeting of the Seine Board of Health Dr. Roux, of the Pasteur Institute, reported on the results of small-pox vaccination in Paris during 1916. The 800,000 vaccinations performed in Paris at the outbreak of the war and during the year 1915 resulted in the disappearance of small-pox from the city, and in spite of the fluctuation in population due to mobilisation, and of the fact that Paris had given shelter to a number of refugees from the invaded districts, the capital remained immune from small-pox. This had occurred although all the conditions favourable to the breeding of the disease were notably present, among immigrants both morally and physically reduced, of whom the greater number had not been revaccinated and some not vaccinated at all. Small-pox infection was repeatedly introduced from outside sources without spreading in the city. Dr. Roux considers that a prolonged war without small-pox is a remarkable fact, proving the efficacy of the prophylactic measures taken. The honour of the achievement is due to the vaccination service as well as to the public, which has eagerly responded to the appeals addressed to it by the Government in placards and newspaper advertisements. During the year 1916 only a single case of small-pox was notified in Paris, and one case was imported from Algiers. The latter was an Arab who had not been vaccinated in infancy, and who arrived in Paris during the period of incubation; he was admitted to the hospital Claude-Bernard, where he died. This Arab worked in a factory where 1000 men were employed, living with his brother. The workmen and the brother were vaccinated on the day the disease was recognised and not one of them contracted it.

Antirabic Inoculation at the Pasteur Institute in 1916.

During the year 1916 1391 persons underwent preventive inoculation at the Pasteur Institute in Paris; six died of hydrophobia, giving a gross percentage of 0·43. But two of the patients developed the disease while still under treatment, and one died less than a fortnight after its conclusion. Deducting these three, the revised statistics stand: Persons treated, 1388; deaths from hydrophobia, 3; mortality, 0·21 per cent.

Improved War Bread.

The war bread used in France, made from 85 per cent. flour, has given rise to much complaint. The grey-black colour and unpleasant taste have disgusted a number of consumers, with the result that a large amount has been wasted, and the question has arisen whether economy would not be better served by providing bread made with normal flour and limiting its consumption by a special bread-card. It is not disputed that the present bread keeps badly and quickly undergoes acid fermentation, leading to gastric and intestinal disorders in persons predisposed to dyspepsia. The researches undertaken by MM. Lapicque and Legendre at the Ministry of Inventions have now made it possible to grind the flour to the 85 per cent. standard and still avoid the greater part of the objectionable qualities. They have shown that the constituent of war flour eliminated from 70 per cent. (white), known by millers as *recoupettes*, is the part which deteriorates by fermentation and gives rise to acid products. By alkalising the flour when it is mixed this injurious fermentation is held in check. M. Lapicque bases his conclusions on a simple experiment which can be readily confirmed. A piece of slaked lime wrapped in a piece of cloth and held by a string is placed in the bowl from which the baker takes his water for making the dough. The quantity of lime which dissolves under these conditions is 1 : 1000, and exactly the proportion required for checking fermentation; it is therefore only necessary to see that the lime is renewed when exhausted. The manufacture involves practically no extra trouble to the baker, while the increase in cost is trifling, less than 5 cts. for 3000 kilos., 1 gramme of lime being sufficient for 3 kilos. of bread. The quantity of hydrated lime introduced into the daily diet of the consumer does not exceed 10–20 centigrammes, of which the greater part becomes carbonate during the leavening. This amount is harmless, being indeed not greater than that contained in a glass of milk. The new war-bread is much superior to the old; the dough is well risen, whiter, and not viscous; the smell is pleasant and not acid; the crust is excellent. The bread keeps well and its digestion does not lead to any disorder. The public has been quick to appreciate these advantages, and bakers who have begun to make the bread according to official instructions based on a communication by Dr. Lapicque to the Academies of Medicine and Sciences have soon been obliged to increase their bakings. It is a curious fact that even animals have noticed the difference between this bread and the other, and having once tasted the new refuse the old.

Joy-riding for Whooping-cough.

It has long been known that convalescence after whooping-cough is accelerated by change of air, by movement from one locality to another, whether from town to country, or from one part to another of the same country. From these observations Dr. Challamel claims to have deduced an original therapeutic method. He assumes that intense oxygenation of the lung is the cause of improvement, and therefore utilises the effects of motor driving in the fresh air. Under the influence of rapid transit through the air intrapulmonary pressure is probably augmented, with increased ventilation of the air cells. The effect is, in fact, the same as in the compressed-air chamber, but the joy-ride affords a practical method within the reach of all. The author has brought to the notice of the Therapeutical Society several cures effected by this treatment, which he has begun to practise at early stages of the disease, as soon as the temperature has fallen. A beginning is made with a ride of ½–1 hour at a slow speed, in an open motor, the child's face being protected from dust; little by little the length and speed of the ride are increased. The treatment can be carried out in all kinds of weather except actual rain; the presence of bright sunlight is not essential. Cures have resulted after two rides, and as a rule a few prove sufficient. The only contra-indications are fever and extreme youth. The treatment should not be employed for children under the age of three months.

Obituary.

DAVID CHARLES REES, M.R.C.S. ENG., L.R.C.P. LOND.

Mr. D. C. Rees, whose death from typhus fever in Port Elizabeth, South Africa, was recently announced in the *Medical Journal of South Africa*, was educated at Charing Cross Hospital Medical School, and after obtaining the Diploma of the Conjoint Board went out to Nigeria with General Lugard's Frontier Force. He went up the Niger, saw service there, and gained considerable experience in the diseases of the country. On his return the London School of Tropical Medicine was just being opened, and Sir Patrick Manson immediately secured his services as the superintendent, or, as it was then called, medical tutor of the school. The first session opened on Oct. 1st, 1899, and Mr. Rees was responsible for organising the lectures and other details of the course. So well did he do this that the general scheme adopted by him has held till the present day. He was himself an able teacher, and had a happy knack of interesting the early students in the laboratory work, most of which was usually quite new to them. In the summer of 1901, during the vacation, he visited the experimental house, set up by the School in the Roman Campagna for malarial experiments, and he stayed there for several days with Dr. L. Sambon and Dr. G. C. Low, the experimenters. He then returned to the school for the fourth session, and worked in London till the end of the year, finally, to the sorrow of all his fellow teachers, giving up his appointment to take up the very important one of district surgeon and port health officer at Port Elizabeth. Here the opportunity of combating plague and small-pox presented itself, and, ably dealing with these, Mr. Rees made a name for himself in this line; that he should have died from typhus, the disease he was trying to stamp out at the moment, is very sad. After taking up his residence in South Africa he did not have the time or opportunity to come much to London, but he visited the capital on the occasion of his marriage and again three or four years ago, when he renewed his old associations with the School of Tropical Medicine.

There is little doubt, if Mr. Rees had stuck to tropical medicine, that he would have become famous in that section of medicine. Befcre leaving for Africa he wrote on tropical subjects to the journals, and these contributions were always well written and carefully thought out; but work in Port Elizabeth did not allow him to keep up his literary activity. At the time of his death Mr. Rees was in his fiftieth year, and he has left a widow and two children to mourn their loss. To them we offer sincere sympathy, and the London School of Tropical Medicine and all its teachers who knew and were associated with the deceased will offer them the same.

The War.

THE CASUALTY LIST.

THE following names of medical officers appear among the casualties announced since our last issue:—

Killed.

Capt. B. A. Bull, R.A.M.C., attached London Regiment, was educated at Oxford and at St. Bartholomew's Hospital, London, and qualified in 1915. Shortly afterwards he joined up.

Died of Wounds.

Capt. F. Hardie, R.A.M.C., qualified at Edinburgh in 1900, and was in practice at Southampton prior to joining up.

Died.

Lieut. D. Anderson, R.A.M.C.

Wounded.

Capt. A. C. Ransford, R.A.M.C.
Capt. R. G. Abercrombie, R.A.M.C.
Capt. G. A. Macfarlane, R.A.M.C.
Lieut. C. B. Simpson, R.A.M.C.
Capt. D. L. Tate, R.A.M.C.
Capt. F. G. Flood, R.A.M.C.
Capt. F. A. L'Estrange, R.A.M.C., attached Rifle Brigade.
Capt. M. McNiff, R.A.M.C., attached Durham Light Infantry.
Lieut. G. H. Adam, R.A.M.C., attached Lancs Fusiliers.
Capt. F. Black, R.A.M.C., attached Royal Engineers.
Lieut. C. O. Bodman, R.A.M.C.
Lieut.-Col. G. H. L. Hammerton, M.C., R.A.M.C.
Lieut. J. C. Pearce, R.A.M.C., attached Yorks Light Infantry.
Capt. D. O. Riddel, D.S.O., R.A.M.C., attached W. Yorks Regiment.
Capt. W. Turner, R.A.M.C.

Slightly Injured.

Surgeon A. E. Panter, R.N.

CASUALTIES AMONG THE SONS OF MEDICAL MEN.

The following additional casualties among the sons of medical men are reported:—

Second Lieut. J. B. Bailey, East Yorks Regiment, killed in action, only child of Dr. J. E. Bailey, of Beverley, Yorkshire.
Second Lieut. F. J. Chown, Royal Flying Corps, killed in action, only son of Dr. F. Chown, of Townshend, near Hayle, Cornwall.
Capt. R. A. Eakin, King's Shropshire Light Infantry, died of wounds, only son of Dr. J. W. Eakin, of South Mimms, Barnet, and late of Trinidad.
C. M. Richards, killed in action, only son of Dr. M. Richards, of Fremantle Western Australia.
Second Lieut. G. D. Rose, Gordon Highlanders, killed in action, second son of Dr. G. Rose, of Aberdeen.
Second Lieut. E. C. G. Hull, Royal Field Artillery, killed in action, elder son of Dr. E. G. Hull, of Streatham Common, London.
Flight Sub-Lieut. N. S. Wright, R.N., killed, son of Dr. W. S. Wright, of Wool, Dorset.

FOREIGN DECORATIONS.

French.

Croix de Guerre.—Major (temporary Lieut.-Col.) L. J. M. Deas, I.M.S.; Temp. Capt. A. L. George, R.A.M.C.

THE HONOURS LIST.

The following awards to medical officers are announced. The acts of gallantry for which the awards were made are not yet announced. All are members of the R.A.M.C. unless otherwise stated. The dates in parentheses, in those cases where bars have been awarded, refer to the number of THE LANCET in which a record of the original decoration will be found:—

Bar to the Distinguished Service Order.—Maj. J. S. Y. Rogers, D.S.O. (Jan. 22nd, 1916, p. 215).

Distinguished Service Order.—Capt. (acting Lt.-Col.) J. D. Bowie; Temp. Capt. D. Lees; Temp. Capt. I. C. Maclean, M.C.; Maj. (temp. Lt.-Col.) E. C. Montgomery-Smith; Temp. Capt. H. A. Pallant, M.C.; Temp. Capt. J. B. Orr, M.C.; Capt. G. D. Watkins.

Bar to the Military Cross.—Capt. W. B. Allen, V.C., M.C. (Sept. 30th, 1916, p. 620); Temp. Lt. (temp. Capt.) L. G. Bourdillon, D.S.O., M.C. (Jan. 22nd, 1916, p. 215); Temp. Capt. R. I. Harris, M C. (Nov. 18th, 1916, p. 881); Capt. W. McFarlane, M.C. (Dec. 16th, 1916, p. 1034); Capt. H. R. Partridge, M.C. (Oct. 28th, 1916, p. 770); Capt. J. D. Proud, M.C., Spec. Res. (June 23rd, 1917, p. 969).

Military Cross.—Temp. Capt. G. M. Adam; Capt. C. D. S. Agassiz; Capt. A. C. Bateman, Spec. Res.; Temp. Capt. S. J. A. Beale; Capt. K.

Biggs, Spec. Res.; Temp. Capt. G. A. Bird; Capt. R. G. Blair, Spec. Res.; Capt. F. D. Blandy; Temp. Capt. C. A. Brisco; Temp. Capt. W. T. Brown; Temp. Capt. W. T. C. Pearce; Temp. Capt. F. B. Chavasse; Temp. Capt. V. L. Connolly; Capt. T. F. Corkill, Spec. Res.; Temp. Capt. G. T. Cregan; Temp. Capt. D. St. C. Creighton; Temp. Capt. E. P. Dark; Temp. Capt. H. B. Day; Temp. Capt. J. W. Dorling; Capt. W. B. FitzGerald; Temp. Capt. R. S. Gibson; Capt. J. C. G. Glassford, Australian A.M.C.; Capt. H. M. Goldstein, New Zealand M.C.; Temp. Capt. J. C. B. Grant; Temp. Capt. N. Grellier; Temp. Capt. F. Harris; Temp. Capt. H. H. Hepburn; Temp. Capt. J. Hill; Temp. Lt. R. G. Hill; Temp. Lt. W. J. Isbister; Temp. Lt. R. S. Kennedy; Temp. Capt. A. F. Laird; Temp. Capt. G. E. OBITUARY OF THE WAR.

WILLIAM DUNCAN KIRKLAND, M.B., CH.M. SYD.,
MILITARY CROSS,
MAJOR, AUSTRALIAN ARMY MEDICAL CORPS.

Major W. D. Kirkland, who was recently killed on active service at the age of 26 years, was elder son of the late Lieutenant-Colonel Hugh Kirkland, M.B., Ch.M. Glasg., A.A.M.C. Born at Bathurst, N.S.W., he was educated at Coerwell Academy, Bowenfells, matriculating in 1908. Entering St. Andrew's College, Sydney, he graduated in medicine, with honours, in March, 1913, and became resident medical officer at the Royal Prince Alfred Hospital and later radiographer. After a brief but successful period of private practice at Lithgow, N.S.W., he enlisted in the Australian Imperial Force in May, 1916, and went to France in November. He had already held a commission in the Scottish Rifles, C.M.F., and was soon transferred to the Australian Army Medical Corps. He won the Military Cross by attention to wounded close to an ammunition dump in which shells were constantly exploding, and by his disregard of personal danger was instrumental in saving many lives.

Major Kirkland was a keen sportsman at school and college, which he represented in athletics. His friends feel the loss of one who was universally recognised as a pleasant companion and a capable and conscientious officer. He was unmarried.

JAMES ERNEST STUDHOLME WILSON, M.R.C.S. ENG.,
MILITARY CROSS,
CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain J. E. S. Wilson, who died of wounds on August 23rd at the age of 31 years, was elder son of the late Rev. Studholme Wilson, for many years rector of Millbrook, Southampton, and Mrs. Wilson, of Stoneleigh, Newport, Salop. He was educated at Summerfields, near Oxford, and at Radley, took his medical course at the London Hospital, obtaining the Conjoint qualifications in 1911, and starting at once in general practice at Iver, Bucks.

In December, 1915, he obtained a commission in the Royal Army Medical Corps, attached to a Bucks regiment, and left with his battalion in the following May. Two months later he was awarded the Military Cross "for conspicuous gallantry and devotion to duty during operations," after having gone through a very heavy barrage to assist the wounded. His colonel writes of Captain Wilson's courage: "He was himself hit early in the evening, but insisted on going on with his work for six hours. His name," he adds, "will be a lasting and inspiring memory to the officers and men of his battalion."

Captain Wilson married, in 1912, Marjory, daughter of the late Thomas Ireland, of Mossley Hill, Liverpool, who survives him with an only child.

RONALD LENNOX HENDERSON, M.B., CH.B. EDIN.,
MILITARY CROSS,
CAPTAIN, AUSTRALIAN ARMY MEDICAL CORPS.

Captain R. L. Henderson, who died of wounds received in action at Bullecourt in May this year, graduated at Edinburgh University in 1903 before emigrating to New South Wales, where he practised for several years at Lismore. In July, 1915, he joined the Australian Army Medical Corps and was sent to Egypt, afterwards being attached for several months to No. 2 Stationary Hospital at Lemnos. When the Australian troops left for France he went with them and remained, except for a few months' illness, until the time of his fatal injury. He was hit in the leg in June, 1916, but refused to be evacuated, and tended the wounded of his unit with no thought of personal safety. A few days before being wounded himself he was awarded the Military Cross. His superior officer writes of him: "Always a splendid companion in times of stress, his kindly humour and steadfast devotion to duty made him a favourite with his fellow officers and his men. We have lost in him a man of exceptional courage and high character."

ANTHONY TRAILL, M.B., CH.B. OXON.,
CAPTAIN, ROYAL ARMY MEDICAL CORPS.

Captain A. Traill, who died at a casualty clearing station in France on August 25th, after a few days' illness, was 27 years of age and second son of Edmund B. Traill, of Pebmarsh, Essex, and Chirú, Traill, Argentina. He was born near Dublin, and educated at Charterhouse and New College, Oxford. While at Oxford he became president of the O.U.L.T.C. and won the challenge cup. From Oxford he went to Guy's Hospital, obtaining his medical degrees in 1915. In February, 1916, he received a commission in the Royal Army Medical Corps, and went to the front in the early part of this year. While still at Oxford he had a severe attack of hæmorrhage from a duodenal ulcer, and it was a recurrence of this trouble while attached to a regiment which was the cause of his untimely death. A promising career has been thus cut short.

EDMUND FITZGERALD BANNATYNE WILSON, M.D. DUB.,
MAJOR, SOUTH AFRICAN MEDICAL CORPS.

Major E. F. B. Wilson, who died as the result of an accident on August 17th, was educated at Trinity College, Dublin, taking the M.B., B.Ch. in 1881 and the M.D. in 1890. After practising for a few years in Ireland he went to South Africa, settling in Harrismith, Orange Free State. At the outbreak of the Boer War he was still in practice in this town, but managed to escape, and eventually was given a commission as a combatant in one of the Irregular Corps which were formed. This he held for a short time, when the need for doctors becoming acute he was utilised as a medical officer. He received the Queen's and King's medals for the campaign, and after the war returned to Harrismith, when he was appointed district surgeon and railway medical officer under the British régime. In this capacity he did much useful work, and was greatly esteemed in the town and district.

At the outbreak of the present world-war Major Wilson joined up for service with the Union Forces, and after suppression of the rebellion he was sent to German South-West Africa. At the conclusion of the campaign he joined the South African Overseas Expeditionary Force with the rank of major in the 1st South African General Hospital, and after some service with that unit in England proceeded with it to France. Although nearly 60 years of age, Major Wilson was of too energetic a temperament to remain with a general hospital, and after serving with the unit for a

short period he effected an exchange so as to be attached to the South African Heavy Artillery, and he also did short spells of duty with the cavalry and South African Field Ambulance. He died as a result of a fall from his horse.

Major Wilson leaves a widow and several children, one of whom is serving overseas in the Royal Flying Corps.

W. R. ASPINALL, M.B., CH.M. SYD.,
MILITARY CROSS,
CAPTAIN, AUSTRALIAN ARMY MEDICAL CORPS.

Captain W. R. Aspinall, who was killed on active service last July at the age of 25 years, was youngest son of the Rev. A. Aspinall, M.A., of Sydney, N.S.W. He was educated at the Scots' College, and from there passed to Sydney University. Here he showed a keen interest in all branches of athletics, and won his football "Blue" in his second year. He was captain of the team when war broke out, and the same year played for New South Wales. He also took a leading position in the social life of the University, and was elected Vice-President of the Union. Graduating M.B., Ch.M. with honours in September, 1915, he was appointed house surgeon at Sydney Hospital.

Early in 1916 he joined up, and served some time in Egypt before being invalided to England with pneumonia. He went to France later in the year, and after serving some months with a field ambulance on the Somme, was attached to a field artillery brigade. After several months of consistently fine work, he was awarded the Military Cross for conspicuous gallantry under most trying circumstances. During a serious attack he worked all day under heavy machine-gun and shell fire without cover, tending friend and foe alike, with absolute disregard for his own safety. He was killed at his guns. In the trenches, as in other walks of life, he set a standard of personal courage and cheerfulness under all conditions that gained him universal respect.

ARMY MEDICAL TRAINING IN AMERICA.—A correspondent writes from the Medical Officers' Training Camp, Fort Benjamin Harrison, Indiana: "We are getting a great amount of thorough instruction. The ground is gone over rapidly, possibly because of the shortness of time allowable before our services are needed. The men are buckling down, and almost without exception are earnest and patriotic in their work. It is a remarkable thing to see popular and successful physicians and surgeons giving up fine incomes and living in this great army training camp and putting up cheerfully with its lack of conveniences. There are some 1200 M.D.'s here now, besides line officers, all getting ready to go out to care for and train the hundred thousands of our new draft army."

THE NATIONAL WAR AIMS COMMITTEE'S LEAFLETS.—The National War Aims Committee has issued a series of leaflets of a very opportune sort. The first 15 are: (1) Prime Minister's Speech; (2) Interview with General Sir W. Robertson; (3) What Are We Fighting For?; (4) There Must Be No "Next Time"; (5) Winning the War; (6) The Nation Made War and the Nation Must Make the Peace; (7) The Truth About the War; (8) Labour and the War; (9) President Wilson on Peace Terms and War Aims; (10) The Kaiser Manner; (11) The Greatest and the Last Crusade; (12) "Gentlemen" of Germany; (13) Peace at Germany's Price?; (14) Right and Might: a Lesson which Germany Must be Made to Unlearn; (15) A Kalendar of "Kultur." Of these, No. 10, The Kaiser Manner, consisting of only one leaf, is perhaps the one which will attract most attention, as most of the other speeches have been read in the daily newspapers more than once. The reverse of this leaf contains a reproduction, by the special permission of the proprietors of *Punch*, of a drawing by Bernard Partridge, entitled the "Knightly Manner," and depicts the Kaiser in armour standing over the prostrate body of the female personification of Belgium, who says, "As long as there is motion in my body and life to give me words I'll cry for Justice," to which the Kaiser replies, "Justice shall never hear you, I am Justice." This is explained parenthetically by a reminder as follows: ("There is no longer any international law."—The Kaiser to Mr. Gerard.) This powerful picture will entice the observer into a reverie of right and wrong, and truth and fiction; it is founded on a passage in Beaumont and Fletcher.

Correspondence.

"Audi alteram partem."

A STATE-AIDED MIDWIFERY SERVICE.

To the Editor of THE LANCET.

SIR,—The time has arrived when the question of the midwifery service of the country merits consideration. The Act of 1902 was mainly the work of "those who claim that they are generally considered to be most competent to advise on such a subject"—namely, the Fellows of the Royal College of Physicians of London. The very large majority of the medical profession were, and are, only too well aware that the subject is in the main one of economics, and can never be settled by the establishment of a State-controlled body of nurses.

The result of legislation has been that districts which cannot support a midwife have remained unprovided for, although a bulky tome is annually issued which contains the names of thousands of women who are licensed to practise. Improvement can only be obtained by a process of decentralisation. The money which is now spent upon the operations of the Midwives Board should be devoted to work carried on by sanitary authorities, and that Board should be abolished. Sanitary authorities have now organisations for carrying on the work and are quite competent to decide upon the fitness of the women they employ, and they should be subsidised out of the money saved by the extinction of the Midwives Board.

The attempt to make a new class of midwifery practitioners has failed, and if the establishment of such a class is desired a sufficiently equipped class must be made and the subject of midwifery removed from the compulsory subjects of medical students. At the present time midwives do not occupy a position which is quite fair to them. They are not considered to be competent to carry out their work without the aid of stringent rules and regulations. They consequently have no responsibility so long as these rules are obeyed. Some are incompetent and others competent, and no rules will make those competent who are incompetent. If a sufficient class must be obtained it must be a class who are so competent that their work can be carried on without rules and regulations.

The repeal of the Act of 1902 is urgently required.

I am, Sir, yours faithfully,

Hatfield, Oct. 1st. 1917. LOVELL DRAGE.

*** Dr. Lovell Drage attributes much to Fellows of the Royal College of Physicians of London. The General Medical Council, after deliberations in which the representatives of all the medical faculties and corporations took part, suggested many changes in legislation in the Bill which later became law. The question to which he alludes has already become urgent, and we publish this week notes on the course taken in St. Pancras and at Chelmsford.—ED. L.

SACRO-ILIAC STRAIN.

To the Editor of THE LANCET.

SIR,—I beg permission to contribute a few observations on the annotation in your issue of Sept. 29th on the above-named condition. It is true indeed "a lesion which the general practitioner often sees but fails to recognise," but whether this is "because it has been described only in recent years, mainly by American orthopædic surgeons," is open to question. A much more potent reason is that it has not been accepted as a clinical entity by English surgeons at all. When I read a paper[1] on the subject, with numerous references to the literature and notes of nine cases, before the Orthopædic Section of the Royal Society of Medicine in 1913, it was greeted with buckets of cold water, the President cynically remarking that in all his experience he had never been fortunate enough to meet with a single case; and when I have tried to interest others in this condition I have been received with looks of blank incredulity. The condition, of course, undoubtedly exists, and the medical profession should be most grateful to you for making it known. Its dominant feature, however, is not pain over "the sacro-iliac point" in front, but

[1] See Transactions of the Royal Society of Medicine, vol. vii.

pain over the sacro-iliac joint behind. I have seen many cases now, but never one in which this sign was absent.

As regards treatment, does not your annotation present altogether too rosy a view? "Treatment is simple and gives most satisfactory results." I have found treatment most difficult and disappointing, having only been able to cure completely two cases. The keynote of the treatment is to compress the two halves of the pelvis together, but in actual practice this is not easy. Encircling strips of plaster applied tightly cause sores at their edges after one or two days, and have to be left off while the sores heal; belts have all proved unsatisfactory, while manipulation under an anæsthetic relieves for a time, only to be followed by a recurrence of the trouble. The best apparatus has proved to be an ordinary corset with reinforcing webbing bands around the pelvis.

Finally, as to nomenclature. For reasons I do not propose to enter into here, there are many objections to the term "sacro-iliac *strain*." These are all got over by describing the condition as "*painful* sacro-iliac joint."

I am, Sir, yours faithfully,

Harley-street, W., Sept. 29th, 1917. PAUL BERNARD ROTH.

A WAR MEMORIAL TO OLD EPSOMIANS.

To the Editor of THE LANCET.

SIR,—Two informal meetings of old Epsomians have been held regarding the question of raising a memorial to old Epsom boys who have fought and fallen in this war. It was decided that a meeting should be held at the offices of the College, 37, Soho-square, London, W., at 4 P.M., on Friday, Oct. 12th. It is hoped to get an expression of opinion at that meeting as to whether such a memorial should be raised, how it should be raised, and what form such a memorial should take. A treasurer and secretaries for this memorial fund will be appointed. The Rev. W. Barton, the headmaster of the school, and myself are acting as secretaries until the regular appointments are made. As addresses are so uncertain it has seemed desirable to notify old Epsom boys of this meeting through the newspapers. Will all who can come to the meeting, and will those who cannot come express their views in a letter addressed to me?

I am, Sir, yours faithfully,

EDRED M. CORNER.

7, Harley-street, London, W.1, Sept. 28th, 1917.

A CASE OF PERIODIC ATTACKS OF PYREXIA.

To the Editor of THE LANCET.

SIR,—The case recorded by Dr. R. V. Solly under the above heading in your issue of Sept. 8th (p. 386) has considerable resemblance to one of rat-bite fever. The regular pyrexial attacks with high temperature and "well" intervals, the erythematous eruption, the cessation of the disease after the administration of galyl, and the seven-weeks' duration before the pyrexial attacks began to become irregular, all coincide closely with the course of a case of rat-bite fever.

I am, Sir, yours faithfully,

R. TANNER HEWLETT, M.D. Lond.

Chandos-street, W.C., Sept. 24th, 1917.

"RECONSTRUCTION."

To the Editor of THE LANCET.

SIR,—I have read with great pleasure the leading article entitled "Reconstruction" in your issue of Sept. 15th, and warmly welcome the suggestion of the formation of a board such as you put forward to consider and interpret facts relating to professional reconstruction after the war. Since the outbreak of war there has been a tendency on the part of certain of those remaining at home to try to create a new Heaven and new earth, in the absence of their betters, with themselves as archangels. This tendency has resulted in a complete revolution of our political electorate, and now threatens an equally drastic change in our professional status. Apart from the impertinence, which surely is sometimes evident, it is also an injustice. During the last two years I have been in many parts of the world, and I can only say that amongst the hundreds of medical officers that I have met there exists a real mistrust as to our future status—a general feeling that our interests are being neglected and that our future is being decided overmuch by the "indispensables" and the "embusqués," who suffer from glib tongues and lately from overweighted pockets. I hope that others will give you their views on the matter, especially those connected with medical units serving abroad.

I am, Sir, yours faithfully,

A. HURRELL STYLE, M.A., M.D. Cantab.,
Temporary Captain, R.A.M.C.

Royal Societies Club, St. James's-street, S.W., Sept. 28th, 1917.

THE SERVICES.

ARMY MEDICAL SERVICE.

Temp. Col. F. M. Caird (Lieutenant-Colonel, R.A.M.C.T.F.) relinquishes his temporary rank on re-posting.

Temporary Lieutenant-Colonels to be temporary Colonels: Sir T. Myles, C.B., Sir W. A. Lane, C.B., J. Swain, C.B., Sir B. G. A. Moynihan, C.B., W. Taylor, A. Carless, Sir A. Chance, A. W. Mayo Robson, C.V.O., C.B., C. J. Symonds, C.B., C.M.G., T. H. Openshaw, C.B., C.M.G., W. Hunter, C.B., W. Aldren Turner, C.B., H. M. Davy, C.B.

Honorary Lieutenant-Colonels to be temporary Honorary Colonels: J. L. Thomas, C.B., C.M.G., J. F. O'Carroll.

ROYAL ARMY MEDICAL CORPS.

Major A. N. Fraser, D.S.O., to be temporary Lieutenant-Colonel whilst commanding a Training Centre.

Temp. Major R. Davies-Colley to be temporary Lieutenant-Colonel whilst specially employed.

Major (Bt. Lieut.-Col.) H. J. Crossley to be acting Lieutenant-Colonel whilst in command of a Stationary Hospital.

Major (Bt. Lieut.-Col.) H. J. Crossley relinquishes the rank of acting Lieutenant-Colonel on re-posting.

Major (Bt. Lieut.-Col.) C. R. S. Bradley relinquishes the rank of temporary Lieutenant-Colonel on ceasing to command a Training Centre.

Temp. Capt. E. P. G. Causton to be temporary Major.

H. H. K. Sparrow and P. A. Sullivan, late temporary Captains, to be honorary Captains.

Temp. Lieuts. to be temporary Captains: H. McLean, R. A. Campbell, R. A. MacNeill, G. H. Fraser, J. M. Johnstone, J. J. Moriarty, T. T. B. Watson, T. H. Jackson, J. A. Noble, J. H. Sharpe, W. E. Hodgins, A. S. Carter, T. Jones, A. H. Davies, R. H. Stoddard, E. E. T. Nuthall, F. P. Wigfield, F. Stevenson, J. McN. Murray, V. E. Somerset, J. C. M. Bailey, R. K. G. Graves, F. Newey, N. N. Haysom, E. G. Howell, C. H. Comerford, R. J. MacKessack, P. Pollard, J. A. Renshaw, A. H. H. Howard, D. G. S. Gartshore, L. C. Blackstone, C. S. U. Rippon, H. D. Stewart, A. Fothergill, H. V. Taylor, J. G. Johnstone, M. C. Stark, C. D. Day, J. W. Steel, R. W. Annison, K. H. Stokes, W. A. Simpson, J. Warnock, J. E. P. Shera, N. C. Lake, C. F. Graves, A. S. Holden, A. H. Burnett, C. C. Morgan, N. Davidson, A. C. Craighead, T. L. Henderson, A. Kerr, W. C. Fraser, K. McLay, W. W. Johns, W. S. Angus, H. G. E. Williams, J. B. Whitfield, J. M. Jarvie, F. W. Murray, R. J. Wilson, J. D. Judson, W. R. Wiseman, D. G. C. Tasker, G. E. A. Petrie, H. F. Woods, A. Duguid, R. S. Barker, W. L. Johnson, F. W. Grant, C. Tylor, P. Henderson, G. A. Lyons, T. D. H. Holmes, T. Jackson, H. S. Banks, F. G. Bergin.

To be temporary honorary Lieutenants: B. E. Hawke and C. H. Evans.

Officers relinquishing their commissions: Temp. Major W. D. Knocker (on account of ill-health); Temp. Capts. F. W. Lyle (granted the honorary rank of Captain), H. de C. Dillon (on acount of ill-health contracted on active service; granted the honorary rank of Captain), M. A'B. McCarthy (granted the honorary rank of Captain), J. Brunton, N. Grace, S. G. Vinter, C. H. Brookes, J. S. S. Perkins, A. H. H. Sinclair, W. J. Hicks, W. J. Gow, C. D. Pile, F. C. Drew, A. S. Anderson, A. G. Watson. Temporary Lieutenants: P. E. Howie (on account of ill-health), A. T. Thurston, R. Lee, R. Jones, D. Penman, G. Holman, J. Mellor, W. S. Kidd, H. W. Heasman, N. F. Stallard, W. H. Gray, J. R. Kerr, J. Loftus, A. F. Martin, M. Waldron, J. S. F. Weir, J. Findlay, R. S. Doran, C. H. Houghton, H. Nicol, R. H. Jamieson, T. H. Underhill, T. A. Matthews, J. M. Hall, E. J. Fitzgerald, H. G. Ramsbottom, W. R. Bramley-Moore, H. A. Fenton, S. J. Yeates, J. H. C. Thompson, S. J. Moore, W. S. McDougall, J. T. Bailey, W. McM. Millar, H. H. Riley, E. G. Fearnsides, T. G. Maitland, J. E. Richards, G. F. Longbotham, J. B. McCutcheon, J. D. S. Sinclair, W. Garstang, J. R. Frost, E. W. Atkinson, G. R. Hughes, J. R. Micallef, A. Kinsey-Morgan.

SPECIAL RESERVE OF OFFICERS.

Second Lieut. S. Riddiough, from Unattached List, T.F., to be Lieutenant.

TERRITORIAL FORCE.

Major (temp. Lieut.-Col.) E. H. Cox relinquishes his temporary rank on ceasing to command a Field Ambulance.

Capt. C. E. Silvester to be Major.

Capts. T. M. Jamieson and E. H. E. Stack are restored to the establishment.

Capt. (temp. Major) W. B. Secretan relinquishes his temporary rank on alteration in posting and is restored to the establishment.

Capts. H. N. Fletcher and F. A. S. Hutchinson are seconded for duty with a General Hospital.

Capt. J. D. Holmes is restored to the establishment.

Second Lieut. C. P. Matthews, from East Surrey Regiment, to be Lieutenant.

F. Isdell to be temporary Lieutenant and Medical Officer, 4th Battalion, Essex Volunteer Regiment.

JAPANESE ORDER.

The Order of the Sacred Treasure of the First Class has been conferred on Surg.-Gen. Sir Arthur William May, K.C.B., K.H.P., by the Emperor of Japan.

Medical News.

VICTORIA UNIVERSITY OF MANCHESTER.—At the First M.B. and Ch.B. examination, held recently, the following candidates were successful:—

Part I., Inorganic Chemistry and Physics.—R. S. van Aalten, O. A. Akjaly, Nancy E. Beakley, Caroline M. Edwardes-Evans, T. N. Fisher, Kath. M. Fullerton, Ruth Hill, C. D. Hough, Jessie Kilroe R. R. Lane, W. L. Martland, A. C. Newman, El. S. El. G. Sheir, Mary I. Turner, and Leo Unsworth.

Part II., Biology.—O. A. Akjaly, Cath. M. E. S. Chapman, and Emmeline Wade.

Chemistry.—Cath. M. E. S. Chapman and Emmeline Wade.

MEDICAL SOCIETY OF LONDON.—The programme of the first half of the session 1917–18 has now been issued. The annual meeting, as announced, will take place on Oct. 8th, at 8 P.M. The address of the President, Sir StClair Thomson, on "The Founder and the Foundation of the Medical Society," will be delivered at 8.30, and will be followed by a discussion on "War Bread and its Effect on Health," to be introduced by Dr. Robert Hutchison and Dr. E. I. Spriggs. On Oct. 22nd a discussion on "Modern Artificial Limbs and their Influence upon Methods of Amputation" will be introduced by Mr. Muirhead Little and Captain R. C. Elmslie, R.A.M.C. (T.). On Oct. 29th a paper will be read on "Experiences in the Use of Nitrous Oxide and Oxygen with Regulated Rebreathing in Military Surgery at the First London General Hospital," by Captain H. Edmund G. Boyle, R.A.M.C. (T.). On Nov. 12th and 19th there will be a discussion on "The Value and Limitations of Sanatorium Treatment for Tuberculosis," in which Dr. T. D. Lister, Dr. David Lawson, Dr. Noel Bardswell, and Dr. Wilfred O. Meek will take part. On Dec. 3rd a discussion on "Surgical and Dental Treatment of Severe Facial Injuries" will be introduced by Major H. D. Gillies, R.A.M.C., Captain Kelsey Frey, R.A.M.C. (T.), and Mr. Percival Cole. All the ordinary meetings will be held at 8.30 P.M. The Lettsomian lectures on "Jaundice" will be delivered in the spring of 1918 by Colonel William H. Willcox, C.B., C.M.G. The annual Oration will be delivered by Colonel Charles A. Ballance, C.B., M.V.O., in May, 1918. The syllabus for the second half of the session will be published early in January, and Fellows desirous of reading papers should communicate with Mr. Hugh Lett, the senior honorary secretary, at 11, Chandos-street, Cavendish-square, W.1.

NORTH-EAST LONDON POST-GRADUATE COLLEGE.—A series of demonstrations has been arranged for the winter session, 1917, at the Prince of Wales's Hospital, Tottenham, to which all medical men are invited. The subjects are as follow: Nov. 6th, Mr. C. H. Hayton, Nose, Ear, and Throat Disease; Nov. 13th, Mr. J. Howell Evans, Abdominal Injuries; Nov. 19th, Dr. T. R. Whipham, Children's Diseases; Nov. 27th, Dr. A. J. Whiting, Medical Cases; Dec. 5th, Mr. T. H. C. Benians, Disease Carriers. The time in each case is 3.30 P.M.

KING EDWARD'S HOSPITAL FUND FOR LONDON: STATISTICAL REPORT.—The need for and benefits of economy which the nation is now realising, owing to the exigence of war, have for several years been thoroughly recognised by all who are interested in the welfare of our great healing institutions, and since the advent of King Edward's Hospital Fund for London the economy of hospital administration redounds to the credit of all concerned. With the object of assisting hospital managers and others in controlling expenditure the King's Fund, as our readers know, issues an annual statistical report, and that for the year 1916 (the fourteenth), dealing with the ordinary expenditure of 69 London hospitals, which has just been issued, clearly demonstrates the need for support and the worthiness of these institutions for the sick poor and for the healing of our sailors and soldiers. In 1916 the total number of beds in average daily occupation was 11,406, while the total number of in-patients admitted was 153,512 and the number of out-patients attended 1,251,019. Of the in-patients 27,328 were naval and military patients treated by understanding with the authorities, and the 2855 beds thus occupied represented 25 per cent. of the total average occupied beds. The total average number of occupied beds was raised from 9766 in 1913 to 11,406 in 1916, an increase of 1640 beds, from which it follows that 1215 of the number of beds occupied by the naval and military patients were taken from those previously used by civilians, the remaining 1640 beds for war patients being provided for by an increase in the total accommodation at the hospitals. The total ordinary expenditure during the year, including maintenance, administration, rent, rates, and taxes, but excluding capital expenditure, interest on borrowed money, and contributions to the maintenance of convalescent homes and country branches, amounted to £1,513,834. The receipts from the authorities in aid of naval and military patients was £218,087. Comparing the year 1916 with 1915 the increased expenditure borne by the hospitals amounted to £104,540, or 8·77 per cent., caused almost entirely by the rise in cost of all items of maintenance. As is pointed out by the secretaries of the Fund, "the increase in total work, with the consequent increase in total expenditure, constitutes an enlarged demand upon the voluntary subscriptions of the charitable public, and renders more than ever important the grants made by this Fund and by the Hospital Sunday and Saturday Funds." The report can be obtained from Messrs. Spottiswoode, Ballantyne, and Co., 1, New Street-square, E.C. 4, price 1*s.* net, or 1*s.* 2*d.* post free.

MEDICO-LEGAL SOCIETY: SESSION 1917–1918.—A meeting will be held at 11, Chandos-street, Cavendish-square, W., on Tuesday, Oct. 16th, at 8.30 P.M., the Right Hon. Sir Samuel Evans, president of the society, in the chair. After the presidential address a discussion will take place on the Criminal Law Amendment Bill (1917), introduced by Dr. F. J. Smith. Members desirous of participating in the discussion should communicate their names to Dr. F. G. Crookshank, 15, Harley-street, W.1, the senior honorary secretary, before the meeting. The presence of visitors interested in the subject will be welcomed.

PRESENTATION TO A MEDICAL MAN.—Mr. James Munce, medical officer of Drumbeg Dispensary, co. Down, was on Sept. 28th, at Hillhall schoolhouse, presented with a packet of Treasury notes and a gold pin, and his wife with a piano, as indications of personal appreciation on the part of a wide circle of patients and friends, the occasion of the presentation being the doctor's recovery from a severe illness.

DOCTORS CALLED IN BY MIDWIVES.—The St. Pancras borough council proposes for an experimental period of one year to make payments to medical practitioners when called in by midwives in cases of emergency upon the statement of the medical practitioner that the patient is in his opinion unable to pay. Subject to its being accepted by the local branch of the British Medical Association the scale of payment to the medical practitioners will be fixed as follows: 1 guinea for a normal confinement and 2 guineas for a confinement presenting special difficulty or requiring operative interference, including in each case the necessary subsequent attendances, and for calls not for the confinement itself, but before or after confinement 5*s.* for the first visit (10*s.* 6*d.* if between 9 P.M. and 9 A.M.) and 2*s.* 6*d.* for each subsequent visit. In his report on the subject Dr. T. Shadick Higgins, the medical officer of health of the borough, says that for the avoidance of payment from public funds in cases where it could be made by the patient, the scheme would depend upon the doctors refraining from asking for fees from the council in such cases; but for the success of the scheme it is essential that the doctors should be assured of payment by the council if they render an account with a statement of their opinion of the inability of the patient to pay. The scale of payment set out above can be taken as a basis, but before a scheme is adopted it would be necessary to get not only the concurrence of the local practitioners but also the approval of the Local Government Board.

URBAN VITAL STATISTICS.

(Week ended Sept. 29th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was 10·8, against 10·6 and 11·1 per 1000 in the two preceding weeks. In London, with a population exceeding 4,000,000 persons, the death-rate was 11·2, or 0·1 per 1000 above that recorded in the previous week; among the remaining towns the death-rates ranged from 4·1 in Aberdare, 4·4 in Enfield, and 5·0 in Dewsbury, to 15·8 in Newport (Mon.), 16·2 in Acton and in Rochdale, and 17·3 in Tynemouth. The principal epidemic diseases caused 397 deaths, which corresponded to an annual rate of 1·2 per 1000, and included 267 from infantile diarrhœa, 47 from whooping-cough, 35 from diphtheria, 29 from measles, 14 from enteric fever, and 5 from scarlet fever. The deaths from diarrhœa, which had been 320, 262, and 344 in the three preceding weeks, declined to 267, and included 55 in London, 19 in Liverpool, 16 in Hull, 15 in in Sheffield, and 11 in Sunderland. The 816 cases of scarlet fever and 1123 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 84 and 41 above the numbers remaining at the end of the previous week. Of the deaths from all causes in the 96 towns, 146 resulted from violence. The causes of 16 deaths were uncertified, of which 4 were registered in Liverpool and 2 each in Birmingham and Gateshead.

Scotch Towns.—In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual rate of mortality was equal to 11·9, against 10·8 and 11·6 per 1000 in the two preceding weeks. The 256 deaths in Glasgow corresponded to an annual rate of 12·0 per 1000, and included 13 from infantile diarrhœa, 5 from whooping-cough, and 2 from diphtheria. The 85 deaths in Edinburgh were equal to a rate of 13·4 per 1000, and included 3 from whooping-cough and 1 from diphtheria.

Irish Towns.—The 96 deaths in Dublin corresponded to an annual rate of 12·5, or 4·1 per 1000 below that recorded in the previous week, and included 16 from diarrhœa, 2 each from whooping-cough and diphtheria, and 1 from enteric fever. The 81 deaths in Belfast were equal to a rate of 10·7 per 1000, and included 2 from diarrhœa.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.*

HICHENS, F., M.D. Lond., has been reappointed Medical Officer for Stythians by the Redruth Board of Guardians.

MEACHEN, G. N., M.D., B.S. Lond., has been appointed Tuberculosis Officer for the Saffron Walden and Braintree District of Essex.

SIMPSON, S., M.B., B.Ch. Dub., District Medical Officer and Public Vaccinator for the parish of Llanelly, Brecon.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).
When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

BETHNAL GREEN, METROPOLITAN BOROUGH OF.—Female Assistant Medical Officer of Health. Salary £400 per annum.

BIRKENHEAD BOROUGH HOSPITAL.—Junior House Surgeon. Salary £175 per annum, with board, &c.

BOLINGBROKE HOSPITAL, Wandsworth Common, S.W.—Resident Medical Officer and House Surgeon. Salary £200 and £150 per annum respectively each, with board, &c.

BRISTOL ROYAL INFIRMARY.—House Physician and House Surgeon. Salary at rate of £120 per annum, with board, &c.

BURY INFIRMARY.—Junior House Surgeon. Salary £150 per annum, with board, &c.

CAMBRIDGE, ADDENBROOKE'S HOSPITAL.—House Surgeon and House Physician. Salary at rate of £300 per annum each, with board, &c.

CHARING CROSS HOSPITAL.—Medical Registrar. Salary £60 per annum, with lunch and tea.

COLMONELL PARISH, LOWER DISTRICT OF.—Medical Officer. Salary £70 per annum. Vaccination salary £2 per annum.

DERBY, DERBYSHIRE ROYAL INFIRMARY.—Resident Surgical Officer.

KENSINGTON BOARD OF GUARDIANS.—Resident Medical Superintendent for Marloes-road Institutions. Salary £650 per annum, with use of house, &c.

LIVERPOOL INFIRMARY FOR CHILDREN.—Two Resident House Physicians for six months. Salary at rate of £90 per annum each, with board, &c.

LONDON TEMPERANCE HOSPITAL, Hampstead-road, N.W.—Assistant Resident Medical Officer. Salary £120 per annum, with board, &c.

NEW HOSPITAL FOR WOMEN, Euston-road.—Female Resident Medical Officer at House of Recovery, New Barnet. Salary £60 per annum, with board, &c.

NOTTINGHAM GENERAL HOSPITAL.—Female House Surgeon for six months. Salary at rate of £250 per annum, with board, &c.

NOTTINGHAM AND MIDLAND EYE INFIRMARY.—Female House Surgeon. Salary £200 to £250 per annum, with board, &c.

OLDHAM ROYAL INFIRMARY.—Third House Surgeon. Salary £225 per annum, with board, &c.

OXFORD EYE HOSPITAL.—Resident House Surgeon.

PORTSMOUTH BOROUGH MENTAL HOSPITAL.—Locum Tenens Assistant Medical Officer. Salary 7 guineas per week, with board, &c.

PRINCE OF WALES'S GENERAL HOSPITAL, Tottenham, N.—Senior House Surgeon. Salary at rate of 7 guineas per week, with board, &c.

QUEEN'S HOSPITAL FOR CHILDREN, Hackney-road, Bethnal Green, E.—House Physician, Casualty House Surgeon, and House Surgeon for six months. Salary £100 per annum, with board, &c.

ROYAL NATIONAL ORTHOPÆDIC HOSPITAL, 234, Great Portland-street, W.—Resident House Surgeon. Salary £100 per annum, with board, &c.

SALISBURY GENERAL INFIRMARY.—House Surgeon. Salary £150 per annum, with board, &c.

SHEFFIELD ROYAL INFIRMARY.—Casualty Officer for six months. Salary £150 per annum, with board, &c.

SOUTHAMPTON, FREE EYE HOSPITAL.—House Surgeon. Salary £100 per annum, with board, &c.

SOUTHAMPTON, ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL.—House Physician.

WALSALL AND DISTRICT HOSPITAL.—Female Assistant House Surgeon and Anæsthetist. Salary £175 per annum, with board, &c.

WALSALL EDUCATION COMMITTEE.—Temporary School Medical Inspector. Salary at rate of £400 per annum.

WEST BROMWICH DISTRICT HOSPITAL.—Senior House Surgeon, unmarried. Salary £160 per annum, with board, &c.

WHITEHAVEN TOWN COUNCIL AND RURAL DISTRICT COUNCIL.—Medical Officer of Health. Salary £500 per annum.

WINCHESTER, HAMPSHIRE COUNTY COUNCIL.—Temporary Assistant County Medical Officer of Health. Salary £400 per annum.

THE Chief Inspector of Factories, Home Office, London, S.W., gives notice of vacancies for Certifying Surgeons under the Factory and Workshop Acts at Hastings (Sussex) and at Cleator (Cumberland).

Births, Marriages, and Deaths.

BIRTHS.

HUTCHINSON.—On Sept. 26th, at Lower King's-road, Kingston-on-Thames, the wife of Major E. L. Hutchinson, A.A.M.C., of a daughter.

ROSS HADDON.—On Sept. 25th, at Overstrand-mansions, S.W., the wife of Captain D. A. Ross Haddon, M.C., R.A.M.C., of a daughter.

WARREN.—On Sept. 22nd, at Arden Cottage, Greenford-gardens, Greenford, Southall, to Captain and Mrs. Richard Warren, of 23, Wimpole-street, W.—a daughter.

MARRIAGES.

ARMOUR—JOHNSTON.—On Sept. 27th, at St. Luke's Church, Liverpool, T. Armour, M.B., F.R.C.S. Ed., Captain, R.A.M.C., T.F., to Margaret Johnston, daughter of the late Mr. H. Johnston.

HILTON JONES—DAVIES BRYAN.—On Sept. 25th, at Engedi C.M. Chapel, Carnarvon, Captain R. Orthin Hilton Jones, M.C., R.A.M.C., to Olwen, only child of Mr. and Mrs. Edward Davies Bryan, of Cairo, Egypt, and Carnarvon.

PARKINSON—LE BROCQ.—On Sept. 29th, at St. Michael's Church, Southampton, John Parkinson, M.D., M.R.C.P., Temporary Captain, R.A.M.C., to Clara Elvina Le Brocq, late Sister Q.A.I.M.N.S.R.

DEATHS.

BULL.—On Sept. 16th, killed in action, Captain B. A. Bull, R.A.M.C., attached London Regiment.

HARDIE.—On Sept. 20th, died of wounds, Captain F. Hardie, R.A.M.C. (T.).

ROBERTS.—On Sept 27th, Arthur Milson Roberts, M.D., aged 69.

WALKER.—On Sept. 30th, at Edgbaston, R. P. Walker, M.R.C.S. Eng., L.S.A., in his 84th year.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL.—The two Goldsmid Entrance Exhibitions, offered annually for competition in September, were awarded this year to Mr. H. L. Heimann and Mr. V. R. Khanolkar, both of University College, London.

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY.—A course of lectures on Tropical Hygiene will be given by Mr. H. G. Plimmer, F.R.S., professor of comparative pathology, in the lecture-room of the Botany Department of the College, Prince Consort-road, South Kensington, London, S.W., on Tuesdays from 4–5 P.M., during the first half of the session 1917–18, beginning on Oct. 9th. The course is intended for officers in H.M. Forces who are likely to be sent to hot countries, and will deal with infectious diseases, their causation and prevention; advice as to the maintenance of health in tropics; and the treatment of minor complaints and injuries. The fee for the course is £1. Application to the Registrar of the Imperial College.

Notes, Short Comments, and Answers to Correspondents.

GILBERT AND ELLICE ISLANDS.

A REPORT recently presented to Parliament on these two groups of islands in the Pacific—formerly constituting a Protectorate, but formally annexed to the Empire in 1915—contains some interesting references to the health and medical administration of the territory. The Gilbert group, situated between 4° N. and 3° S. latitude and 172° and 177° W. longitude, consists of 16 islands, with several smaller islands or islets depending upon them; and the Ellice group, between 5° S. and 10½° S. latitude and 176° E. and 179·58° W. longitude, consists of nine islands (in which Ocean Island, or Paanopa, is included). The total area of the two groups is only 180 square miles, and the population, according to the Census of 1911, comprised 30,523 natives, 301 Asiatics, and 297 Europeans. The births recorded in 1915–16 totalled 959 and the deaths 726.

In the Gilbert Islands a serious epidemic of influenza carried off many old people and weaklings in 1914-15, but the figures for 1913-14 and 1915-16 were most satisfactory in view of the fact that for many years previously the population of the islands was decreasing to such an extent that it was predicted that the race would soon be exterminated owing to contact with civilisation. It is true that the white man introduced syphilis and was probably responsible for the scourge of tuberculosis, but medical science is using every effort to restore the balance and to bring relief and improved health to these simple and kindly folk. During the past three years the expenditure on the medical department has been very largely increased. There was a time when sickness was hidden and when medical inspection visits were feared. In 1913-14 a determined effort was first made to put the medical department on a sound footing. It was realised that this result could not be achieved by the importation of medical skill only; it was essential to catch and to hold the interest and confidence of their own people, to demonstrate that the power to alleviate and to heal could be learnt by their kith and kin, and that operations were not hazardous miracles to be performed in secret under the white man's spell. It is already evident from statistics that some measure of success is being attained. In spite of the difficulty of transport due to the need of a Government vessel and to the curtailment of the trading steamer service in war-time, the number of cases admitted into the hospitals and the operations performed are proof that these people have realised what medical attention can do for them.

The results of the treatment of yaws by salvarsan, or by its equivalent galyl or kharsivan, confirm the reports from the West Indies and elsewhere. The native name given to this drug is "Te Iti" or "lightning," from the marvellous rapidity of the cure. Satisfactory results have also been obtained by the use of this drug in cases of syphilis, which is prevalent still in the groups; this, however, is naturally a slower process, especially in its advanced stages. It is, unfortunately, still difficult to get the patient to realise the gravity of this disease in the early stages. The need for a plentiful supply of galyl or kharsivan cannot be too earnestly insisted on. In cases of elephantiasis, prevalent in several of the islands, kharsivan has also been used with good results.

The treatment of tuberculosis, the greatest scourge of the colony, is a matter which calls for the patience and perseverance of those on the spot. Tuberculin may be used in surgical cases, but the various precautionary measures do not appeal to the careless, easy-going native. Tuberculosis is believed to have been originated amongst these people by the wearing of European dress, which led to the discontinuance of the practice of oiling the bodies, which was formerly done as soon as the cold westerly winds set in with heavy rains. Though efforts have been made to persuade the natives to revert to their native dress and to the lubrication of the body, it is feared that the attempt has been made too late. It is natural that the traders are averse to this, since probably 50 per cent. of the money which they pay out for produce comes back to them from the sale of tropical clothing to natives. The missions also have shown no wish to help this movement. "Shirts and trousers for men, and the long-sweeping garment for women, are the outward signs of Christianity; it is practically only among pagans and in the Government gaols that the sensible native dress may now be seen."

The headquarters of the medical staff are at Tarawa, with branch European-run hospitals at Tabiteanea in the Central Gilberts and at Funafuti in the Ellice group. The institution of a training school for native medical students at Tarawa has proved a great boon to the colony. The natives have come forward readily for instruction, and every island is now in charge of a medical dresser of fair experience. As opportunities of relief offer these dressers return to the Central Hospital for a further period of instruction, and the standard of efficiency is gradually raised throughout the native hospitals. During the year 1175 cases were admitted to the Tarawa Central Hospital and 619 operations were performed. At the Funafuti hospital 555 cases were admitted and 180 operations performed. Since November, 1915, the European medical staff has again been reduced to one; this officer is, however, ably assisted by two native medical practitioners, to one of whom (Sowani) the colony is indebted for many years of most faithful and efficient service. The services of a white matron have now been acquired for the Tarawa hospital, and a scheme for the training of half-caste girls as maternity nurses has been started. During the year a white ward for the treatment of European patients has been opened and has already proved useful.

The erection and equipment of a leper asylum upon an isolated islet awaits acquisition of a Government vessel for the collection of cases. Each island is at present equipped with its own asylum, but there is always danger of contact or intercourse, and this scourge cannot be wiped out until a central isolated asylum can be constructed and maintained with the assistance of a Government vessel.

THE SUPER-HEN.

To the Editor of THE LANCET.

SIR,—Amongst some eggs which I bought last week there was one which was rather large, and which I voted was the progeny of a goose and included in my purchase by mistake. On cracking it it yielded two fine yelks. I used to look after a number of hens for several years and collect their eggs and cook a good many, but although I have seen some curious specimens of twisted and fantastic-shaped shells, and of shell-less eggs, I have not met with one before having two yelks.

I have had the curiosity since to look for information in your columns. In THE LANCET of Sept. 26th, 1885, there is an account of a hen's egg with two shells, one inside the other; and in the issue of Dec. 5th, 1885, a letter describes an egg with two shells, each shell when broken yielding yelk and white; and in that of Oct. 17th, 1885, a correspondent wrote that his medical partner had a similar egg and requested Professor Huxley's opinion on it. "It is very simple," said Huxley, "reversed peristaltic action takes place in the oviduct after the shell is formed; the egg is driven back, and when again descending gets a coating of yelk, albumen, and shell." But I do not see any record of a double yelk mentioned.—I am, Sir, yours faithfully,

Oct. 3rd, 1917. A READER.

A CORRECTION.

To the Editor of THE LANCET.

SIR,—May I correct a statement in your reviewer's extremely considerate remarks upon the last edition of my little book on anæsthetics? Anoci-association is not omitted, as he states, but is briefly described in the pages headed "Nitrous Oxide and Oxygen in Major Surgery." But the word does not occur in the index.

I am, Sir, yours faithfully,

Harley-street, Oct. 2nd, 1917. J. BLOMFIELD.

Medical Diary for the ensuing Week.

SOCIETIES.

MEDICAL SOCIETY OF LONDON, 11, Chandos-st., Cavendish-sq., W.

MONDAY.—8 P.M., Annual General Meeting. 8.30 P.M., Presidential Address:—Sir StClair Thomson: The Founder and Foundation of the Medical Society. Discussion on War Bread and its Effects on Health (introduced by Dr. R. Hutchison and Dr. E. I. Spriggs).

EDITORIAL NOTICES.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.*

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

Offices: 423, STRAND, LONDON, W.C. 2.

MANAGER'S NOTICES.

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, London, W.C. 2, are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and not to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION is published in time to catch the weekly Friday mails to all parts of the world.

TO COLONIAL AND FOREIGN SUBSCRIBERS.

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 4.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

Communications, Letters, &c., have been received from—

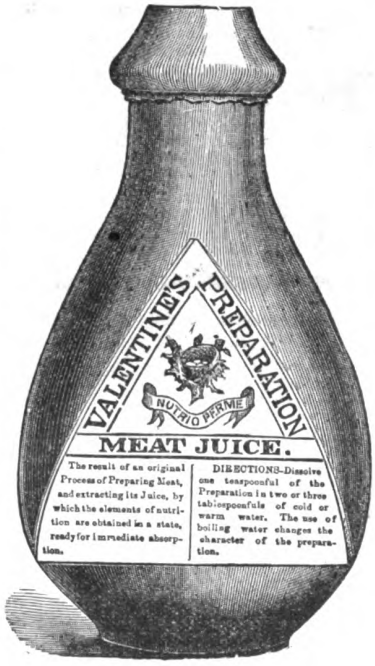
Valentine's Meat-Juice



In **Typhoid, Gastric** and **Other Fevers** where it is **Essential** to **Sustain** the **Patient** without Irritating the **Weakened Digestive Organs, Valentine's Meat-Juice** demonstrates its **Ease** of **Assimilation** and **Power** of **Sustaining** and **Strengthening** when **Other Food Fails.**

Fever Cases

S. R. Nissley, M.D., *Elizabethtown, Pa, U.S.A.*: "In the recent epidemic of Typhoid Fever that prevailed in this locality, I had an excellent opportunity of testing the nutritious elements of Valentine's Meat-Juice. In one particular case where there was stiffness in the jaws rendering deglutition difficult, from the onslaught of the malady, I sustained life by the administration of Valentine's Meat-Juice beyond a fortnight. In all cases where I used the Meat-Juice, it surpassed my most sanguine expectations, and I may add that the elegance of the preparation is vastly enhanced by the retention of the original bovine flavor of the beef. It is the best preparation of meat that I have used in my practice, and I have no hesitation in saying that it is borne with impunity by the most delicate stomach and will be found to be an invaluable adjunct to the list of our therapeutic agents."

Dr. Gervasio de Gobeo, *Physician to the Asylum, Bilbao, Spain:* "I have tried Valentine's Meat-Juice on two patients convalescing from Typhoid Fever. They were in a most exhausted condition, owing to the fact that their digestive organs would admit no other class of nourishment excepting milk. I ordered and gave them Valentine's Meat-Juice, which their stomachs retained perfectly, and they immediately commenced regaining their strength."

J. R. Wood, M.D., *Physician, Sheltering Arms Hospital, Paint Creek, W. Va., U.S.A.*: "I have been using Valentine's Meat-Juice in the treatment of Typhoid Fever cases in the Sheltering Arms Hospital, for the last two or three weeks, with the most gratifying results both to the patient and physician. I consider it the best preparation of animal food I have ever seen, in fact, the only one I have ever had any success with."

For Sale by European and American Chemists and Druggists.

VALENTINE'S MEAT-JUICE COMPANY,
Richmond, Virginia, U. S. A.

At all times Pure Wool

You can safely recommend Wolsey as the Pure Wool Underwear. Before the War Wolsey was pure wool—in spite of the increased price to-day Wolsey is still pure wool—and in future times of peace Wolsey will be pure wool.

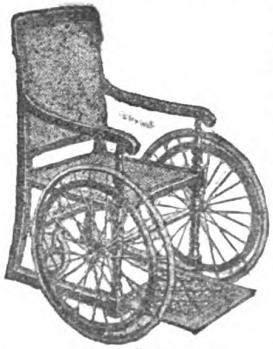
Every garment made from new and carefully-selected wool and manufactured by British labour under hygienic conditions. The underwear for great comfort and long service.

Wolsey

Pure Wool Underwear

For men, women, and children. Guaranteed unshrinkable or replaced free of cost. The Wolsey Trade Mark is on every garment

The manufacturers of Wolsey will be glad to show any Doctor over their factories if he should be in Leicester. A postcard will ensure arrangements being made to receive him.



THE WOLSEY UNDERWEAR CO.,
LEICESTER.

By Special Appointment to H.M. THE KING.

W. H. BAILEY & SON

38, OXFORD ST., & 2, RATHBONE PLACE, W.1

MADE IN AUSTRALIA

"EUMENTHOL" TOOTH POWDER

(HUDSON)

A fragrant, palatable, non-toxic, non-irritant germicidal powder, being a combination of Formalin, Menthol, &c., with a diatomaceous earth in conjunction with a pure high-grade peroxide (MgO_2). The Menthol is in chemical combination with Formalin to form the new antiseptic compound, Dimenthol-Formal, CH_2 ($C_{10}H_{19}O_2$) M.P. 56, 5°C. (Brochet), and unites an antiseptic action twice more powerful than Sublimate, with a very decided effect in hardening the Gums. A strength of 1 in 1000 kills all the salivary bacilli in less than two hours. Dessirier recommends Dimenthol-Formal for the treatment of aphthæ.

"Eumenthol" Tooth Powder on dissociation (in contact with water or the Oral Fluids) liberates free active Oxygen, and Hydroxide of Magnesia in a minutely divided state is produced.

THE LANCET states: "This Tooth Powder is designed on sound principles and is very agreeable to use. The distinctive feature about it is that, in addition to some approved germicides, it contains MgO_2, which readily parts with free oxygen, as our experiments have shown."

Nights . . . in the Sick Room

ANXIOUS hours are the night hours in the sick room. Hours of patient watching and of vigilance.

At such a time nothing can be so companionable as a restful, steady light. But it should be a light that needs no tending: a soft light that has no glare.

Such a light—large or small, according to the variety chosen—may be secured by the use of

Price's Night Lights

ROYAL CASTLE or CHILDS' *For Small Light*

PALMITINE STAR *For Medium Light*

93 Awards.

CLARKE'S PYRAMIDS
For Large Light and Heat.

From a health point of view, Price's Night Lights have everything to commend them. They do not vitiate the atmosphere. They are clean to handle and to use, whilst their light has just that unobtrusiveness so essential in the illumination of sick room and nursery.

Sold Everywhere.

PRICE'S PATENT CANDLE COMPANY Limited,
BATTERSEA, LONDON, S.W. 11.

KEROL

KEROL combines all the properties which go to the making of an ideal preparation.

It has been shown to be practically non-toxic, non-irritant and non-corrosive—a combination of properties which make it the one preparation which can be used with perfect confidence wherever the use of either a disinfectant or antiseptic is indicated. It is of high and definite germicidal value and is perfectly homogeneous

KEROL is highly recommended by Bacteriologists and by prominent members of the Medical Profession.

KEROL CAPSULES

INTESTINAL. *These are of great value where intestinal antisepsis is indicated. In a comparatively short space of time the coli content of the intestine is reduced by over 99 per cent. They are non-irritant and perfectly safe.*

STOMACHIC. *For use in cases of stomach fermentation and other gastric troubles, and are of great value in reducing the number of malign organisms prior to administration of treatment with lactic ferments, i.e., sour milk, etc.*

Samples and literature sent free to any Medical Practitioner

QUIBELL BROS. LTD

NEWARK

BLENOSAN
CAPSULES

As a routine
treatment for

GONORRHŒA

BLENOSAN is a mixture of the finest East India Santal Oil with a specially prepared fluid extract of Kava-Kava. It is presented in the form of accurately-measured Capsules, and affords an ideal medicament for the treatment of all inflammatory conditions of the urethra.

BLENOSAN is an improvement upon the ordinary Santal, and the full proportion of the alpha resin of Kava-Kava ensures all the anæsthetic and diuretic properties of the root in a standardised and dependable form.

BLENOSAN CAPSULES consequently are indicated in all pathological conditions which affect the genito-urinary system, including acute Cystitis, Vaginitis, and Leucorrhœa, and where intense hyperæmia and swelling of the mucous membrane give rise to a diminution of the urinary canal.

BLENOSAN CAPSULES are well adapted for the continuous and systematic treatment of such cases, and are being used with excellent results by many of the most experienced and successful Physicians.

BLENOSAN CAPSULES can be prescribed for a course of treatment extending over two or three weeks, without necessitating constant supervision on the part of the Physician.

ASTHMA,

CHRONIC BRONCHITIS, BRONCHITIS, ASTHMA, HAY FEVER, and INFLUENZA.

This remedy is made by passing thick bibulous paper through a solution of Nitrate of Potash, Chlorate of Potash, and other Chemicals.

DIRECTIONS.—Fold and place one or two pieces of paper on a dish and light the top as illustrated. A dense fume will then arise and gradually fill the room; and after inhaling it for a few minutes the air tubes will be cleared of mucus, the difficult respiration will cease, and the patient will fall into a sound and refreshing sleep. The outer air must be excluded by keeping the windows, doors, and chimney closed. The paper may be burned in the day as well as at night if necessary.

Price 2s. 9d., 4s. 6d., and 11s. per box.

Dr. Thorowgood, Physician of the City of London Hospital for Diseases of the Chest, in his "Notes on Asthma," page 62, says:—"The Ozone Paper prepared by Mr. Huggins contains nitrate of potash, chlorate of potash, and iodide of potassium, and of its efficacy I have had abundant evidence." Dr. Woodward, Worcester:—"Your Ozone Papers have given me more permanent benefit than any other remedy I have tried I have also found the same with regard to my Asthmatic patients."

Usual discount to the Profession and Trade.

Kidney and Abdominal Protector

M.D., F.R.C.S. Eng., writes:—

"This Protector is designed for the use of men and women. Covering the abdominal and pelvic organs, it will prove useful to those men who are exposed by their occupations to the vagaries of the weather, especially when the occupation involves sitting or standing for long periods. To adult women of all ages and to adolescent girls it will be a safeguard against the special ailments which are so liable to be brought on by exposure to cold." *From Principal Chemists.*

THE ANDERSON COLLEGE OF MEDICINE, GLASGOW.

(Founded in 1796 by the celebrated Professor JOHN ANDERSON.)

Situated at the gates of the Western Infirmary and the University of Glasgow. The Royal Infirmary is a short journey by car from the College.

The WINTER SESSION, 1917-18, will be opened on Monday, 15th October, 1917.

COURSES.—The Courses given in the College by the Professors, Lecturers, and Assistants are the following, and include systematic courses necessary to qualify in Medicine, in Dentistry, and in Public Health:—Junior, Senior, and Practical Anatomy; Experimental Physics; Chemistry, Lectures and Laboratory; Botany; Zoology; Physiology; Materia Medica and Therapeutics, and Pharmacy; Medical Jurisprudence; Midwifery; Diseases of Women; Surgery; Practice of Medicine; Ophthalmic Medicine and Surgery; Public Health, Lectures and Laboratory; Aural Surgery; Diseases of Throat and Nose; Mental Diseases; Dermatology; Dental Anatomy; Dental Surgery; Dental Bacteriology; Dental Metallurgy; Clinical Lectures; Hospital and Dispensary Practice at the Western Infirmary and the Royal Infirmary, under the Physicians and Surgeons of those institutions.

DEGREES AND DIPLOMAS.—Certificates of Attendance on the Classes at the Anderson College of Medicine are accepted by the Universities of London and Durham and by all the Royal Colleges and Licensing Boards in the United Kingdom. They are also recognised by the Universities of Glasgow and Edinburgh under certain conditions which are stated in the Calendar.

The Courses in Public Health (Laboratory and Lectures) qualify for the Diplomas granted by the Scottish Colleges, the Royal College of Surgeons, Ireland, and the Universities of Oxford, Cambridge, London, &c.

The fee for a lecture or a practical class is, in almost all cases, £2 2s. For exceptions and for full details regarding the classes see the Calendar. The Carnegie Trust pays the fees of students under certain conditions.

The College Calendar will be sent on receipt of a post-card addressed to the Secretary. The Anderson College of Medicine, Glasgow, W.

Founded 1894. ## THE INCORPORATED SOCIETY OF TRAINED MASSEUSES *Incorporated 1900.*

Arrangements have been made for the following Examinations to be held in 1917:—

Massage—London, Manchester, and Dublin, Dec.

Medical Electricity—Nov. (London, Manchester, and Dublin).

Swedish Remedial Exercises—Dec. (London).

Teachers' Certificate—October (London).

A Branch of the Society has been opened in Manchester, where Examinations are held and Lectures given.

The Society is approved by the Medical Profession, and its certificate-holders may not undertake cases without the permission of a registered practitioner. The Certificate of the Society is a qualification accepted by the Admiralty and the War Office, and nearly 2000 certificate-holders are working in Naval, Military, and Red Cross Hospitals, Convalescent Camps, &c.

For further information apply to the Secretary— 157, GREAT PORTLAND STREET, LONDON, W. *Telephone: MAYFAIR* 4189.

Appointment of Medical Officer of

HEALTH.—The Whitehaven Town Council and Rural District Council invite applications for the appointment of a Medical Officer of Health, to act within their respective Districts at a total inclusive salary of £500 per annum.

The person appointed will be required to undertake any duties which may properly be assigned to a Medical Officer whether these be imposed by law on the Authorities concerned or voluntarily undertaken by them. His duties will include the medical inspection of School Children within the Borough.

He will not be allowed to engage in private practice.

The proposed appointments will be open to members of the medical profession now serving with the Forces for the period of the War, and in the event of the appointment of one in this position whose services cannot be dispensed with by the Military Authorities, arrangements will be made for the discharge of the duties until the conclusion of the war.

Applications, endorsed "Medical Officer," will be received by the Town Clerk, Whitehaven, up to Saturday, the 3rd November next.

By order.
THOS. BROWN, Town Clerk.
E. R. CROASDELL, Clerk to Rural District Council.

Whitehaven, September, 1917.

The Prince of Wales's General Hos-

PITAL, Tottenham, N. 15. — Applications are invited for the post of SENIOR HOUSE SURGEON at the above Hospital.

Salary at the rate of 7 guineas per week, with residence, board, and laundry.

Candidates must possess the double qualification, and applications, with copies of three testimonials, to be sent to me on or before Monday, 15th October.

2nd October, 1917. FREDERICK W. DREWETT, Director.

Queen's Hospital for Children,

Hackney-road, Bethnal Green, E. 2. — Resident Medical Posts will fall vacant as follows:—

HOUSE PHYSICIAN, 17th January.
CASUALTY HOUSE SURGEON, 1st January.
HOUSE SURGEON, 1st January.

Six months' appointments. Salary £100 per annum, with board, residence, and washing.

Candidates should be doubly qualified, but applications from Fifth year Students will be entertained. T. GLENTON-KERR, Secretary.

1st Oct., 1917. Telephone: Dalston 305.

Kensington Board of Guardians.—

MEDICAL SUPERINTENDENT (Resident). — The Guardians require the services of a Medical Superintendent for their Institutions in the Marloes-road, at a salary of £650 per annum, with the use of the Medical Superintendent's house and furniture, coals, gas, electric light, and washing; such remuneration to include payment for vaccinations and the examining and certifying of lunatics. The appointment will be made for a period of one year subject to three months' notice being given on either side to determine the appointment.

Candidates must possess both a Medical and Surgical qualification, and be ineligible for the Army or Navy. The Doctor appointed will be required to devote his whole time to the duties of the office.

Forms of application can be obtained from the Clerk to the Board, Guardians' Offices, Marloes-road, Kensington, W. 8.

Metropolitan Borough of Bethnal

GREEN. — LADY ASSISTANT MEDICAL OFFICER OF HEALTH.—The Council invite applications for the appointment of a Lady Medical Practitioner as Assistant Medical Officer of Health (whole-time) primarily for the purposes of a Maternity and Child Welfare Scheme, at a salary of £400 per annum.

Candidates must be registered Medical Practitioners. Preference will be given to those holding a Public Health Diploma, but this qualification is not essential.

The appointment will be temporary, terminable at three months notice on either side.

Candidates must have had special experience in connexion with Maternity and Child Welfare work.

Applications, on forms which contain further particulars, to be obtained from the Medical Officer of Health, Town Hall, Bethnal Green, E. 2, accompanied by copies of not more than three recent testimonials, one at least bearing upon the candidate's experience in Maternity and Child Welfare work and organising ability, must reach me not later than noon on Wednesday, the 17th day of October, 1917, endorsed "Assistant M.O.H."

Canvassing, direct or indirect, will disqualify a candidate.

Town Hall, Bethnal Green, E. 2. DAVID J. KEAP, Town Clerk.

London Temperance Hospital, Hampstead-road, N.W. 1.—Applications are invited for the following post, which will be vacant on the 20th inst:—ASSISTANT RESIDENT MEDICAL OFFICER. Honorarium £120 per annum, with residence, board, &c.

Applications, with testimonials, should be addressed to the Secretary.

New Hospital for Women, Euston-road.—Wanted, Medical Woman for the post of RESIDENT MEDICAL OFFICER at the House of Recovery, New Barnet. Salary £60 a year, with board, residence, and laundry. Applications, with testimonials, should be sent immediately to the Secretary of the New Hospital. IMOGEN H. MURPHY, Secretary.

Nottingham General Hospital.—Wanted, a HOUSE SURGEON (Medical Woman). She will be appointed for six months. Duties to commence on the 1st of November, 1917. Salary to be at the rate of £250 per annum, with board and residence in the Hospital. Candidates are required to send testimonials, with particulars as to age, qualifications, and experience, to the Secretary. Applications must be delivered not later than the 11th of October. By order.

E. M. KEELY, Secretary.

Hampshire County Council.—ASSISTANT COUNTY MEDICAL OFFICER OF HEALTH.—The Hampshire County Council propose to appoint a Temporary Assistant County Medical Officer of Health for the period of the War, and invite applications from fully-qualified Medical Men or Women. Possession of a Diploma or Degree in Public Health will be considered an advantage. Salary £400, in addition to travelling allowances.

Applications, with copies of not more than three testimonials, upon a form which, with the conditions of appointment, may be obtained from the undersigned, must be delivered at The Castle, Winchester, on or before Monday, the 22nd October, 1917.

The canvassing of members of the County Council or any committee personally or otherwise, is strictly prohibited and will disqualify.

H. BARBER, Clerk of the County Council.

The Castle, Winchester, 3rd October, 1917.
